The special status of the Catholic churches of Eastern rite was guaranteed on union with Rome and was approved again by the decree *De ecclesiis catholicis orientalibus* of the second Vatican Council, promulgated on Nov. 21, 1964. Their organization is based on the special Oriental canon law of the period both of the undivided church and of their separation. In 1929 the Holy See undertook the codification of the Oriental canon law. The section *De personis,* which deals with the organization of the Catholic Eastern rites, was published in 1957 (*see* Canon Law: *Eastern Churches*).

1. Organization.—The supreme head of the Eastern rite churches is the pope. The central organ of the Holy See for them is the Congregation for the Eastern Churches. The prefect of this congregation is the pope himself, and a cardinal secretary performs the ordinary functions of chairman. The congregation is competent for the Oriental churches in all matters (except certain specified cases) and has exclusive jurisdiction in specified countries in Eastern Europe and the Middle East. The individual Catholic Eastern churches are organized differently according to their historical, ethnic, and political situation, the number of their faithful, the degree of their evolution, etc. The following organizational units are found:

Patriarchates.—These comprise a certain number of dioceses of a single rite, under the jurisdiction of a patriarch. The patriarchs, according to the Eastern canon law, have special rights and privileges; in the general hierarchy they rank after the cardinals and before all other bishops. In the 1960s there were six Catholic Eastern patriarchates. (*See* also Patriarch.)

Major Archiepiscopates.—Next to the patriarchs are major archbishops, who also govern a certain number of dioceses of their rite but whose territory has not yet been erected into a patriarchate. The only major archiepiscopate in the 1960s was Leopolis (Lvov, in the Ukrainian S.S.R.) of the Ukrainians, established in 1963.

Metropolitanates.—These correspond to an ecclesiastical province independent of the patriarchates and major archiepiscopates, and comprise a certain number of dioceses. One of them is the metropolis, and its archbishop, the metropolitan, is head of the whole metropolitanate. There are seven Catholic Eastern metropolitanates.

Eparchies.—These correspond to the Latin dioceses. Although they are usually subject to one of the above-mentioned higher organizations, six of them are immediately subject to the Holy See and two to a Latin metropolitan see (Hajdudorog in Hungary and Krizevci in Yugoslavia).

Exarchies.—These correspond to vicariates, and their bishops govern not by ordinary jurisdiction but by delegated authority. In the 1960s there were 12 apostolic exarchies (with authority delegated by the pope) and a few patriarchal exarchies or vicariates.

Apostolic Administrations.—These are territories whose administration the Holy See, for certain reasons, has assumed, entrusting them to the care of a neighbouring bishop or of a special bishop called apostolic administrator. This kind of organization is intended to be transitory, and in the 1960s there were only two.

Exarchical Monasteries.—These are exempt from the jurisdiction of a local bishop and subject immediately to the Holy See or to a patriarch. Grottaferrata, near Rome, was the only such monastery in the 1960s.

Ordinariates.—These, the lowest organizational units, are found either at an early stage of development, such as a mission, or in areas with a small number of faithful. Usually the head is not a bishop. Besides these, from 1950 onward four pluri-ritual ordinariates were instituted for the Eastern Catholics of some western countries (Argentina, Austria, Brazil, France).

2. Eastern Rite Churches.—The Catholic Eastern churches, grouped according to rites, are as follows:

Alexandrine (Alexandrian) Rite.—(*a*) Copts. In 1739 the Coptic bishop Athanasius joined the Catholic Church. In 1895 Pope Leo XIII reestablished the Alexandrine patriarchate for the Catholic Copts in Egypt, with the patriarchal residence in Cairo and two suffragan sees at Hermopolis Major (Al Minya) and Thebes (Sohag). In 1947 a fourth diocese, Lycopolis (Asyut), was erected. Catholic Copts number about 90,000.

(*b*) Ethiopians.—The faithful were won by the apostolate of Latin missionaries—Lazarists from 1839 and Capuchins from 1846. The first ecclesiastical organization was an ordinariate, erected in 1930 and entrusted to the care of an Ethiopian bishop, consecrated in Rome. In 1951 it was divided into two apostolic exarchies. Finally in 1961 the Ethiopian Catholic Church was organized into a metropolitanate, with Addis Ababa as its metropolis, Adigrat and Asmara (in Eritrea) being suffragan sees. The number of the faithful is about 60,000.

Antiochene (Antiochian) Rite.—(*a*) Syrians. In 1656 Andrew Akidjan, a Syrian Catholic priest, was elected bishop of Aleppo and in 1662 patriarch of all Syrians. However, the continuous series of the Syrian Catholic patriarchs of Antioch did not begin till 1782, when the Catholic bishop of the same city, Michael Giarweh, was again elected patriarch. The patriarchs resided successively in Deir al Zapharan, Sharfeh, Aleppo, Mardin (in Turkey), and finally in Beirut. There are four patriarchal vicariates or exarchies (in Lebanon, Turkey, Jordan, and Egypt), five archdioceses (Aleppo, Baghdad, Damascus, Homs, and Mosul), and one diocese (Hassake). The patriarch I. G. Tappouni (elected 1929) became the first Syrian cardinal in 1935. The faithful number about 80,000.

(*b*) Maronites. The Maronites of Lebanon are the only Eastern church which is completely Catholic (*see* Maronites). The patriarch was for many centuries the only hierarch, helped by several auxiliary bishops who resided with him. Dioceses were first formed in 1736. The patriarch resides in Bkirki and governs the diocese of Gibail-Batrun. There are further two archdioceses (Aleppo and Beirut), nine dioceses (Baalbek, Cyprus [residence in Antelias, Lebanon], Damascus, Byblos, Cairo, Saïda [Sidon], Sarba, Tripolis in Lebanon, and Tyre), and one apostolic administration (Laodicea) entrusted to the archbishop of Aleppo. The number of the faithful in the patriarchate is about 470,000 and there are about 380,000 in North and South America.

(*c*) Malankarese. In 1930 a group of the former Indian Jacobites in Kerala, South India, under the leadership of Mar Ivanios, returned to the Roman Catholic Church. In 1932 Pope Pius XI erected for them a metropolitanate, with Trivandrum as the metropolis and Tiruvalla as a suffragan see. These number about 125,000.

Chaldean Rite.—(*a*) Chaldeans. The Chaldeans of Iraq returned to the Catholic Church from Nestorianism (*see* Nestorians). The first union was realized in 1552, when the elected patriarch John Sulaqa went to Rome and made his profession of the Catholic faith. Other unions were realized in 1672, 1771, and 1778. For all Catholic Chaldeans there exists since 1830 the patriarchate of Babylonia. The patriarchal residence was at first in the monastery Rabban Hormizd, then in Mosul, and finally in Baghdad. Besides the patriarchal diocese of Baghdad, there are four archdioceses (Basra, Kirkuk, Sahneh—residence at Teheran—and Urmia, to which is united the diocese of Salmas) and seven dioceses (Aleppo, Alqosh, Amadiyah, Aqra, Beirut, Mosul, and Zakhu). There are about 190,000 Chaldean Uniates.

(*b*) Malabarese. The Malabarese are the Christians of St. Thomas in Kerala, South India (*see* Malabar Christians). For many centuries they were in close contact with the Nestorian patriarchate in Mesopotamia. They took up relations with Rome

on their own initiative after the Portuguese arrived in India. In 1887 Pope Leo XIII erected for them two apostolic vicariates and in 1896 a third. In the same year there were appointed the first three Malabarese bishops. There are two metropolitanates: the archdiocese of Ernakulam (1923), with Kothamangalam, Tellicherry, and Trichur as suffragan sees; and the archdiocese of Changanacherry (1956), with Kottayam and Palai as suffragan sees. Besides these in Kerala, there is in central India the ordinariate of Chanda (1962), which is a mission of the Malabarese rite. The faithful number about 1,500,000.

Armenian Rite.—The Armenian Catholic patriarchate originated in 1740, when the Armenian bishop of Aleppo, Abraham Ardzivian, already a Catholic, was elected patriarch of Sis in Cilicia (Turkey). In 1911 the Armenian church was divided into 19 dioceses, but during the persecution of the Armenians in Turkey (1915–18) several dioceses were abolished and the faithful left for other countries. In 1928 the hierarchical organization was revised and new episcopal sees were successively erected. The Armenian patriarch of Cilicia resides in Beirut (Lebanon) and personally administers that diocese. There exist further three archdioceses (Aleppo, Baghdad, and Istanbul), three dioceses (Alexandria, Isfahan, and Kamichlie [in Syria]), one apostolic exarchy (Paris, France), and two ordinariates (Athens and Gherla [in Rumania]). There are fewer than 100,000 faithful of the Armenian rite.

Byzantine Rite.—(*a*) Albanians. A small group of about 400 Albanians of Byzantine rite already existed in 1939 when the Holy See erected an apostolic administration for them. After 1945 this group was dispersed.

(*b*) Belorussians. In the 17th–18th centuries there were several million Belorussians of the Byzantine rite belonging to the Kiev metropolitanate. But after the annexation of their territory to Russia, the union was persecuted and finally abolished in 1839. After 1918 in Belorussia, which was then under Poland, several thousands of former Eastern Catholics returned to the Catholic Church and an apostolic visitor was appointed for them. After 1945 this group was dispersed. A few, however, emigrated to the West, and in 1960 they were given a bishop residing in London.

(*c*) Bulgarians. The small group of Bulgarians, heirs of the union of 1859, grew to about 80,000 but was later reduced to about 5,000. There is one apostolic exarchy in Sofia.

(*d*) Greeks. This small group of 2,550 originated in Constantinople and in Thrace about 1882. After 1920 a part of them settled in Greece. There are two apostolic exarchies, at Istanbul and Athens.

(*e*) Hungarians. These are heirs of the Union of Uzhgorod (1646). There is one diocese, Hajdudorog (1912, residence in Nyiregyhaza), and one apostolic exarchy, Miskolc (1923), both governed by the same bishop. There are about 250,000 faithful.

(*f*) Italo-Albanians or Italo-Greeks. These are heirs of the Albanians who emigrated to south Italy after the Turks seized Albania in the 15th century. All of them gradually and without any special juridical act were united with the Catholic Church. Part of them lost their Byzantine rite. Those who preserved it are organized in two dioceses, Lungro (in Calabria) and Piana degli Albanesi (in Sicily). To this rite the exarchical monastery of Grottaferrata near Rome also belongs. The faithful number about 70,000.

(*g*) Melkites (Melchites). The union of the Melkites in the patriarchate of Antioch originated in 1724 with the election of a Catholic patriarch, Cyril VI. He was followed by several bishops and about a third of the faithful. There were also some small accessions in the patriarchates of Alexandria and Jerusalem. There is only one Catholic Melkite patriarch, who bears the title of Antioch, Alexandria, and Jerusalem and governs all three patriarchates. In each he has his own diocese (Damascus, Jerusalem, Alexandria) and is helped by a patriarchal vicar. There are seven archdioceses (Aleppo, Beirut, Bozrah [Bosra], Homs, Laodicea, Tyre, and Petra–Philadelphia [residence at Amman]) and six dioceses (Acre [residence at Haifa], Baalbek, Baniyas, Saïda [Sidon], Tripolis in Lebanon, and Zahleh-Furzol). The number of the faithful in the three patriarchates totals about 250,000 and there are about 150,000 abroad.

(*h*) Rumanians. They were united with the Roman Catholic Church in 1698, when a union in Transylvania was stipulated by the bishop of Alba Iulia and the majority of the clergy. In 1930 a metropolitanate was erected with Făgăraş–Alba Iulia as the metropolitan see and Cluj–Gherla, Lugoj, Maramureş, and Oradea as suffragan sees. The union was officially suppressed by the government in 1948, at which time there were more than 1,500,000 faithful.

(*i*) Russians. About 1900 a small group of Russians joined the Catholic Church, preserving their Byzantine rite. In 1917 an exarchy was instituted for them, which was dispersed a few years later under the Communists. In emigration there is one Russian Catholic bishop, with residence in Rome.

(*j*) Ruthenians or Carpatho-Russians. The union effected in Uzhgorod in 1646 was the beginning of the general return of the Ruthenians to the Catholic Church. They had one diocese in Mukachevo (residence Uzhgorod), which was suppressed by the Soviet authorities in 1949. The number of the faithful in 1944 was 462,000. A considerable number of Ruthenians emigrated after 1880 to the United States, where they have two dioceses: Pittsburgh, Pa., and Passaic, N.J. The number of the faithful in the two U.S. dioceses is about 315,000.

(*k*) Slovaks. A minority of Slovaks belonged to the Byzantine rite between the Union of Uzhgorod (1646) and its abolition in Czechoslovakia by the government in 1950. They had one diocese, Presov. Many of them emigrated to North America, and in 1964 they were given a bishop as apostolic visitor, residing in Toronto, Ont.

(*l*) Ukrainians or Galician Ruthenians. These are numerically the largest Eastern Catholic church. They are heirs of the Unions of Brest-Litovsk (1596) and of Galicia (1700). After the partition of Poland, the part of this church that was assigned to Russia was eliminated in 1839 and in 1875. The part assigned to Austria was organized in 1807 into a metropolitanate, which in 1944 comprised the metropolitan see of Galich (Halicz) and Lvov (Lviv) and the suffragan sees of Przemysl, Stanislav (Ivano-Frankovsk), and Lemkyvcina. In 1946, after the occupation of the territory by the Soviet Union, this church was officially suppressed and the bishops imprisoned. In 1963 the Holy See elevated the metropolitan (later Cardinal) Josif Slipyj to the rank of a major archbishop. A great number of Ukrainians emigrated to both Americas and elsewhere. Their organization is as follows: the metropolitanate of Canada, with the sees of Winnipeg (metropolitan see), Edmonton, Saskatoon, and Toronto; the metropolitanate of the United States, with the archieparchy of Philadelphia, Pa., and the eparchies of Stamford, Conn., and St. Nicholas of Chicago. There are also the following apostolic exarchies: Australia (Melbourne), Brazil (Curitiba), France (Paris), England (London), and Germany (Munich). In the Ukraine the faithful number about 3,500,000; elsewhere there are about 750,000, including 280,000 in the three U.S. sees.

(*m*) Yugoslavs. The only Catholic diocese of the Byzantine rite in Yugoslavia, that of Krizevci in Croatia, contains faithful of different nationalities and heirs of different unions beginning in 1611. Their number is about 60,000. (M. Lo.)

II. THE CHURCH IN EUROPE

A. First Centuries

1. Preeminence of Rome.—Early in the history of the Christian church it came to be recognized that the human institution that is the fullness of the godhead bodily was to be governed on earth by a sacramental sovereign as agent or representative, the apostle or "vicar" of Christ. That this vicar of Christ should be the bishop of Rome belongs to the "logic of history." If, in "the fullness of time, God sent forth his son born of a woman," he selected the Roman Empire as the historical circumstance of that incarnation. The city of Rome was not merely the metropolis of humanity but the seat of an actual and formative sovereignty beyond comparison more effective and significant than that of any other imperial city. There if anywhere the City of God must encounter the "fullness of manhood bodily." (*See* Early Christian Church: *Organization.*)

Within a generation of the death of the apostles, Roman legions had destroyed the Temple at Jerusalem. Less than a century later the tradition of St. Peter's presence in Rome was, as Louis Duchesne stated, "precise and universal." Duchesne further declared that Dionysius of Corinth in Greece, Irenaeus in Gaul, Clement and Origen in Alexandria and Tertullian in Africa all referred to it, that in Rome itself Caius, about 200, pointed out the tomb of the apostles, that by the 3rd century popes built on their title of successors of St. Peter and that their right to this title is nowhere denied. Clement (*c.* 97) thinks it natural for the church in Rome to address a letter of advice to the church in Corinth upon the outbreak of schism. Ignatius of Antioch, late in the 1st century A.D., apostrophizes the Roman Church with a series of titles such as he addresses to no other. It is above all "a church presiding in charity, maintaining the law of Christ, and bearer of the Father's name."

2. Persecution.—The city of the Caesars and the Senate and people of Rome was the seat of the apostles; it was also the city of martyrs and heretics. Persecution and heresy contributed to the mature self-consciousness of the church. The offense of Christianity as defined by Trajan (*c.* 112) was of the nature of treason —otherwise harmless. The greatest persecutions, those under Decius (250–253), Valerian (257–260), and Diocletian (303–311), were virtual acts of war against "a sovereignty within a sovereignty" which seemed to threaten the empire. The danger would have been as real as it seemed but for the peculiar combination of faith and morals which enabled Christians to "dwell on earth as citizens of heaven" (*Epistle to Diognetus,* 2nd or 3rd century). They could thus pray for the emperor's welfare while they denied his divine title (Cyprian). Origen's confidence that Christ is stronger than the emperor, the army, and the Senate and people of Rome was inevitably and essentially Christian. The organic unity of the church was vigorous and visible in ceaseless missionary activity at every level of society and in every province. Christians nursed the sick, visited the prisoners, found employment for the idle, and cared for the poor, orphans, widows, and slaves.

All this, inspired and confirmed by a naïve sense of divine presence, omnipotence, and justice, gave the church not only authority over the whole life of its rapidly multiplying membership but an independence of imperial sanctions. The martyrs made explicit what the Christian faith had always implied, a totally new conception of the majesty of the human being as such and of human institutions. Constantine may have been a mystic, but he was certainly a political realist. Paganism died of its unreality. Julian's attempt to revive it in revolt against a corrupt and heretical Christianity (361–362) was no more than an adventure of sentiment and ideology.

3. Establishment of Orthodoxy.—Meanwhile the church defined its faith and established an orthodoxy. Definition is not, in the Catholic view, identical with the faith, but it is the means by which the faith becomes incarnate and available in the world and, as such, is implied in and authorized by the incarnation of God. It is thus conditioned by the "fullness of time" and is given to the church by the same authority that created the church, when and as the purpose of redemption and the existence of the church require it. So given it is infallible and final; but it is also the conclusion of a stage in the history of the church on earth, and its enunciation is prepared by a period of questions and uncertain or inadequate or controversial answers. The New Testament, whose canon was fixed *c.* 120, and the formulary known as the Apostles' Creed, used for the instruction of catechumens at the beginning of the 3rd century, both reveal the doubts and questions which assailed the primitive Christian. (*See* BIBLE: *Canon and Text: Canon of the New Testament;* CREED.)

The Gospels and the Acts were historical documents; the creed is a catalogue of facts. As against the Jews, the apostolic church proclaimed an eschatology which was no longer a promise but a present reality. As against the Docetism and Gnosticism (*qq.v.*) which represent the perennial reluctance to accept the faith as a fact, the New Testament and the creeds emphasized the event and the institution. Gnostic theories—those of Cerinthus, Valentinus, Basilides, Carpocrates, and others—were not and did not claim to be histories. They were cosmological myths and speculations, ingenious and sometimes profound metaphysical guesses, against which the primitive church affirmed the supernatural history and, in doing so, realized its own divinely appointed form and existence. Fact implied revelation; revelation implied authority and tradition; and all implied the presence on earth of God in the person of Christ and in the Holy Spirit who informed the Holy Catholic Church. Irenaeus (*c.* 186) finds the authority in "the tradition of the great and ancient church known to all men which was founded and constituted by the most glorious apostles Peter and Paul: by its traditions and its faith announced to all men and descended through the succession of its bishops to us, we confound all those who gather where they ought not" (*Adversus haereses,* iii, 381).

Irenaeus, who wrote against the Valentinians, gave also an account of all the principal heresies down to his time. Justin Martyr wrote, besides his *Apologia,* a work against all heresies which is lost. Hippolytus in his *Refutation of All Heresies* attacked 32 heresies. Epiphanius in the 4th century catalogued 80 heresies in the *Panarion.*

B. From Constantine to Charlemagne

Conversion of the emperor brought into the church all the problems of the empire. Of these the most urgent was the pagan habit of toleration expressed in the so-called Edict of Milan (313), issued in the name of Licinius and Constantine, that "everyone may have licence to worship whatever he pleases." (*See* CONSTANTINE.) Such toleration came to the Christians as relief, but imperial protection raised the old question of Christ and Caesar in a new, subtle, and dangerous form. It not only threatened to confound the church with imperial administration but exposed the faith to the speculative ingenuity and dispute endemic in the Greco-Roman world.

These two secular problems coalesced to make theology the subject of party strife. The teaching of Arius, according to whom the *Logos* was a creature not divine but free, mutable, and adopted as Son of God in prevision of his merits, revived the ancient reluctance of the philosophical pagan to accept the incarnation as a fact and relieved the Arian of the revelation and authority which faith in the supreme mystery demanded and presupposed. It was a rationalization not apostolic or holy or catholic, and the Christians who adopted it ceased to be Christian.

At the Council of Nicaea (325) the word *homoousios* ("consubstantial"), accepted to affirm the deity of Christ against the Arians, was probably suggested by Roman legates. Eusebius, bishop of Nicomedia, who, like Arius, had learned his theology from Lucian of Antioch, used the heresy of Arius as an occasion of intrigue. Without disputing the decrees of the Council of Nicaea he devised an imperial formula to comprehend Arians and Catholics and gained the support of Constantine and of his successor, Constantius (337–361), for a policy which seemed to promise imperial peace and actually promoted ecclesiastical dissension. This policy not only raised Arian bishops to most of the Eastern sees but meant also constant secret interference by bishops in the jurisdiction of their brother bishops, the employment of imperial prefects and police in the enforcement of partisan decrees, and the habit of using theological formulas not to define the faith but as instruments of ecclesiastical diplomacy. Thus by the carefully packed Council of Tyre (335) Athanasius, bishop of Alexandria, was deposed on frivolous charges and an Arian raised, with the aid of imperial police, to the see. At Antioch in 341 an assembly of 100 bishops issued an ambiguous formulary denying that they were followers of Arius but evading the Nicene Creed. Finally, in 359, imperial pressure enforced a similar evasion on the whole episcopate, both Western and Eastern, at the councils of Ariminum and Seleucia. In 360 the formula was accepted which "with a little complaisance Athanasius and Aetius might have repeated together"; and in 361 Constantius was succeeded by Julian, and Arian victory by pagan reaction.

Rome and the West remained comparatively free from the heresy and policy of the East. No longer head of the empire, Rome was still head of the church; the decline from its imperial

status emphasized its ecclesiastical independence. The bishop's residence was established on the Caelian Hill in the ancient house of the Laterani, owned by Fausta, Constantine's wife; and there Pope Miltiades held a council in 313. A basilica was raised, the existing Church of the Lateran. Athanasius, exiled from Alexandria, visited Rome. His news of Anthony, Pachomius, and the desert fathers kindled among wealthy Romans an interest in ascetic and monastic life which bore fruit in the next generation (*see* MONASTICISM); and in 340, before Pope Julius I and a council of 50 Western bishops, he was acquitted of the charges which had led to his deposition at the Council of Tyre. The Eastern bishops, who had asked to be invited to this council in Rome, nevertheless declined the invitation when it came. To their ultimatum requiring him to choose between Athanasius and themselves, Pope Julius replied that it was natural to hear complaints of bishops who said that they had been unjustly deposed; that in the absence of accusers he had examined the only available evidence, which they had themselves supplied at the Council of Tyre; and that he was concerned not with trifling stories but with the unity of the church.

(For the problems of this period of history, *see* further ARIUS; ARIANISM; ATHANASIUS, SAINT; COUNCIL; CONSTANTINE.)

1. Eastern Schisms.—Roman theology had not generated the controversial and speculative subtleties which divided the East. A schism left by persecution, between those who had endured and those who compromised with the pagans, had occasioned some disorder which was soon overcome. A greater schism, that of the Donatists (*q.v.*), rent the diocese of Carthage. To the historian its main interest lies in its effect upon Augustine, who during 16 years of controversy matured his conception of the Catholic Church. He was baptized by Ambrose in 387. Two years earlier Jerome had retired to Bethlehem to complete his translation of the Bible (Vulgate).

Ambrose, born at Trier about 340, son of the prefect of Gaul, became governor of Aemilia-Liguria (capital at Milan) in 370 and, on the death of the Arian bishop of Milan, Auxentius, in 374, was appointed bishop. (*See* AMBROSE, SAINT.) One of the best of Roman governors thus became one of the greatest of Christian bishops. His most significant task was to resist the inclination of the empire to control the church. Ambrose's friend Theodosius in 379 was made coemperor by the emperor Gratian, and in 380 was baptized a Catholic. In 381 he summoned a council to Constantinople (the second general council). Ambrose at the same time presided over a council at Aquileia.

Both councils condemned Arianism; Theodosius decreed that "all beliefs contrary to the faith clearly taught by the pontiff Damasus and by Peter, bishop of Alexandria, were heresy." The council also declared that "the bishop of Constantinople shall have the pre-eminence of honour after the bishop of Rome, for this city is the new Rome," thus founding ecclesiastical dignity on imperial status. Rome rejected this principle. In 383 Theodosius convoked a meeting of Catholic and Arian leaders, and upon its failure issued another edict, never strictly enforced, forbidding heretical worship, public and private.

The murder of Gratian (383) and the advance of Maximus through Gaul and Italy called Theodosius to the West, where, after the defeat and death of Maximus, he resided for nearly three years at Milan. The emperor Valentinian II also lived there, likewise under the personal influence of Ambrose. The bishop proclaimed and maintained the principle that "the emperor is within the church, not over the church."

Pope Leo (*q.v.*) was called upon to state once more and in uncompromising terms the fact in which and by which the Catholic Church exists. The Nestorian and Monophysite doctrines of the nature of Christ, both forms of the perennial desire to evade the central Christian dogma, had to be put down. The pope's definition, acclaimed by the Council of Chalcedon as "the voice of Peter," was an uncompromising statement:

> Following, then, in the footsteps of the holy fathers, we all teach in harmony that the Son and our Lord Jesus Christ are one and the same, one and the same perfect in godhead, the same perfect in human nature, true God and true man, the same made of a rational soul and body, consubstantial with the Father according to His godhead, consubstantial with us according to His human nature, made in all things like us without sin: according to His godhead begotten of His Father before all ages; the same in these last days for us and for our salvation born according to human nature of the Virgin Mary, the Mother of God; one and the same to be acknowledged as Christ the Son, the Lord, the only begotten, in two natures not removed by reason of their union, but rather the characteristics of each preserved united together in one person and subsistence, not divided nor shared among two persons but one and the same: Son, Only-begotten, God, Word, Lord, Jesus, Christ, as the prophets before had said of Him, as He Himself taught us and as the creed of the fathers has handed down to us.

In that statement, there is obviously no attempt to placate human reason and no appeal to human experience. Words are used to command a rational submission of faith to a fact which transcends reason. It is the voice of original authority, not a resultant explanation; foundation, not superstructure—"the stone which the Lord laid as a foundation." Man is whole, is perfectly and eternally human in Christ who is Very God. Nothing can violate the distinction between God and Man. The incarnation does not violate but transcends it, and it is thus not an evolution but the consummate act of transcendent godhead which the church announces and embodies. It purports to be a statement of the atonement and sacrifice in which human nature is restored to perfect unity with divine or absolute being. It is announced and accepted as fact by the Roman bishop, "the voice of Peter," at the Council of Chalcedon. Thus by the 5th century the church is fully conscious of itself as the issue of that supernatural union, wholly human, wholly divine. From that position there could be no retreat.

(For these controversies, *see* further NESTORIUS; MONOPHYSITES; CYRIL, SAINT [OF ALEXANDRIA]; JESUS CHRIST: *The Dogma of Christ in the Ancient Councils;* COUNCIL.)

2. Fall of the Roman Empire.—The fall of the Western Empire (476) completed the isolation of the Roman see. Arianism, expelled from the empire, had been established meanwhile among the Goths of the Danube by Ulfilas (*q.v.*), appointed their bishop by the Arian Bishop Eusebius of Nicomedia. Ulfilas taught a Gothic Christianity in the Gothic language, inventing an alphabet and translating the Scriptures. Untrammeled by orthodoxy, this faith needed no apostolic see and was adopted by Goths, Suebi, Burgundians, Vandals, and Lombards as a kind of national religion. (*See* GERMANIC PEOPLES: *Conversion to Christianity.*)

Gradually the West had been subdued by conquest and infiltration to the barbarian peoples: Africa to the Vandals, Spain to the Suebi and Visigoths, Gaul to the Visigoths and Burgundians. The Avars wasted Pannonia, the Slovenes Styria, Carinthia, and Carniola. The Croats and Serbs established themselves south of the Sava. Italy was defended by a barbarian army under Odoacer until his defeat and death in 493 at the hands of Theodoric the Ostrogoth, who, though an Arian, ruled Italy from Ravenna with ability and tolerance, with the advice of the Catholics Boethius (480–524) and Cassiodorus (*c.* 490–*c.* 585). After Theodoric's death (526) Italy was conquered by the armies of the Catholic emperor Justinian, under Belisarius and, later, Narses, and until the 8th century was officially a province of the Byzantine Empire under the exarch of Ravenna.

The Lombards conquered northern Italy and established themselves at Pavia (572). At once subject to repeated attacks from the Franks and extending their own conquests in Italy, the Lombards, unlike the Goths, had neither genius nor opportunity for peace. Thus when Gregory (*q.v.*) I the Great became pope in 590 he succeeded to what might be described as "the grave of the deceased Roman Empire." He had been praetor and then monk and had lived several years in Constantinople as the ambassador of Pelagius II seeking imperial aid against the Lombards. As Roman and as pope, he saw the world as a whole. Lawyer and judge by training, monk, bishop, and apostle by vocation, he realized the creative and redemptive possibilities of the papacy and of the Catholic Church at the moment when outside it and apart from its supernatural certainty all civilization in the west was dead beyond hope of resurrection.

(For details of the history of this period, *see* ROMAN HISTORY, to 476, and thereafter ITALY: *History* and ROME: *History. See* also separate articles on the barbarian peoples.)

3. Episcopacy and Monasticism.—During the next six centuries the function of the church was to create Christendom, and its chief instruments in this work were episcopacy and monasticism. During Gregory's pontificate the Arian rulers of the Lombards in Italy and of the Visigoths in Spain were baptized Catholics. In 597 his mission landed in Kent under Augustine of Canterbury. A century earlier (496 or, more likely, 506) Clovis (*q.v.*) with 3,000 Franks had been baptized by St. Remi, bishop of Reims, and was exhorted by Avitus, bishop of Vienne, to spread the faith among the barbarians "corrupted by heretical doctrines." Even as a pagan Clovis had respected the property, person, and advice of bishops, and he owed his conversion partly to the prudence which recognized in them the virtual rulers of Gaul. He broke the power of the Visigoths at Vouillé near Poitiers and extended his dominion to the Pyrenees, everywhere requiring Arians to become orthodox and restoring their churches after they had been reconsecrated.

In the 5th century the monk St. Severinus, a friend of Odoacer, established the authority of personal sanctity over the peoples of the upper Danube. During the 7th, 8th, and 9th centuries the Croats were Christianized by Roman missionaries; the Bavarians of Upper Austria by St. Rupert of Worms, who founded a see and a monastery at Salzburg (*c.* 700) that Charlemagne made an archbishopric (798); Moravia by the Greek monks Cyril and Methodius; and Bohemia by its prince, whom St. Methodius baptized (871). Prague became a see in 973. The Magyars, who had withstood a succession of missions from East and West, were at length converted under Stephen I, who established the metropolitan see of Esztergom (Gran) and founded the monastery of Pannonhalma near Gyorszentmarton (Martinsberg) with five other houses.

Monasticism was the Christian equivalent of the imperial army, the means by which the church subdued and enlisted, colonized, and administered the new peoples and revived or defended the old. The first great leader of Western monasticism, St. Martin of Tours, was a Pannonian, born of pagan parents and bred a soldier; he secured his discharge in order to renounce the world. Under St. Hilary of Poitiers, himself a convert, Martin established a monastery at Ligugé and another at Marmoutier on the banks of the Loire. As monk and bishop of Tours he devoted himself to an ascetic discipline and to the conversion of pagans. Other monastic communities gathered at Marseilles (St. Victor) and on the isle of Lérins (St. Honoratus or Honoré) whence another St. Hilary was appointed bishop of Arles (429). About 480 was born St. Benedict of Nursia, whose *Regula monachorum* or "Rule for Monks" became the pattern of all Western monasticism. (*See* BENEDICT, SAINT: *Rule of St. Benedict.*) "For thee, therefore, whosoever thou be, my words are intended who, giving up thy own will, dost take the all-powerful and excellent arms of obedience to fight under the Lord Christ, the true King." In that conception of service and society lay the seeds of the rivalry between natural and supernatural sovereignty which appeared full-grown in the 11th and 12th centuries.

The Rule established a discipline and constitution and regulated a liturgical society with impersonal precision. It represented the religious as the *Institutes* of Justinian (*see* ROMAN LAW) represented the civil society. The Rule required self-surrender rather than self-abnegation. Based on long monastic experience and devotion to the person of Christ (who is to be seen and served in the abbot and in all the brethren, in strangers who visit the monastery and in all its life and work), it was the perfect instrument for creating centres of Christian society, above all in rural and pagan territory, and for reforming the religious communities of the West. Thus a rational economy, moral training, and education in the arts of peace developed about the altars of the church and were available to transform the secular barbarity of war and heroic solitude into Christian civilization.

4. The Rise of Temporal Power.—In the civilized East the Christological discussion continued. The pope, though a subject of the (Byzantine) emperor, was head of the church, and the East, always divided in faith, had always been uncertain in ecclesiastical submission. The churches of Egypt and Syria, strongholds of Monophysite theology and jealous for the dignity of Alexandria, had refused the decision of the Council of Chalcedon. The emperor Zeno tried an accommodation, the Henoticon (482). The emperor Justinian, a Macedonian Catholic, in the controversy of the "Three Chapters" (*see* PAPACY: *The First Six Centuries: The Affair of the "Three Chapters"*), forced the aged Pope Vigilius to attend the fifth general council at Constantinople (553) and to assent to the condemnation of Theodore of Mopsuestia, Theodoret of Cyrrhus, and Ibas of Edessa, three writers who had been accused and acquitted of Nestorian heresy at Chalcedon. The emperor Heraclius tried the formula known as Monothelitism (*see* MONOTHELITES) which ascribed one "active energy" to the Saviour, translated by the Latin bishop as "one will"; and Pope Honorius, mistaking the question, professed himself willing to assent. Pope Martin I refused this concession and was exiled by the emperor Constans II to the Crimea. The sixth general council (680–681) vindicated Martin, condemned Monothelitism, and criticized Honorius. Nevertheless, in 692 the council *in Trullo* (Quinisext) was deliberately anti-Roman, and Pope Sergius, arrested at the orders of Justinian II, was saved only by force from the imperial officer. Finally the emperor Leo III the Isaurian (717–740) had initiated his campaign of iconoclasm, the most unpopular and unnecessary of reforms, enforced by persecution and confirmed by the Council of Hieria in 754. The schism endured until 843. (*See* also ICONOCLASTIC CONTROVERSY.)

But the emperor, if he was willing to force the Roman bishop to submit in matters of doctrine, was quite unable to defend his Roman subjects from their enemies in the flesh. It was out of long Roman experience that Pope Zacharias, in reply to Pepin's question, answered that the king should be he who really has power to rule. (*See* PAPACY: *The Medieval Papacy* [*590–1304*]: *The Carolingians and the States of the Church.*) Neither Roman nor Byzantine sovereignty had been bound by a doctrine of legitimacy: the prince was the guardian of law and peace. In Rome the bishop and the people were bound together by ties of faith, history, and administration. The walls, defenses, aqueducts, food, hospitals, finance, justice, and religion were in the bishop's charge.

Not only the city but the West as a whole was in need of defense. In 711 Spain and Sardinia had fallen to the Arabs. Sicily was frequently raided by Saracens, who exacted tribute from Syracuse. In 732 Charles Martel (*q.v.*) broke the Muslim invasion of France, saved Aquitaine, and established his title as defender of Christendom. Thus, when, in 751, the Lombard Aistulf seized Ravenna, threatened Rome, and meditated the conquest of Italy, Pope Stephen II (III), having appealed in vain for help to the emperor, turned to Pepin the Short. He journeyed into Francia, prevailed upon Pepin to help him, and, returning to Italy with the army of the Franks, received Ravenna from Pepin, who destroyed the Lombard forces (756). Charlemagne completed the conquest by capturing Pavia (773–774).

(This pivotal period of European history is discussed at length in CAROLINGIANS; LOMBARDS; FRANKS; PEPIN; CHARLEMAGNE; FRANCE: *History.*)

Thus the pope became a sovereign prince. His "temporal power" was the consequence of an inevitable severance of West from East, of the barbarian and Muslim invasions, and of his apostolic function to maintain the faith as against the heresies and schisms which were endemic in the eastern imperial system and to evangelize the pagans of the West.

Charlemagne, after 800, was not only Augustus but "crowned of God, great and peace-bringing emperor who rules the Roman Empire and who by the grace of God is king of the Franks and Lombards." For 30 years he made holy war on the pagan Saxons, and when he died in 814 his empire, extending from the Elbe to the Pyrenees, from the English sea to the Tiber, was united in so far as it was Christian. His school under Alcuin of York was the cultural centre of this empire.

Louis I the Pious, crowned at Reims by Stephen IV (V) (816), cooperated with Pope Paschal I in his desire to convert the Danes. The archbishop of Reims, the bishop of Cambrai, and a mission of monks under Ansgar spread the faith about the mouth of the Elbe. (*See* ANSGAR, SAINT.) In 826 the Danish prince Harald

with many hundred followers was baptized at Mainz. Meanwhile, St. Benedict of Aniane, having reformed the monasteries of Aquitaine, was brought to advise Louis on the moral reform of the kingdom and was established in a monastery at Aachen. Under his influence the Rule of St. Benedict was imposed on all monastic houses in the Frankish kingdom.

C. The Formation of Western Christendom

At the death of Louis the Pious (840) the natural divisions of the empire and local needs, attachments, and traditions were reasserted. The idea of empire, derived from Rome, taught by Alcuin of York, and realized by the genius of Charlemagne, receded. Beginning in the 8th century, the invasion of the Normans intensified the confusion of dynastic war. (*See* Viking; Normans.) Based in Flanders, they ravaged Saxony, the Rhineland, and France, burned Cologne, Rouen, Paris, and Aachen, captured Trier, besieged Orléans, seized Bordeaux, and advanced on Toulouse. They sacked the monasteries and completed the destruction of towns and communes surviving from Roman times. The Edict of Mersen (847) commanding every man to serve a lord only defined the actual situation; feudal organization was partly, if not mostly, a defense against the anarchy the Normans left behind. (*See* Feudalism.) Early in the 10th century they settled in Normandy. Two centuries of war thus isolated and established the church in the West as the one continuous, unifying, and civilizing institution and, as it were, defined its double function of evangelizing and civilizing mankind.

This isolation of the West was emphasized by the schism of Photius in Constantinople during the pontificate of Nicholas I. The elevation of Photius (*q.v.*), a layman, to the patriarchate and the deposition of Ignatius, his predecessor, were uncanonical. On the other hand, the interference of the Roman legates in the newly founded Bulgarian Church was perhaps unlawful. The *Filioque* question (the double procession of the Holy Ghost) was used mainly as an occasion, though the theological difference between East and West is implied in the dispute. (*See* Holy Spirit: *Procession of the Holy Spirit.*) As always, the West was more simply and uncompromisingly Trinitarian and laid greater emphasis on the incarnation with its consequent exaltation of the church. Nicholas (*q.v.*) I, a canonist and political realist, advanced from the traditional Gelasian doctrine of "two swords"—that is, of the divine origin and independence of both the spiritual and the temporal power—to that which foreshadowed the doctrine of the primacy of the spiritual power, successfully advanced by Hildebrand (Gregory VII). To the emperor Michael III Nicholas wrote that, whereas the emperor needed the pope in religion, the pope had no need of the emperor in temporal matters. At the same time he demanded obedience from the Frankish king Lothair and even quashed a judgment of the great archbishop Hincmar of Reims and declared that what the pope decides all must observe. For a century, however, the Roman see, lacking temporal protection, suffered from its temporal status. The Roman nobles, the house of Spoleto, the counts of Tusculum, and the kings of Germany made and unmade popes in a succession down to John XII, deposed by Otto the Great in 963.

Weakness at the centre encouraged and exaggerated the centrifugal tendencies revealed in the wide, half-civilized rural areas that were exposed to waves of pagan and barbarian invasion. The urban organization of the church in the Roman Empire was not suited to this scattered and insecure continent. The church needed an imperial idea and the cooperation of temporal powers. During the 10th century the house of Saxony laid the foundations of the medieval empire, Cluny revived monasticism, and the canon law was gradually developed; and these three factors, together with intensified theological controversy, prepared the great reform of the 11th century, which was initiated by a reformed papacy.

1. Foundation of the Medieval Empire.—Otto I (*q.v.*) the Great, occupied during the first 25 years of his reign in uniting the German peoples and defending them against Hungarians, Slavs, and Normans, was crowned emperor in 962 by Pope John XII in Rome and thereafter was employed in restoring order in Italy. He founded a metropolitan see at Magdeburg, whose first archbishop, Adalbert, monk of Trier and abbot of Weissenburg, had been missionary to the Russians. Bishoprics were founded also at Oldenburg and Havelberg (946), at Prague (976), at Olomouc (Olmütz; for Moravia) and at Odense (for Denmark; 980). In 936 St. Unni of Bremen undertook a mission to Scandinavia, where he died. The second bishop of Prague, St. Adalbert (Voytech), who baptized St. Stephen of Hungary, left his see in defiance of papal and imperial injunction to preach the gospel to the Prussians, by whom he was martyred in 997. The frontier churches of Bohemia, Hungary, and Poland looked to Rome rather than to Germany; and Pope Gregory V, cousin and chaplain of Otto III, revived the missionary tradition of the Holy See but fell a victim of city faction prompted by local nobles.

At his death in 999, Otto III appointed the Frenchman Gerbert of Aurillac (Silvester II). Silvester dreamed of an empire independent of the German kings which should embody a world faith and a world culture. But like other learned men he underestimated local ties and traditions, and like other Frenchmen he failed to realize the needs of German administration. Simony (*q.v.*) he counted the greatest evil in the church. But it was much more than the "sin of Simon Magus": in France it was, indeed, a corruption which was the result of generations of insecurity strengthening the hands of unscrupulous lords; in Germany it was rooted in Teutonic and feudal custom and continued by social and economic necessity.

The spread of Christianity among remote and barbarous peoples implied local autonomy and the adaptation of ancient pagan administrative custom. Churches were built, maintained, and possessed by chieftains. The mission church was virtually autonomous; its priest was the vassal and servant, often the kinsman, of the local landowner and protected by the local saint. The Holy See itself was constantly subject to imperial interference and protection, and the great reformer Leo IX, though elected at Rome, was Henry III's nominee. At every level—parochial, episcopal, papal—the question awaited decision whether the church was in effect a holy, catholic, and supernatural institution appointing its own bishops and priests upon its own authority or (in the language of a later age) part of the body politic.

The system evolved by nature was subject to natural corruption. The emperor Conrad II and King Philip I of France made a traffic of bishoprics. But deeper than these abuses was the question, presupposed in all movements of reform, of the true function of Christian priest and bishop. Councils repeatedly forbade lay interference in parochial benefices (Ingelheim, 948; Augsburg, 952; Seligenstadt, 1023; Bourges, 1031). Linked with this question was that of clerical celibacy, since a married clergy was tied by natural duties and interests to worldly affairs. (*See* Celibacy.) Marriage implied inheritance and tended to absorb the clergy in local and feudal tenancies and obligations. But there was also the question of sexual morality and the traditional attitude of the church to virginity. Celibacy was admired by Tertullian, recommended by Eusebius, required by Cyril of Jerusalem, and said to be the general practice by Jerome. Celibacy was a tribute to the supernatural and sacramental vocation and as such was bound up with the supernatural and sacramental body which the confusion and expansion of the 9th and 10th centuries tended to obscure.

2. Revival of Monasticism.—Monks were the exemplars and instruments of the supernatural society. It was their business to live in "the course of these declining times" as in and for the "solid estate of eternity." Monasticism (*q.v.*) was in essence a lay movement, and the multiplication of monasteries and the constant succession of monastic reforms was evidence of the hold of the Catholic faith on the lay population. In 910 William I the Pious, count of Auvergne and duke of Aquitaine, founded Cluny (*see* Benedictines: *Monastic Centuries*). Odo of Cluny reformed Fleury and then, invited to Rome by Alberic, reformed the monasteries in and about the city and Monte Cassino. The reform spread through northern Italy and France. Cluny became the head of an order whose 300 houses, subject to the abbot of Cluny and exempt from all other authority but that of the pope, were organized in ten provinces extending from Spain to Poland.

Cluny, "a spiritual field where earth and heaven meet" (Peter

Damian), trained Urban II and Paschal II. It not only revived liturgical discipline and the Benedictine rule but realized on a world scale the practical order and common prudence of Benedictine monasticism. At the same time, Gerard of Brogne in Flanders and Dunstan of Glastonbury in England initiated monastic reform. In Italy St. Romuald founded the order of Camaldoli (*c.* 1012; *see* CAMALDOLESE). In Normandy Herluin founded Bec (*c.* 1040), which under Lanfranc and St. Anselm became one of the great schools of Europe. There Pope Alexander II, Ivo of Chartres, and Theobald of Canterbury received their training. The last wave of monastic reformation produced the Carthusian order founded by St. Bruno (1084) and the Cistercian founded by Robert of Molesme (1098), Alberic, and Stephen Harding. St. Bernard entered Cîteaux in 1112 or 1113 and with 12 monks founded Clairvaux in 1115. He was the "greatest of the monks" and one of the greatest preachers of the Middle Ages. (*See* CARTHUSIANS; CISTERCIANS; BERNARD, SAINT.)

3. Development of Canon Law.—In the West canon law developed later and more slowly than in the East. In 774 Charlemagne received from Pope Adrian I a collection of canons and decretals accepted at the Council of Aachen (802) by the Frankish church. Under the see of Toledo the Spanish church possessed a larger collection, including canons of Greek, African, Gallic, and Spanish councils and papal decretals. In the 9th century also appeared the collection of "false decretals" (*see* DECRETALS, FALSE). This collection, containing both real and spurious decretals, circulated in Spain, Italy, France, and even England but was not much used in Rome till the 11th century. Collections made by Burchard of Worms and Ivo of Chartres prepared the way for Gratian (*q.v.*), a Camaldolese monk of Bologna, who in 1139–*c.* 1150 produced the *Decretum,* a systematic treatise (*Concordia discordantium canonum*). During the 12th and 13th centuries five compilations were added. Gregory IX added the decretals of popes since the *Decretum* which were compiled by the Dominican Raymond of Peñafort. Later decretals were collected by Boniface VIII (1298) and Clement V (1314), and the *Extravagantes* (decretals not included in previous compilations) brought the law down to Sixtus IV (1484). These together formed the *Corpus juris canonici* ("body of canon law"), of which a definitive edition was issued by Gregory XIII in 1582. (*See* further CANON LAW.)

4. Theological Controversy.—St. Augustine of Hippo developed his doctrine of the church against the Donatists (*q.v.*) and his doctrine of grace against Pelagius (*q.v.*), but both doctrines were already full-grown, and the fundamental reason for his exposition lay in the need of the man Augustine, a sinner in need of grace and the citizen of a dying civilization in need of the City of God. In other words, the power and permanence of Augustinian theology was the result of his factual presentation of man as man in relation to his Maker and Saviour. The West, untroubled by the complicated disputes and theological parties of the East, developed its theology in simple and universal terms, not as a theory so much as a faith. At the Second Council of Orange (529) the Semi-Pelagians were condemned. (*See* SEMI-PELAGIANISM.)

The question of predestination and depravity was raised in the 9th century by Gottschalk (*q.v.*), a monk of Fulda, whose doctrine of a double predestination was condemned by Rabanus Maurus of Mainz and Hincmar of Reims. But the doctrine of grace developed more surely and continuously as the doctrine of the Eucharist, and here also the church insisted on the reality of the sacrifice. For Ambrose it is Christ himself who offers the sacrifice and changes the elements into his body and blood. For Augustine the church presents itself as a whole and living sacrifice. Gregory says that the daily offering of Christ's body and blood avail for salvation and that by this means "the lowest things are united to the highest, things earthly are joined to things divine and the visible and invisible become one."

In the 9th century Paschasius Radbertus (*q.v.*), monk and abbot of Corbie, wrote a treatise *De corpore et sanguine Domini,* which in 844 he presented to Charles the Bald, emphasizing the fact of the real change into the body and blood of Christ and equating the daily sacrifice with daily redemption. Another monk of Corbie, Ratramnus (*q.v.*), at the same time described the sacrifice as "spiritual" and discussed the relation of "figure" and "truth" in a work afterward attributed to Johannes Scotus Erigena and condemned during the Berengarian controversy at Vercelli in 1050. Berengar (*q.v.*), *scholasticus* and archdeacon of Tours, outlined his doctrine in a letter to Lanfranc, and Lanfranc set forth the orthodox doctrine in his book *De corpore et sanguine Domini.*

The Christology of the Western Church was settled at Chalcedon. The Adoptionist heresy of Felix, bishop of Urgel, and Elipandus of Toledo was repeatedly condemned and was answered by Alcuin of York, who said that the Sonship of Christ is not of nature but of person: the divine and human natures are united in the person of the Son. (*See* ADOPTIONISM.) During these centuries the West developed the devotion to the Virgin Mary defined at the Council of Ephesus (431) and at Constantinople (553). The devotion to the Mother of God became articulate and instituted as the doctrine of the incarnation was defined. The same uncompromising refusal to adapt the central mysteries of the faith or to modify them in the interests of rationalization appears through all the centuries of Christological dispute and social chaos. The sacrifice is a real sacrifice, the Saviour really present, the incarnation the real fullness of the godhead bodily, the church the really divine-human community, and its head the real and effective sovereign, vicar of Christ.

5. Papal Reform.—This realism, the mark of Christian orthodoxy, is the heart of the work of St. Anselm (*q.v.*). His use of the ontological argument is thus the opposite in emphasis of the Cartesian: its essence is the emphasis on existence. His *Cur Deus homo* starts from divine justice, and his argument presupposes its absoluteness. Faith is the foundation of reason.

Leo IX.—The same unyielding realism of faith was expressed in the papal reform initiated in the 11th century by Leo IX: "The head of the entire discipline of the church is in that place where Peter, the summit and cardinal member of the apostles, waits for the blessed resurrection of his flesh in the last day."

Leo IX had learned administrative method in the imperial service and his episcopal duty in a poor diocese. During the first two years of his pontificate he held 12 councils. He traveled to Reims, to Mainz, and as far as Hungary, organized the papal chancery to sustain a large correspondence, employed highly able legates, and created a college of cardinals. He dreamed of the reunion of East and West. He brought to Rome young Hildebrand (later Gregory VII), who had known the city's disorders as a boy and who devoted the remaining years of his life to the reform. Stephen IX (X) (Frederick of Lorraine) was already dying when he left Monte Cassino for the chair of Peter, but in his few months he consecrated the monk St. Peter Damian cardinal bishop of Ostia, secured the cooperation of cardinals and Roman burghers to ensure the canonical and independent election of his successor, and enjoined upon them to await the return of Cardinal Hildebrand, then in Germany. Stephen was no sooner buried than the Roman nobles proved his wisdom by electing an antipope whom the cardinals excommunicated, appointing the Burgundian bishop of Florence, Nicholas II. At his death (1061) the struggle came to a head between the reforming cardinals and the bishops of Lombardy led by Milan. The cardinals elected Anselm of Lucca, Lanfranc's pupil at Bec, as Pope Alexander II. But it was only after bloodshed and an appeal to the German court at Augsburg, and even then at the risk of his life, that Alexander began his pontificate. (*See* further PAPACY.) Nevertheless, the reform was already visibly changing the relations between church and state.

Gregory VII.—Gregory VII, who as monk, deacon, cardinal, and pope served this cause for 40 years, was perhaps alone in his vision of all its meaning as, after 1072 (when Peter Damian and Adalbert of Bremen died), he was the sole survivor of Leo IX's circle of reformers. For him the battle was no longer limited to simony and celibacy. Likened by his contemporaries to the prophet Elijah, he was disinterestedly certain that the pope is the voice and speaks with the authority of Peter and claimed absolute authority over the souls of Christians without misgiving and without arrogance. As legate he had seen the church in France and Germany with the eyes of central authority. The arch-

chancellor of the empire, who was also archbishop of Mainz, complained that Pope Alexander II had dealt directly with his suffragans of Prague and Olomouc instead of dealing through their archbishop. Liemar of Bremen refused to act at the orders of papal legates without consulting the German episcopate. Secular clergy revolted against a decree of celibacy. Only the Saxon bishops supported the pope, and that because they were opposed to the emperor. In 1075 Gregory revealed his determination: by the *Dictatus papae* he declared (renewing an earlier and never enforced decree) that no prelate might receive an abbey or see at the hands of a lay lord and asserted his power to depose any bishop or lord who might defy him.

Henry IV, the German king, having subdued the Saxons, was free to attack the pope. In 1076, at a council of German bishops held at Worms, he declared Gregory deposed, and the north Italian bishops declared their agreement. Gregory then deposed and excommunicated the German and Lombard bishops who had signed Henry's letter, declared Henry deposed and excommunicated and his subjects absolved of their allegiance. The effect of this open clash was Henry's defeat and isolation, which he saved from complete disaster by submitting to Gregory at Canossa (1077). There he did penance and awaited absolution, which Gregory gave in duty as a priest. The absolution disconcerted the papal party in Germany which had elected Rudolph of Swabia king in Henry's place. But now Gregory, who was not a partisan, remained neutral. Three years of civil war ended with the victory and death of Rudolph and the excommunication of Henry, who marched on Rome and was crowned by Guibert of Ravenna (the antipope Clement III). Gregory "having loved justice and hated iniquity therefore died in exile" at Salerno in 1085. In France, his campaign against simony and clerical marriage had been more successful. In England, Lanfranc carried out his policy but with a characteristic independence.

Crusades and University of Paris.—Urban II, after the brief pontificate of Victor III, inherited Gregory's exile and carried on his work. A monk of Cluny and a canonist, he had been employed as legate in Germany to organize the papal party. More firmly than Gregory he maintained the opposition to lay investiture and required free and lawful election of bishops. Deprived at first of his centre at Rome, he held a number of councils. At Clermont (1095) he forbade clergy to do homage to laymen and proclaimed the first Crusade (*see* CRUSADES), which, apart from its particular occasion and important results, inspired the first great movement of popular preaching. Urban employed permanent legates, encouraged appeals to Rome, graded the hierarchy and confirmed the privileges of monastic houses.

At the same time the emergence of an international school at Paris recovered scientific theology for Western Christendom. Guillaume de Champeaux established the reputation of the cathedral school. Peter Abelard, who had studied under Guillaume, made it the most famous school in Europe and, using the *Organon* of Aristotle, laid the foundation of its tradition as a school of logic and philosophy. (*See* also PARIS, UNIVERSITY OF.) By the middle of the 13th century the schoolmen of Paris had access to original translations from the Greek of nearly all Aristotle's extant works. Forbidden by the legate Robert de Courçon in 1215 and again in 1231, the physical and metaphysical works of Aristotle, together with the commentaries of Averroës, were nevertheless read and studied. (*See* SCHOLASTICISM.)

6. Heresy and Inquisition.—At the fourth Lateran Council (1215) Innocent III published a definition of the faith which, after affirming the doctrine of the Trinity, the incarnation, and the judgment, says:

> There is moreover one universal Church of the faithful, outside which no man at all is saved, in which the same Jesus Christ is both the priest and the sacrifice, whose body and blood are truly contained in the sacrament of the altar under the species of bread and wine, the bread being transubstantiated into the body and the wine into the blood by the divine power, in order that, to accomplish the mystery of unity, we ourselves may receive of His that which He received of ours. And this thing, the sacrament to wit, no one can make (*conficere*) but a priest, who has been duly ordained, according to the keys of the Church, which Jesus Christ Himself granted to the apostles and their successors.

But the sacrament of baptism, which is consecrated in water at the invocation of God and of the undivided Trinity, that is of the Father, and of the Son and Holy Spirit, being duly conferred in the form of the Church by any person, whether upon children or adults, is profitable to salvation. And if anyone, after receiving baptism, has fallen into sin, he can always be restored (*reparari*) by true penitence.

Not only virgins and the continent, but also married persons, deserve, by right faith and good works pleasing God, to come to eternal blessedness (cited by Alexander Hamilton Thompson, *Cambridge Medieval History*, vol. vi, p. 635).

The last article of the definition quoted above refers to the Catharist or Albigensian heresy, which in the 12th and 13th centuries threatened large areas of Hungary, Germany, Italy, and France. (*See* CATHARI.) In Languedoc the Crusades inaugurated by Innocent III against the heresy were eagerly supported by the French nobility (1209–44). At the same time the Inquisition was organized. Proposed at the Council of Verona (1184) and established early in the 13th century, this court was designed to combine judicial procedure with propaganda. Under Gregory IX it was organized with specialist judges and advisers. Its activity varied with time and place. In an age whose most important industry was definition, in which social discipline and civilized living had still to be won, there could be no question of indifference. The enemies of faith were the enemies of man. (*See* INQUISITION.)

7. The Pattern of Catholic Humanism.—The 13th century was the age of an apostolate at every level of human life. The leaders of the movement were friars, orders initiated by laity (St. Francis) and the lower ranks of clergy (St. Dominic) under the immediate protection of the pope. In 1210 Innocent III sanctioned the Franciscan rule. In 1216 his successor, Honorius III, took under his government and protection "the order of Master Dominic and Friars Preachers." (*See* FRANCISCANS; DOMINICANS.) The Swabian Albertus Magnus, regent master of the learned order of Dominicans in Paris, "strove to make Aristotle intelligible to the Latins." His pupil Thomas Aquinas is still the "common doctor," the greatest teacher of the Roman Catholic Church. Leo XIII in the encyclical *Aeterni Patris* (1879) required bishops "to restore the wisdom of St. Thomas and to spread it as far as possible for the safety and glory of the Catholic faith, for the good of society and for the increase of all sciences." It was the work not only of St. Thomas but of the 13th century as a whole to synthesize those three purposes. (*See* THOMISM.)

In Paris, the metropolis of theological and philosophical controversy, and at the moment of the full recovery of Aristotelian method, St. Thomas (*see* AQUINAS, SAINT THOMAS) represents the arrival of scientific intelligence and the discovery by Christendom of the nature of man. His work is the first clear articulation of the full human confidence in human nature which in patristic and conciliar definitions, as in the earlier scholasticism of St. Anselm and in the preaching of St. Bernard, was still overshadowed by theological, controversial, and ecclesiastical purpose. St. Thomas realized what neither pagan philosophy nor Christian theology had as yet clearly discerned, the naturalism of supernature, the divine right of man.

8. Papal Authority.—Whether the claim of Nicholas I, Gregory VII, and Innocent III to an effective sovereignty of Christendom was theoretically sound or not, the civilization of the West did in fact cohere in the church which cohered in the papacy. The papal victory of the 11th century, the development of law, theology, and ecclesiastical order, had made the Holy See the centre of a judicial and administrative system not only more efficient than any other government but the basis of all government. It was the final court of appeal in international dealing, the source and standard of ministerial and judicial competence. The pope's authority was also popular and moral. Innocent III, feudal suzerain of a large part of Europe, exercised also as head of the church a direct and real authority over its chief administrative officers, the bishops, and over the real religion of its people. He and his successors created the universities which trained public servants and presided over an international court in which every sovereign in Europe was prepared to plead.

9. The Church and the Nations.—But the church, inherent in the social structure, also reacted to the national, social, and

cultural revolution of the 13th and 14th centuries. Frederick II (*q.v.*) was the first secular sovereign of the modern kind. He ignored without resenting the papal excommunication and was equally prepared to hand Germany over to the church (by the *privilegium in favorem principum ecclesiasticorum* of 1220), to make friends with the sultan (1229), and to crown himself king in Jerusalem, which he had sworn to protect. His greatest achievement, the Constitutions of Melfi (1231), drawn up in defiance of the pope, established an enlightened despotism in the Sicilian kingdom. His University of Naples, too, was a despotism governed by a royal chancellor.

France enjoyed peace and consolidation under Louis IX, who valued his throne as a means of making Christians. The military adventures of the English Edward III and Henry V, picturesque rather than political, served, as did the wars of Burgundy and Armagnac, to confirm the French nationality which Louis XI (1461–83) centralized in the throne. By the 14th century the vernaculars of Italy, France, Spain, Germany, and England were mature, their legal systems organized. They were aware of commercial rivalries and of national ambitions. Feudalism was dying. The Italian cities of Venice, Florence, and Milan were independent powers. The age of the Crusades was passing; that of national states had arrived.

The Holy See reflected this revolution. It became the centre of Italian politics and international diplomacy, subject to international intrigue. Its judicial business was extended. From increasingly secular states it demanded increasing revenues. Nicholas III was a political realist; he accepted the situation in which every cardinal was the agent of a political interest, and he exalted his own family, the Orsini. His successor, Martin IV, a Frenchman, was the creature of Charles of Anjou. Honorius IV (Savelli) raised his family against the Orsini. Nicholas IV (who relied on the Colonna) balanced the other two. Then the cardinals sought to remedy the corruption and forced a hermit, Peter of Morrone, unacquainted with the world, into the chair of Peter; Celestine V survived five months, was persuaded to abdicate, and died in prison. His incompetence was less disastrous than the ability and ambition of his successor. When Boniface VIII (Caetani), pursuing the logic of contemporary politics and Roman law to an extreme, forbade clergy to pay taxes to the secular government (*Clericis laicos*, 1296), Philip IV the Fair forbade the export of money from France. When Boniface claimed Scotland as a fief of the pope, Edward I annexed it to England. Both kings relied on their national assemblies, Edward I on the Parliament of Lincoln, Philip the Fair on the Estates-General. Finally French troops seized and imprisoned the pope, who died in 1303. (*See* further BONIFACE: *Boniface VIII.*) His successor, Benedict XI, denounced the outrage and died in a few weeks—of poison, it was said.

The next election took more than ten months, and the next pope, Clement V, archbishop of Bordeaux, transferred his court to Avignon in 1309. The "Babylonish captivity" had begun (*see* PAPACY: *The Papacy in Avignon*). Perhaps the most dramatic as it was the most shameful sign of the changed time was the suppression by Philip IV and Clement V of the Knights Templars, whose real offense was that with the decline of the Crusades they had taken to banking, a form of usury which evoked the resentment of their noble debtors and the greed of the king. The "Great Schism" which started in 1378 with the election of Robert of Geneva as Clement VII in opposition to the reigning Urban VI was the final tribute of the papacy to national rivalry. (*See* PAPACY: *The Great Schism, 1378–1417.*) Nations bargained with one side or the other.

The doctrine which accompanied, explained, and defended the new order was nominalism, which denied the reality of universals and declared it an "error to believe that there is something in reality besides the singular entity." (*See* NOMINALISM; OCKHAM, WILLIAM.) Thus there is no such thing as the nature of man which could be defined and must be obeyed and which might be united to the divine nature in the person of Christ; there were only individual men, and the definition of human right and duty was promulgated and enforced by the prince. Nature and supernature, reason and revelation thus parted company. Natural science, whether legal, empirical, or mathematical, could thus be rid of metaphysical assumptions and set free to handle facts and concepts each on its own terms. The prince was the source of rights and obligations and, in the words of John Wycliffe (*De officio regis*, 1379), was above human laws. The doctrine was expounded by those Franciscans who supported Louis the Bavarian in his claim to the empire as Louis IV. Marsilius of Padua and John of Jandun in the treatise *Defensor pacis* ("The Defender of Peace"; 1324) affirmed the authority of the civil power; the papacy was a human institution which had usurped temporal power (*see* MARSILIUS: *Defensor Pacis*).

Wycliffe's opinions, condemned in England, found a home at Prague and a more attractive apostle in John Huss (*q.v.*), whose preaching kindled the national imagination. Huss proclaimed the doctrine of Germany for the Germans, France for the French, Bohemia for the Bohemians. The Council of Constance which condemned him (he was burned at the stake in 1415) adopted the "nations" principle as the basis of voting and thereby defeated John XXIII's Italian majority. The conciliar movement (Pisa, 1409; Constance, 1414–18; Basel, 1431–37; *see* COUNCIL) represents an attempt to establish a parliament of Christendom or perhaps a league of nations. The decree *Frequens* of the Council of Constance declared that councils ought to be held every five years. At Basel the intention was even more explicit to make the pope the constitutional sovereign or nominal head of a Christendom whose national sovereigns were absolute.

The assembled doctors were not in a position to admit what was clear to the governments represented, that their authority was without foundation.

D. Reform and Definition

Meanwhile the humanism of the Renaissance (*q.v.*) and a wide and increasing practice of mysticism intensified individual religion and magnified the individual person. At length the revolution broke. It is symbolized in three events. In 1517 Martin Luther nailed his theses on the door of the church at Wittenberg. (*See* REFORMATION.) In 1534 the Act of Supremacy proclaimed Henry VIII supreme head on earth of the Church of England, which he described as "part of the body politic"; as a result of this, in 1535 John Fisher, Thomas More, and the London Carthusians were martyred. In 1543 was published the treatise *De revolutionibus orbium coelestium* of Nicolaus Copernicus.

All three events in their several kinds were acts of revolt and signs of exodus into the unknown from the given and created world which Christianity presupposed. "It is not necessary," said Copernicus, "that hypotheses should be true or even probable. It suffices that they lead to calculations which agree with observations." "By reformation," said Luther, "I do not mean the reform of this human teaching and spirituality; I mean its complete and absolute abrogation." "The true significance of the Copernican revolution consisted not so much in displacing the world's centre from the earth to the sun as in implicitly denying that the world has a centre at all" (R. G. Collingwood, *The Idea of Nature* [Oxford, 1945]).

In like manner the princes denied the organic unity of Christendom. The doctrine *Cujus regio, ejus religio*, "Let the religion of each state follow that of its prince" (first announced at the Diet of Speyer, 1526) was adopted throughout Germany by the Diet of Augsburg (1555) and then throughout Europe, Catholic and Protestant. In 1572 Catherine de Médicis answered the English protest against the St. Bartholomew massacre by proposing that Elizabeth I use the same method with Catholics. In 1593 Henry of Navarre "bought Paris with a Mass." The supreme artist in this secular statecraft was Cardinal Richelieu.

1. The Counter-Reformation.—Reform of the church began under Leo X, who came to the throne in 1513. In Italy the Theatines were founded (1524) to reform parochial clergy. About 1525 Matteo da Bascio founded the Capuchins, and in 1530 the Barnabites were founded by St. Anthony Zaccaria. Paul III began the Counter-Reformation by appointing reformers—Giampietro Carafa, Gasparo Contarini, Jacopo Sadoleto, Reginald Pole—to the sacred college. In 1536 they served with five others on a

commission which urged the need for reform and did not spare the abuses. In 1534 St. Ignatius of Loyola and six others initiated the Society of Jesus (*q.v.*). In 1542, by the bull *Licet initio*, Paul III established the papal Inquisition under Carafa's influence to supervise the whole church (*see* INQUISITION: *Roman Inquisition*). Pius IV and Pius V enlarged its powers, and Sixtus V reorganized it as one of the Roman congregations. In 1545 a general council met at Trent, which was postponed indefinitely in 1547. It reassembled (1551–52) under Julius III and met again, finally, in 1563. (*See* COUNCIL: *Councils of the Western Church: Council of Trent* [*1545–63*]; TRENT, COUNCIL OF.)

Trent was nothing that Constance had been, everything that Constance was not. Constance had seen the triumph of nationalism; Trent ignored it. Constance made no definition of the faith; Trent made nothing else. Constance had deposed the pope; Trent left everything in his hands. Convoked at the will of Paul III and interrupted by war, Trent made no pretense of gathering or expressing the will of Europe. It reformed the church and accepted the world. It recovered the centre which the movement and confusion of powers had displaced and obscured. Its answer to the theology of the Reformation was an affirmation of the divine-human unity: "In justification a person receives infused through Jesus Christ the remission of his sins, faith, hope and charity. For faith, unless there is added to it hope and charity, does not perfectly unite a person with Christ; nor does it make him a living member of His body; whence it is most truly said that faith without works is dead and unprofitable."

The works were not lacking. The Counter-Reformation inaugurated above all an age of sanctity: the cardinal archbishop of Milan, St. Charles Borromeo; the Florentine priest St. Philip Neri, whose Oratory founded in 1564 in Rome transformed the city; St. Francis of Sales, the most lovable of the doctors of the church, whose devout humanism and humane devotion influenced not only the Catholics of his century but Catholic and Protestant Christianity thereafter; St. Teresa of Ávila; St. John of the Cross, the greatest of the mystics; and St. Vincent de Paul.

2. Establishment of the Jesuits.—Nothing like the apostolate of the Jesuits had yet dawned on the Christian imagination. Within two years of the society's foundation, St. Francis Xavier under the patronage of John III of Portugal established a mission at Goa, on the west coast of India, and during his ten remaining years of life made thousands of converts in India, Malacca, Amboina, the Moluccas, and Ceylon; he founded a mission in Japan and was on the point of entering China when he died. At the same time Alfonso Salmerón was sent to Ireland with orders from Paul III "to be all things to all men, constant in good deeds, and to win souls by kindness."

In 1542 the Jesuits were established in Bavaria. They were invited to Salzburg, to Mainz, and to Osnabrück. Having carried the Counter-Reformation down the Danube and the Rhine, they were called to assist at Trent. They invaded Poland in 1570, England in 1580, Switzerland in 1586. In 1609 they took over the government of Paraguay and turned it into a perfect, almost too perfect, model of Christian social organization. In 1611 they arrived in Canada. Their Roman college, founded in 1551, was the mother of the greatest educational enterprise Christendom had ever known.

Placed under the direct command of the pope, the Jesuits were the natural foes of national autocracy. At Trent they supported a doctrine of episcopal jurisdiction which placed national bishops under the see of Rome, as against jurisdiction by divine right, which would have established their national independence. Hence they stood opposed to the Gallican ambition represented by the Paris Parliament, the university, and the Bourbons. Confessors of popes and princes, they were exponents of the "rights of man"; Juan de Mariana's treatise *De rege et regis institutione* ("On Kings and Royal Institution," 1599), dedicated to the future Philip III of Spain, lays its stress not on the legitimacy but on the justice of the king. It offended public opinion above all in France by defending tyrannicide. (*See* further JESUS, SOCIETY OF.)

3. National Independence.—The splendour of French culture in the 17th century was the fruit of Catholic humanism and national self-consciousness. Gallicanism was another consequence of the union of church and nation. The relations of the French church with the Holy See were defined by the concordat of 1516. The same principles of Gallican independence were affirmed in Bossuet's Four Articles (*see* BOSSUET, JACQUES BÉNIGNE) in 1682 and spread in the 18th century to the rest of Catholic Europe. The Jansenists, whose doctrines were condemned in 1713 by Clement XI in the bull *Unigenitus*, joined the Gallican cause against the Ultramontane influence of the Jesuits. In 1763, when the French Jesuits were being suppressed, Febronius (Johann Nikolaus von Hontheim; *q.v.*), auxiliary bishop of Trier and pupil of the Jansenist canonist Z. B. van Espen of Louvain, published his treatise *De statu ecclesiae et legitima potestate Romani Pontificis* maintaining the subordination of the pope to general councils and the independence of bishops. Condemned in 1764, the book circulated throughout Catholic Europe. In 1769 the ecclesiastical electors jointly protested against "papal usurpation." Joseph II, who became Holy Roman emperor on the death of Maria Theresa in 1780, carried out a Febronian policy in the Habsburg empire. In 1773 Clement XIV was forced by the governments of Portugal, France, Spain, and Naples to suppress the Society of Jesus. By 1793 the French monarchy was dead, the aristocracy abolished, and an egalitarian republic was preparing to establish the rights of man starting from the year I. The *Constitution civile du clergé* ("Civil Constitution of the Clergy"; 1790) was a Gallican measure (*see* FRANCE: *History: the Revolution and the Fall of the Monarchy* [*1789–92*]: *Civil Constitution of the Clergy*). The concordat of 1801 restored the terms of 1516.

See further GALLICANISM; ULTRAMONTANISM; JANSENISM.

E. THE CHURCH AFTER 1815

Napoleon passed like a storm and left Europe in ruins. Industrial revolution and economic determinism created a new absolute of natural necessity. The philosophers of reconstruction, idealist or utilitarian, were alike determinist (*see* DETERMINISM). J. G. Fichte deified the state; G. W. F. Hegel identified God with history; T. R. Malthus and David Ricardo regarded man as the slave of natural forces. Determinism was presupposed in theories of *laissez faire* and of the absolute state, materialism loudly proclaimed by the apostles of revolution and unconsciously generated by the preoccupations of scientific industry and efficiency. Such were the elements and climate of liberalism (*see* LIBERALISM).

1. The Catholic Revival.—The return of Pius VII from Fontainebleau, where he had been imprisoned by Napoleon, to Rome in 1814 was a triumph. Whole towns came out to do him honour; kneeling crowds lined the roads. It was a spontaneous gesture and expressed a piety deeper and older than the policies and theories which were transforming European government. In 1848, when Europe was in revolution, Pius IX at Gaeta was visited by a priest, Jean Baptiste Muard, who had begged his way from Subiaco whither he had walked a few months earlier from Pontigny, his purpose to ask the pope's approval (willingly bestowed) on the foundation of a religious house. Then he walked back to France, and in the forest near Sens, built a hut with chapel, kitchen, and dormitory where, with two companions, he lived in extreme poverty according to the Benedictine rule. Four years later he died. The community, which had become the mother of seven others in France, Palestine, and America, was driven from France in 1882, took over the ruins of Buckfast, Eng., and erected one of the most renowned of modern abbeys.

Muard was a child of peasants reared in poverty. So was John Bosco, whose work among the youth of Turin, begun in 1841, elicited the respect and won the support of the government, and who founded the Salesian order which was approved in 1874. So was Jean Baptiste Vianney, who became the *curé* of Ars in 1818, and so was Giuseppe Sarto, who became Pope Pius X. In the fall of the monarchies, the decay of aristocracies, and the advance of secularism among the intellectuals, the revival of the church sprang from the devotion, the family life, and the personal sanctity of the poor. Theirs was the mind which Pius IX, an indifferent politician and a great bishop, represented and understood. Poverty, chastity, and obedience, the ancient prescription for the Christian life, were also the condition of social vitality and the answer of

the Catholic people to the proletarian or capitalist theories of the secularist doctrinaires. They presuppose a universal humanity. But except as functions of a dismembered humanity, the politics and economics of power were meaningless, while for deity they substituted a religion of individual, national, and class emancipation and enlargement.

In 1848 this ancient adversary of the church appeared in Rome and demanded a liberal pope to lead a nationalist cause, Catholic Italy against Catholic Austria. The pope fled to Gaeta. The movement carried on these secularist assumptions mastered European politics, and the pope became the prisoner of the Vatican. In 1854 he defined the Immaculate Conception. Another statement of the same faith, sorely needed in the age of Nietzsche, appeared in the constitution *Dei Filius* (1870) of the first Vatican Council, which reaffirmed the principles of St. Thomas Aquinas on the relation between faith and reason (*see* VATICAN COUNCILS: *First Vatican Council: Decree "Dei Filius"*). At the moment of Bismarck's victory the pope defined the dogma of papal infallibility (*see* INFALLIBILITY). Together with the dogma of the Immaculate Conception and *Dei Filius,* it defined the structure of Catholic humanity against the drift and skepticism of progress and power condemned in the Syllabus of 1864. (*See* also PIUS: *Pius IX.*) Forty years later Pius X began his pontificate, "taking courage in Him who strengtheneth us to proclaim that we have no other aim but that of restoring all things in Christ, so that Christ may be all in all" (*E Supremi apostolatus,* 1903).

2. The War of Ideologies.—The word Ultramontane belongs to an age of territorial dominion. With the loss of the papal states it passed into history. The war of ideologies began. In 1872 Bismarck launched his *Kulturkampf* or "cultural struggle" (*see* GERMANY: *History: The German Empire, 1866–71 and 1871–1918: Bismarck's Liberal Period and the Kulturkampf;* BISMARCK, OTTO: *The Kulturkampf*). In 1873 the May Laws inaugurated a policy of nationalization. The Catholic Bureau in the Ministry of Education was abolished, schools placed under state inspectors and seminaries under state control, and, as the war proceeded, many of the bishops were imprisoned. The radical Rudolf Virchow invented the name *Kulturkampf* to mark the real conflict not between church and state but between two civilizations fundamentally opposed. Resisted not only by Catholics and the centre but by the court, the conservatives, and the Lutherans, the policy failed.

By 1887 the *Kulturkampf* was over in Germany. It was beginning in France. The Italian governments of left and right, unable to cope with economic distress, suffered continual disorder, and the forces of communism and socialism increased. Leo XIII, who succeeded Pius IX in 1878, issued a series of encyclicals on social and political questions which were accepted through the whole church as a classical statement of its principles.

(T. S. GY.; X.)

F. 20TH CENTURY

1. To World War I.—In France at the beginning of the 20th century the church was still experiencing a period of hostility between church and state, though Leo XIII had made overtures to the Third Republic in his ruling that Catholics (for the most part monarchists) should accept the Republican constitution. Anticlerical legislation, such as the suppression of most of the religious houses ("Expulsion of the Congregations") and the removal of schools from their care, culminated in the separation of church and state in 1905. Church property was declared to belong to the state, though its use for religious services was tolerated, and freedom of worship was allowed. An unexpected consequence of the separation was that the government could no longer veto nominations for the episcopate. The Dreyfus affair, which was finally concluded in 1906, showed the depth of the cleavage between Frenchmen, with the Catholics mostly in the conservative traditional camp (*see* DREYFUS, ALFRED; FRANCE: *History: The Third Republic to 1914: Dreyfus Case* [*1894–1906*] and *Church and Army*). Anticlericalism declined during World War I, when priests, called up for military service, demonstrated their courage and patriotism; the army had long been a traditional career for sons of many Catholic families, but their advancement before 1914 was very slow.

In Italy relations between church and state improved under Pius X, whose encyclical of 1905 permitted Catholics to vote in national elections. A controversy between the Spanish government and the Vatican, about the authorization of new religious orders, continued until 1912. The character of the government-nominated episcopate was repressive in Spanish Catholicism, and there was little intellectual life among the laity. In Portugal, after the unstable monarchy was ousted in 1911, the church was disestablished, the religious orders banished, and religion removed from the primary school curriculum.

2. Interwar Period.—*Russia.*—The new Communist government in Russia after the Revolution of 1917 worked against any religious influence. Its hostility came to a head in the trial of I. B. Cieplak, auxiliary bishop of Mogilev, and I. B. Budwiekicz, vicar general, both of whom were condemned on charges of plotting against the state. Budwiekicz was executed in 1923, but the bishop was later released. Catholics had always been a resented and suspected minority in this Orthodox country, and their numbers were still further reduced after Lithuania (1918) and eastern Poland (1921) had been detached from Russia.

France.—French Catholics were active in progressive political movements after World War I, though few were elected to the Chamber of Deputies. A vigorous Catholic intellectual life was inspired by Charles Péguy and Léon Bloy, whose works continued to be influential; by Jacques Maritain and Étienne Gilson, the expositors of Neo-Thomism; and by the novelists Georges Bernanos and François Mauriac. The *Action française* movement of Charles Maurras and Léon Daudet (*qq.v.*) was formally condemned by Pius XI in 1926 because it subordinated religion to politics and reduced Catholicism to a useful adjunct in the armoury of national solidarity. During the Spanish Civil War (1936–39), French Monarchists and conservative Catholics instinctively sided with the Spanish Nationalists, while the Catholics of the left, in competition with the Communists for the support of the French proletariat, were unhappy about the alignment, some even supporting the Republican government.

Germany and Austria.—In Germany, under the liberal constitution of the Weimar Republic (which rested on a coalition that included the Centre, Catholic, Party), Catholicism flourished, with a wide range of newspapers and publications; so did the Communist and the National Socialist movements. Indeed, in Bavaria the National Socialists (Nazis) went largely unchecked because the Bavarian government, dominated by the Catholic Bavarian People's Party, was opposed to the Weimar government. Catholicism, however, was not of first importance in politics, though a Catholic, Heinrich Brüning, was chancellor of the republic in 1930–32, just before Hitler came to power, and the votes of Centre Party deputies in the *Reichstag* helped to give him full powers in March 1933. In that year (1933) the Vatican signed a concordat with Hitler which seemed to promise the church all the essentials of independence, even in matters of education. But Hitler merely wanted the Catholics quiescent until his government was secure. The concordat did not save the church from Nazi interference, and by early 1937 Pope Pius XI's encyclical *Mit brennender Sorge* ("With Burning Anxiety") detailed the ways in which the concordat had not been kept. (*See* also PIUS.) Meanwhile various German bishops had condemned Nazi racial ideas and forbidden Catholics to join the Nazi Party. The prohibition was not closely observed, many Catholics regarding it as an unwarrantable intrusion by the church authorities into political life and preferring the Nazis to the Communists.

In 1938 Hitler took over Austria, where after the dismemberment of the Austro-Hungarian Empire at the end of World War I the Christian Socialist Party (relying on the Catholic peasants) had been in the majority. After the four-day civil war in 1934, the Catholic prime minister Engelbert Dollfuss transformed the parliamentary constitution into an authoritarian, one-party ("Patriotic Front") government influenced in its social framework by the encyclical *Quadragesimo anno* (1931), and a concordat was signed with the Vatican. Under this new regime the Nazis con-

tinued to infiltrate until the *Anschluss* in 1938, after which Austrian Catholics were faced with difficulties similar to those troubling German Catholics.

When World War II began in 1939, German Catholics, supported by the hierarchy, hastened to demonstrate their patriotism. And as the war began to go badly for Germany it became increasingly difficult for them to express any criticism. Although some individuals resisted Hitler's racial atrocities, no very explicit condemnation of them came either from the hierarchy or from Pius XII, who decided against placing German Catholics in the position of traitors to their country.

Italy.—Mussolini, after he came to power in 1922, began conversations with the newly elected Pius XI, from which issued the Lateran Treaty and the concordat of 1929. By the former the political neutrality of the papacy was assured, and by the latter the church was established in Italy. The pope at long last acquiesced in the seizure of Rome and the papal states in return for the acknowledgment of his sovereignty over the small area of the newly created Vatican City State within Rome and for payment in compensation for the property seized. Church and state were soon at loggerheads over education, which Mussolini claimed as the prerogative of the state. In 1931 the encyclical *Non abbiamo bisogno* protested against the educational pretensions of Fascism.

On the whole, however, the new relationship between church and state found widespread acceptance at first, because it ended the anticlerical feeling the parliamentary regime had fostered. Mussolini's invasion of Ethiopia led to a rallying of patriotic sentiment in which the Italian clergy, including a number of bishops, took part. The regime and the Vatican were also drawn together when the Italian government sent help to the Nationalists in the Spanish Civil War. But relations rapidly deteriorated after Mussolini concluded the Axis pact with Germany, and Pius XI was on the verge of a denunciation when he died early in 1939. In spite of efforts by Pius XII to keep Italy neutral, Mussolini declared war on France and Great Britain in June 1940. Thereafter the Vatican remained neutral, as the terms of the Lateran Treaty continued to operate, and much humanitarian work was done there for war victims, including Jews.

Spain.—The fall of the Spanish monarchy was followed by the violent anticlericalism of the Second Republic (1931–36). The Jesuits were expelled, religious schools were ordered to close, many churches were burned, and Pedro Cardinal Segura y Sáenz, archbishop of Toledo and primate of Spain, was expelled from the country. The Catholics organized a broadly based Christian Democratic Party (CEDA), led by José Gil Robles, which won the elections of 1933 but was unable to control the situation. In 1936 the Popular Front won a substantial majority, chaos increased, and the civil war (1936–39) broke out within a few months. The Catholics led by the hierarchy were on the Nationalist side, although theirs was an uneasy partnership with the Falangists; on the other hand, the Basque nationalists, Catholic and separatist, supported the republic to the end. More than 7,000 priests and religious were murdered, mostly by anarchists, in the Republican zone.

Portugal.—An army *coup* of 1926 followed the reelection of the left-wing government in 1925. By 1928 a Catholic professor of economics, António de Oliveira Salazar, was in virtual control and remained so. With the church his relations were defined by the concordat of 1940, which separated church and state.

Ireland.—In Ireland the tension between Catholic and Protestant had outlived emancipation, being exacerbated by the political conflict over home rule between the mainly Catholic Nationalists and the Unionists of Ulster, nearly all of whom were Protestant. The peace settlement of 1921 divided the island into two parts, one with a Protestant, one with a Catholic minority. Sporadic violence by the Irish Republican Army was condemned by the hierarchy, but as the Irish republican government disowned such actions the condemnation caused no conflict, and church-state relations were and continued to be so harmonious as to render a concordat unnecessary.

The interreligious strife of Ireland adversely affected Catholic-Protestant relations in Britain in areas of massive Irish immigration, such as Liverpool and Glasgow. Though the proportion of Catholics in Britain of Irish descent was very high, the most conspicuous Catholic figures were often converts, as G. K. Chesterton, R. A. Knox, and Eric Gill. Politically there were no more battles for the church as a whole in Britain, only for individuals.

3. After World War II.—After the end of World War II the church in Europe was faced with the Communist threat and with the increasingly secular and materialist attitude that permeated society.

Eastern Europe.—In those countries of Eastern Europe where Communist governments were in power, the church was subjected to interference in its normal activities and to imprisonment, deportation, or execution of some of its leading clergy and members of religious orders. In the Soviet Union the Catholic Byzantine rite churches were abolished entirely, their members being given the choice of joining either the Latin rite Catholics or the appropriate Orthodox Eastern Church.

In Yugoslavia Archbishop (later Cardinal) Alojzije Stepinac was imprisoned (1946) on charges of forcibly converting Orthodox Serbs to Roman Catholicism and collaborating with the Germans during World War II; in Czechoslovakia Archbishop (later Cardinal) Josef Beran was confined for his protests against state interference with church affairs; and in Hungary József Cardinal Mindszenty was imprisoned in 1949 on a charge of treason. As communications worsened between the West and the Communist countries of Eastern Europe, some bishops in the latter found it advisable to sign national agreements with their governments, against the advice of the Vatican. The clergy were under constant pressure to support the government without question.

Catholics are in the majority in Poland, where, since the country was for so long under Russian Orthodox or Prussian Lutheran rule, there is a strong national feeling in favour of the church. After emerging from Nazi persecution the Polish church after World War II was much discriminated against by the Communist authorities, who used the weapon of excessive taxation of colleges and seminaries. The bishops under Archbishop Stefan Wyszynski of Gniezno and Warsaw, who himself suffered imprisonment, did not submit in silence, but by tenacious protests managed to obtain some alleviation in 1950, when a *modus vivendi* between church and state was agreed on. After further troubles a new agreement was reached in 1956, and Wyszynski was permitted to go to Rome to receive the red hat in 1957 (he had been elevated to cardinal in 1953).

In the later 1950s there was some relaxation of pressure in Communist Europe. Concessions were made in certain publicized areas, though concurrently legislation was often introduced that obstructed the practice of religion without being obviously directed against the church. Many bishops from behind the "iron curtain," including those from the German Democratic Republic, were permitted to attend the second Vatican Council in the 1960s.

Western Europe.—After World War II Catholics in France founded the Mouvement Républicain Populaire, parallel to the Christian Democratic Party in other countries. Never strong enough to form a government, it joined coalitions with other parties, generally the Socialists. French Catholics, notably Robert Schuman, were prominent in the United Europe Movement, which was supported by the Catholic political parties in the six countries forming the European Economic Community.

A new departure in France, begun toward the end of the war, was the worker-priest movement, whereby, in an attempt to bring the church to the secularized industrial population, certain priests went to work full-time in secular posts and share the lives of working people. Unfortunately some of the worker-priests so closely identified themselves with their lay colleagues that they joined in a Communist demonstration in Paris in 1952. This led to stricter control and then to discontinuation of the worker-priest movement. There was much discontent in France among a great many Catholics who did not agree with this decision. In 1957 the *Mission ouvrière* ("Working Mission") was founded, to consist of priests and lay workers. The question of worker-priests was raised again under Pope John XXIII, who had had personal

knowledge of French affairs. In October 1965 it was announced that, by agreement with the Holy See, the French bishops had authorized resumption of the movement.

The division of Germany left Catholics only slightly less numerous than Protestants in the Federal Republic of Germany, and both joined to form the Christian Democratic Party which governed the country when self-rule was achieved after World War II. The realization that the anti-Christian Nazi government had come to power so easily partly because Christian opposition to it had been divided led Catholics and Protestants to work together in the social and political sphere. German Catholics, including priests and theologians, were anxious for reform within the church which would make it easier to heal the breach with the Lutherans. German bishops and consultors thus became the leading exponents of change at the second Vatican Council, endeavouring to stress their common heritage with the Lutherans especially by using German instead of Latin, by presenting the Mass in terms of Holy Communion and the altar as the Lord's table, and above all by emphasizing the preeminent place of Scripture.

In postwar Austria the majority party was again Catholic, now called the Austrian People's Party instead of Christian Socialists. After the occupation of the country came to an end in 1955, Austria passed a law of perpetual neutrality. In 1957 the question of a new concordat was raised, but in the following year the Vatican decided that the 1934 concordat should stand.

In Italy the strongest political party after the war was the Christian Democratic, the successor of the short-lived Popular Party formed just after World War I by the priest Luigi Sturzo. Its outstanding statesman, Alcide De Gasperi, was prime minister during 1945–53. His party was unified in its opposition to Communism. The Communists had been strengthened by their activities in the resistance movement during the war, and the Italian Communist Party was the largest in Western Europe. The church had interposed the Italian Catholic Action as a lay activity between the Holy See and the Christian Democrat Party, and there were many occasions when the government acted in a way neither approved nor understood by the Vatican, as for instance in the latitude allowed to the Communists to attack the church. Communists in Italy, for tactical reasons, maintained that they were not opposed to the religion of the people but concerned only with their material betterment.

Catholic Action in 1959 was made dependent on the bishops instead of directly on the Holy See and began to be less concerned with anti-Communism, though the ban on Catholic cooperation with Communists continued. This caused friction especially in Sicily, where coalition of the Social Democrats with leftist elements was censured by the church. In 1963 there was some increase in the Communist Party's role after the publication of the encyclical *Pacem in terris,* though there was no relaxation of the Catholic ban on cooperation with Communists.

In Spain a new concordat was made (1953) by which Catholicism remained the established church of the country. The previous right of the Spanish crown to choose the bishops was modified in favour of an arrangement whereby the papal nuncio in consultation with the government was to submit six names to the pope who would return three of them, one of which was to be accepted by the head of state. Freedom of worship was guaranteed to all, though the small Protestant minority had to worship in buildings which did not resemble churches from the outside. This and other limitations on their freedom of action, such as the prohibition of Protestant processions and of the distribution of Protestant publications, were justified by the government on grounds of public order. Following the papacy of John XXIII, however, conditions for the Protestant minority improved.

Many members of the Spanish government belong to Opus Dei, a "secular institute" whose members live in the world, practising their professions but handing over most of their earnings to Opus Dei. The influence of Opus Dei members (to be found outside Spain as well) in Spanish public life has been variously estimated; it probably was less than the wholesale infiltration attributed to it by some nonmembers.

The impression sometimes given to outsiders of the monolithic solidarity of the church behind Salazar and Franco was altered by reports in the 1960s of arrest and deportation of priests for supporting the rebels in Angola, of episcopal and lay support for miners on illegal strike in Asturias, and of the protest of the abbot of Montserrat against the general lack of freedom, especially the Castilian overshadowing of Catalan culture; on this last point, it was notable that provision was made in the vernacular liturgy for the use of Catalan, Basque, and Galician in appropriate areas.

During the 20th century the number of Catholics in Great Britain increased steadily, chiefly by immigration from Ireland. The great preoccupation of church authorities in England and Wales continued to be educational. Although the government pays the salaries and running costs, Catholics must provide one-quarter of the initial costs of all new schools. Catholics share in the expansion of university education in Great Britain. During World War II and after the pontificate of Pope John XXIII a new spirit of ecumenism led to closer and better relations with other Christian bodies. In 1964 some of the long-standing prohibitions, which had become ingrained habits since penal times, against attending or taking part in Protestant services were lifted at the discretion of the hierarchy. After the disappearance of the Irish Nationalist members of Parliament, Catholics seldom had more than 25 members, with slight preponderance on the Labour side. But they became more prominent in local government and in the trade-union movement, in which they played a leading part in combating Communist influence.

III. THE CHURCH IN THE AMERICAS, AFRICA, AND THE ORIENT

A. SPANISH AMERICA

Colonial Spanish America showed a curious intermingling of the spiritual and the political, and as a result it is difficult to mark the limits of the activity and influence of the church. In Spain the church had been a unifying factor in the development of national life. In Spanish America it had an even greater influence because after the accession of Queen Isabella I (1474) the crown, preoccupied with consolidating its power in Spain, was unable to assume the cultural and educational responsibilities which the New World presented. With royal consent and encouragement, the church assumed those responsibilities.

1. The Spanish State and the Church.—Relations between the state and church were governed by royal patronage, a long-standing custom in Europe extended to the New World (*patronato real indiano,* "royal patronage of the Indies") by a series of papal bulls. In 1493 Pope Alexander VI granted Queen Isabella title to the new lands on condition that the crown christianize the Indies. To aid in this work he transferred to the crown jurisdiction in the ecclesiastical government of the Indies. In 1501 the crown of Castile was granted the right to collect and administer all church taxes in the Indies on condition that it defray all church expenses. In 1508 Pope Julius II issued the bull *Universalis ecclesiae,* which listed the royal rights and prerogatives in detail. (*See* also LATIN AMERICA: *The Colonial Period.*) Papal attempts to curb or revoke the *patronato real indiano* were unsuccessful during the colonial period. Its main features were:

a. Control of church offices. For the higher church offices, such as bishoprics, the king nominated a candidate who was generally confirmed in office by the pope. When Rome rejected the nomination, the king usually submitted another name without delay; if he did not, the see remained vacant and its rents flowed into the royal treasury. Lower ecclesiastical offices (cathedral canon, parish priest, and even at times the sacristan) were ordinarily filled by the local royal representative from a list of three names presented by the bishop concerned.

b. Control of church personnel. This meant that no clergyman could go to or return from the Americas, even on official business, without royal permission. Bishops could not travel outside their dioceses without express permission of the crown, nor

could they resign without prior royal consent. The crown determined which religious orders could found convents in America —Franciscans, Dominicans, Mercedarians, and Augustinians, in that order—and which of their members could be sent there. When the Mercedarians aroused royal dissatisfaction by their support of rebellious movements in Central America and Peru, Philip II ordered their suppression, and the Jesuits were named in their place; Jesuits went to Peru in 1567 and to Mexico in 1572.

c. Control of church communications. More serious than the control over church personnel was that exercised over church communications. In 1538 Charles I ordered that thereafter no communication, except of conscience matters, could pass between the pope and church officials in the Spanish Indies without the approval (*pase*) of the Council of the Indies. The royal apologist Antonio Joaquín Rivadeneira maintains that only six papal bulls were denied the *pase* in two centuries. However, many more papal documents, though not bulls, were refused admittance to the colonies.

d. Control of church finances. Finally, the crown accepted financial responsibility for the church in the Indies on condition that it collect and administer church taxes. This ensured almost complete control; obviously any church effort that had to rely on royal funds was subject to the royal will. The royal treasury was not equal to the task it had assumed. Gradually the religious orders and bishops began to accept bequests and other forms of wealth as supplementary income. The growing affluence of the church brought the reduction or elimination of royal contributions. Then the crown began to look for ways to divert church monies into the royal treasury. One way was the levy (*donativo*). Theoretically this was a voluntary gift, but the crown usually determined how much it would be pleased to accept. Thus, in California, Junípero Serra in 1783 paid more than 100 pesos as the donation of Carmel Mission to the crown for prosecution of the Spanish war against the English. After 1617 the king reserved almost a third of the tithes for the royal treasury instead of using them all for church purposes. In 1798 a tax of 15% was placed on ecclesiastical property. In 1804 most of the capital of the pious foundations of Mexico, 10,656,000 pesos, was gathered into the royal treasury. Thus, by the end of the colonial period the church was contributing more to the crown than the crown was contributing to the church. However, the crown continued to support, as best it could, the vast mission enterprise on the same basis as at the beginning of colonization. (*See* also INDIES, LAWS OF THE.)

2. Early History.—The church arrived in the Americas on the second voyage of Columbus, in the persons of Bernardo Buil, vicar apostolic, and several Franciscans, sent primarily to minister to the Spaniards rather than as missionaries. Stress on the conversion of the natives eventually brought a division of labour; the religious orders concentrated on work among the Indians, while the diocesan clergy for a long time ministered chiefly to the Spaniards.

Earlier estimates of the native population in America in the 16th century place the total under Spanish jurisdiction at about 15,000,000, but more recent studies seem to indicate 30,000,000 as more nearly accurate. The eloquence of the chroniclers of the conquest tends to persuade the reader that the majority of those Indians lived in Aztec and Inca cities of relative splendour and magnificence, so that all the Spanish clergy had to do was transform the pagan temples into churches and begin the work of conversion. This is not true. Many, perhaps most, Indians were more or less nomads. Even the sedentary inhabitants of the great empires lived for the most part in crude huts scattered amid the arroyos and *quebradas* near their fields. This dispersion of the Indians was a very real obstacle to the work of conversion. The relative success of some experimental Indian settlements (or reductions) in Hispaniola and Cuba caused the adoption, after the conquest of Mexico in 1521, of the policy of settling Indians into pueblos of at least 400 families. With the sedentary tribes this was not difficult, but with the nomads, who knew nothing of community living, the friar had to instruct in selecting a town site, laying out streets, erecting houses and community buildings, bringing in water, electing town officials, and planting and cultivating crops.

The friars were never more than a handful among the millions of Indians, and it was impossible even to think of individual instruction. A solution was found in the protracted catechumenate, a system that permitted baptism of the Indian after he had been instructed in the essential articles of the faith, on condition that the instruction be perfected by enforced attendance at doctrinal classes several times a week until the neophyte was completely instructed.

In the first decades the friars were aided in their work by laymen, called *encomenderos*, who, in exchange for a share of the Indian tribute, were to care for the technical and cultural instruction of their wards and to defend the priests against violence. Priests working among the Indians were called *doctrineros* and the cooperative system was known as the *encomienda-doctrina*. By 1574 this agency had founded some 9,000 Indian pueblos with a total population of about 6,000,000. Each pueblo had its church or chapel; a large proportion also had schools for the instruction of the sons of the principal families; many had hospitals which served also as hospices for travelers. Admission to these institutions was free, since the charges were already included in each Indian's tax. (*See* also MEXICO: *History: Colonial Period;* NEW LAWS.)

In 1573 Philip II forbade the expansion of the *encomienda*, and a new system had to be developed for the assimilation of the Indian into colonial society. This came to be known in Spanish as *la misión*, a term unknown in Spanish law before 1573. In the mission the Indian was to be kept in involuntary isolation from Europeans under the direct care of a priest and the protection of mercenary soldiers. Some of the older religious orders, notably the Augustinians and Dominicans, unable to adapt themselves to the new system, gradually dropped out of frontier Indian work. The Franciscans, after a period of hesitation, adopted it. The Jesuits, recently arrived in Spanish America, took to it enthusiastically and in the 17th century founded many flourishing missions, the most famous the Paraguayan reductions (*reducciones; see* PARAGUAY: *History*).

3. Social and Intellectual Developments.—There were by-products of the major effort of the church to convert the Indians. Native languages were mastered. The customs and culture of the peoples were recorded by Bernardino de Sahagún, Antonio de la Calancha, Motolinia (Toribio de Benavente), Diego Durán. Missionaries were explorers, geographers, and cartographers as well. The Franciscan Juan de Zumárraga arranged for a press in Mexico in 1539 primarily to print books for the instruction of the Indians. By 1810 printing establishments were found in 25 Spanish-American cities. Special schools were begun for the Indians, some technical, as the Colegio de San José of Pedro de Gante in Mexico City or that of Quiroga at Pátzcuaro, others true senior colleges intended for the training of Indian leaders, as that of Santa Cruz of Tlaltelolco (1536) or San Andrés in Quito (1554).

In the 16th century church schools also offered the only elementary education to the young European or creole (Spaniard born in America). By the 17th century this burden was shared by the city councils, but secondary education remained a near monopoly of the church throughout the colonial period. This was especially true after the arrival of the Jesuits, who found the creoles almost abandoned by the older orders in favour of the Indians. Even before the Jesuits came, the church had begun a series of universities: Santo Domingo (1538), Lima, and Mexico (1553). There were 25 universities and 56 colleges at the end of the colonial period.

4. Spaniard and Spanish American.—Spain gave to America some of her noblest men: St. Alfonso Toribio of Lima, St. Francisco Solano of Argentina and Peru, St. Peter Claver of Cartagena, St. Luis Beltrán of Colombia. The gift found a worthy response among the peoples of America: St. Philip of Jesus (mestizo), St. Rose of Lima (creole), St. Anna Paredes of Quito (creole), and St. Martín de Porres (mulatto). In view of this response it is difficult to understand the refusal of the Spanish clergy to share freely not only the leadership of the church but even the priesthood

itself with Spanish Americans. By the end of the colonial period there were ten archbishoprics and 38 bishoprics in Spanish America. Of the 171 bishops and archbishops of New Spain (Mexico), 130 were Spaniards, 32 were Mexicans, and 9 others were from other Spanish-American areas. Only one archbishop of Mexico had been born in that country. Of the 535 bishops and archbishops in the rest of Spanish America, a mere 64 were American-born. Only one archbishop of Lima was a Spanish American, Fernando Arias de Ugarte, native of what is now Colombia.

More serious was the denial of the priesthood to persons of Indian or Negro blood. Since a large proportion of the people of Spanish America were of either Indian or Negro parentage, this law automatically prevented development of one bond between the people and the church and removed an incentive to better their religious understanding and practice. It also placed a strain upon the relatively few in the population who were eligible for the priesthood. Fortunately this law was frequently no better observed than were numerous other royal decrees, and there were in fact many mestizo and Indian priests. But the prohibition remained, and since Spanish America never supplied the number of priests it needed the deficit had to be made up from Spain. About 11,000 priests and friars left Spain for the Americas and the Philippines during the 17th century; the number was only slightly smaller in the 18th century. Such departures created enormous problems in Spain, where no bishop and no provincial was willing to lose a good priest, and perhaps even greater problems of adjustment in the Americas.

The predominance of Spaniards among the bishops and the large proportion of Spanish priests and friars, many in preferred positions, did not help to identify the church with its people. Despite this, in the independence movements all of the colonies except Cuba and Puerto Rico received help from clergymen. Miguel Hidalgo and José Morelos are famous Mexican patriot-priests. Sixteen of the 29 who signed the declaration of independence for Argentina in 1816 were clergymen. In Peru, of the 51 members of the constituent assembly of 1822, 26 were priests and the president was Francisco Javier Luna Pizarro, later archbishop of Lima. How significant these examples were among the clergy at large is not clear, since few studies exist of priests who opposed independence. Such studies have been made for the bishops, and these reveal that the prelates were about equally divided for and against independence.

5. 19th Century.—After the achievement of independence, a readjustment had to be made in the balance of power between the new states and the church. In most of these countries the church occupied a position of suffocating superiority in organization, security of tenure, and trained and loyal personnel. The state was often merely a name, with no fixed limits, no national consciousness, few resources, and few trained administrators. In many areas the readjustment was hostile.

Some ill feeling arose from the traditional friendship of Rome with the Spanish monarchy. In accord with this policy, Pius VII solemnly condemned the Spanish-American patriots as rebels in 1816, and Leo XII in 1824, at the request of the Spanish crown, renewed the condemnation. Repeated friendly overtures by Simón Bolívar and by the governments of Argentina, Chile, and Mexico were rebuffed. More serious was the harm done to the church by the lack of influence of the Holy See at a time when the anarchy of the war years had occasioned numerous abuses and alert leadership was required to set them right. Governmental policies were being formed in areas of vital concern to the church, and it was imperative that vigorous church leaders share in their formation. Yet many sees, some the most important in the Americas, were vacant through death, exile, or desertion. Archbishop Pedro Ponte of Mexico City abandoned his people and returned to Madrid in 1822, whence he issued excommunications until his death in 1839. Independent Mexico did not get its first archbishop till 1840, by which time the trend of national development had been quite clearly determined. For many years Rome could not even fill vacant sees, since it did not recognize the new governments. In 1829 there was only one bishop (of Arequipa, in Peru) along the entire western coast of South America. This stagnation of church leadership offered an opportunity to those who wished to organize public life on a secular basis, and the spiritual resources inherited from the colonial church were in large measure frittered away.

6. 20th Century.—The political life of the Spanish-American republics in the 19th century is thus largely the story of the struggle between church and state. (*See* also LATIN AMERICA: *Era of Material Progress, 1850–1914: Catholicism and Anticlericalism;* ANTICLERICALISM: *Central and South America.*) It was marked by unyielding stubbornness on both sides. The main concern was not doctrine but power: right of patronage, control of church property, education, and, in some instances, marriage. Both sides concentrated on this contest to the neglect of other pressing needs. The nations have not followed a uniform pattern in resolving the struggle. Some, such as Mexico, have retained a punitive attitude. A number of countries have chosen complete separation of church and state. In others the ancient rights of patronage, inherited from the Spanish kings, still apply in some degree. In all countries of Spanish America there is now religious toleration.

Within this framework the church in the 20th century has regrouped its forces to carry on its spiritual mission. The task is formidable, for, although 93% of the people, around 192,000,000 (including Brazil), profess to be Catholics, only about one-eighth actually practise their religion. About 70% of professing Catholics lack basic religious instruction and retain only a folk Catholicism handed down within the family. A great many are also illiterate and poor. Basic to the work of the church, therefore, is education at all levels and social welfare in its broadest concepts. The problems vary so widely from country to country that it is not possible to describe them and the church's responses to them in detail. They vary from the radio schools of Monsignor José Salcedo, which have 500,000 pupils in Colombia, to the Christ schools of the Franciscans in Bolivia, which encourage the Indians to place windows in their adobe huts and to clean the floors. The Catholic University of Chile maintains one of the best medical schools in South America; the auxiliary bishop of Bogotá helps his people purchase cows. In all the countries of Spanish America the church is interested in informing the people, rich and poor, of their social and political rights and duties and is anxious to implement these teachings through trade unions, cooperatives, and the like.

In the 1960s the Roman Catholic Church had nearly 500 ecclesiastical jurisdictions in Latin America (figures include Brazil), including 85 archdioceses and nearly 300 dioceses. The shortage of priests continued to be critical—there were fewer than 39,000, or roughly one priest for each 4,750 faithful. A great many of these were sent from other countries, including about 2,750 missionaries from the United States. About 18,000 priests and religious were from Spain. Religious—more than 27,000 men and nearly 100,000 women—conduct most of the missions in the hinterland and carry on teaching and charitable works. In 1961 the United States bishops, in response to a papal request, set up the program of Papal Volunteers for Latin America (PAVLA), training and sending lay missionaries to Latin-American countries.

To make the church effort more effective, CELAM (Consejo Episcopal Latino Americano, or Latin-American Bishops' Council) was set up in 1956, with headquarters at Bogotá, as a clearing house and coordinator of services and information. In 1959 the first Inter-American Episcopal Conference, attended by 23 prelates of Canada, the United States, and Latin America, was held in Washington, D.C. The problems that face the church today in Latin America are greater and more complex than those it faced at the time of the conquest. It now has the organization to meet them on a continental basis. *See* also LATIN AMERICA: *The Post-war Years: The Roman Catholic Church.*

B. BRAZIL

1. Early History.—En route to India, Pedro Álvares Cabral landed in Brazil in 1500 and claimed the land for his king. The superior of the 16 Franciscan missionaries aboard, Father Henry of Coimbra, celebrated Mass near Bahia (Salvador) on April 26,

1500, the date Brazilians regard as marking the foundation of the church in their country.

Portugal was concentrating its men and resources on the trade with India, then only recently opened by Vasco da Gama, and for a long time Brazil had to take second place in church as well as state affairs. Relations between church and state in Portugal and Portuguese America were similar to those in Spain and Spanish America. Through papal grant (the *padroado*) the king was in fact the head of the church. As a result, if royal interest in Brazil lagged, church interests were not vigorously pressed.

During the decades after the initial contact some Portuguese diocesan priests and small groups of Franciscans arrived in Brazil, but their influence was negligible. More important was the arrival in 1549, with the first royal governor general, of a group of Jesuits under Manuel da Nóbrega. They opened the first schools in the cities and, especially after the arrival of José de Anchieta in 1553, began their work among the Indians. In 1557 the Jesuits began their first Indian *aldeia*, a settlement similar to the Spanish mission. (*See* also BRAZIL: *History: Early Period: Royal Control.*)

The first bishop was appointed in 1551, with his see at Bahia. That see became an archbishopric in 1667, with suffragan sees in Rio de Janeiro and Olinda. By the end of the colonial period there were also bishops in São Luis, Belem, and São Paulo.

2. Religious Orders.—The Jesuits were the most influential force in early Brazil. However, Franciscans established elementary schools in the cities and worked among the Indians, especially in the north. The Benedictines arrived in 1584 and exerted a strong influence on culture, especially in the south, through their schools; by the end of the colonial period they had 30 foundations. The Carmelites arrived in 1589.

In general the Jesuits held almost a monopoly of work with Indians in the south. In the north in 1750 there were about 60,000 Indians in 63 *aldeias*, of which 19 were administered by the Jesuits, 15 by the Carmelites, 26 by the Franciscans, and 3 by the Mercedarians. The French scientist C. M. de La Condamine, who visited some of them in 1743, was startled by their prosperity. This work among the Indians was the glory of the church in Brazil. Little is known of any organized effort among the great number of Negro slaves. Nor did the church found any university or similar institution of higher learning in colonial Brazil.

In 1759 the marquês de Pombal, the Portuguese prime minister, expelled the Jesuits from Portugal and its possessions. In Brazil they then had 9 *colegios*, 5 seminaries, 36 missions, 25 residences, and 5 other houses. Certainly work among the Indians suffered substantially from the expulsion, but more serious for the church was the effect on the seminaries, to the faculties of which Pombal appointed professors of his own liking. Henceforth the clergy were to be more obedient to the state than to the church.

3. 19th Century.—Brazil became independent without any severe struggle in 1822 when the son of the Portuguese king declared for independence and became the emperor Pedro I. During his reign and that of his son, Pedro II, the Brazilian clergy adopted the liberalism introduced by the Portuguese court, some of them even joining the Masonic lodges, centres of liberal culture and humanitarianism, though the Holy See had repeatedly forbidden such participation. The Brazilian church was drifting toward not merely tolerance but religious indifference. The break came in 1872 when the bishop of Rio de Janeiro suspended a priest who refused to give up his Masonic affiliations. The bishops of Belem and Olinda, in sympathy, issued an interdict against those religious lay brotherhoods (*irmandades*) which refused to expel members who were Masons. Pedro II declared the interdict invalid and without effect, and the bishops, refusing to yield, were imprisoned as rebels. The attendant controversy separated the secularist elements from those who desired a strong spiritual leadership of the church. In the separation the church lost heavily. After the establishment of the republic in 1889, the new government disestablished the church, and though the bishops protested the action, the general public was apathetic.

4. 20th Century.—Since about 1920 there has been a marked increase in the vigour of the church and in its influence in many areas, though it is still not strong. The intellectual movement begun by the eminent essayist Jackson de Figueiredo Martins and continued by Alceu Amoroso Lima deepened with time. The church built schools, four of them universities, so that by the 1960s there were 3,500 with more than 600,000 students. The church maintains nearly 1,400 centres for social welfare. The labour movement is strongly dominated by alien traditions, but the young workers of Catholic Action are gaining experience in it. Success in the labour movement, however, will depend to a great extent on the outcome of parallel movements to rechristianize home and political life. In this effort the church meets opposition from two characteristically Brazilian movements: sophisticated Spiritism and the Legion of Good Will, a movement founded on vague humanitarian notions and religious indifference.

Despite the numerous setbacks suffered by the church in Brazil, more than 50,000,000 Brazilians declared themselves Catholic in the census of 1950, and by the mid-1960s Catholics numbered an estimated 60,000,000, served by 10,000 priests. (A. S. TR.)

C. North America

1. Early Missions to the Indians.—In colonial North America the church of Spain launched the first and not the smallest missionary effort: priests accompanied the Spanish conquistadors who first explored parts of the present United States. After several early attempts at evangelization had ended in bloody failure, the church, with the foundation of St. Augustine in Florida in 1565, began its continuing presence. In subsequent years Franciscan friars laboured among the Indians of present-day Florida, Georgia, and Alabama, an area that eventually contained 26,000 Catholic aborigines, served by 35 mission stations. This work, carried on for a century and a half, ended when the English and their Indian allies destroyed the mission during Queen Anne's War (the American aspect of the general European War of the Spanish Succession).

Far to the west, other Spanish ventures proved more lasting. In 1598 Franciscans began the evangelization of New Mexico, and by 1630 they were ministering to 30,000 Indian converts. Jesuits began the evangelization of Arizona in 1691. In 1769 Franciscans moved into California and created a series of 21 missions along the coast; by 1820 they had reported the baptism of over 50,000 aborigines (*see* CALIFORNIA: *History: Missions*). By the time the United States seized these lands in the Mexican War, the missions and the Indians were dying out, but a remnant survived to become part of the American church.

With the establishment of Quebec in 1608 the church began its existence under the flag of France. Priests accompanied the pioneers and started missions among the Indians of Acadia (Nova Scotia) and the St. Lawrence Valley. Jesuits set up stations among the Hurons on the Great Lakes. The first North American saints were the Jesuit martyrs Isaac Jogues, Jean de Brébeuf, and their companions, murdered by the Iroquois in their war of extermination against the Hurons.

In 1659 the church received its first bishop, François de Montmorency Laval (*q.v.*), who organized parochial life in Quebec and left on it the enduring mark of his own zeal and austerity. Missionary activity resumed after 1660 and continued for a century. Though the Indians of eastern Canada became Catholic, the history of the missions within what became the United States is that of a handful of zealous priests labouring with only moderate success among a sparse aboriginal population. While the Indians of Maine were converted, missions among the Iroquois, a confederation usually hostile to the French, were abandoned after the French defeat by England in the War of the Spanish Succession (1713). In the Old Northwest, several stations were maintained along the Great Lakes and others were founded in southern Illinois. When France occupied lower Louisiana after 1699, the church entered that area; but Indian wars ended the hopes of converting the aborigines.

When in 1763 France surrendered its empire in North America, the church had a few thousand adherents in the Mississippi Valley; their influence on the later American church was small. In Canada, however, some 65,000 Catholics preserved their devotion to their

ancestral church, and from these developed the later church in Canada.

2. 17th–18th-Century Catholic Immigration.—The strongest Roman Catholic Church in the western hemisphere developed not from Catholic Spain or France but from Protestant England. The American church grew from that small group of English Catholics who under the leadership of the Calvert family in 1634 planted the colony of Maryland as a place of refuge from the harsh anti-Catholic laws of England. It was the first English colony founded, whether from principle or expediency, on religious toleration. While in the 17th century the English were expanding along the Atlantic coast, the church existed only in southern Maryland, where priests were permanently stationed. Jesuits came with the first settlers and served continuously down to the American Revolution. They were few in number—at times only one or two, and until the 18th century never more than five or six.

Under the Stuart Restoration the colonies, pushed by England or guided by such proprietors as William Penn, extended religious toleration even to Catholics. Yet anti-Catholic sentiment flourished as vigorously in the colonies as in the British Isles, and after the revolution of 1688 put William and Mary on the English throne colonial Catholics were the targets of discriminatory laws. Royal governors were ordered to exclude them from the general toleration, and every colonial legislature enacted anti-Catholic measures. The largest number and the severest of these laws were passed in Maryland.

In this atmosphere the church suffered some defections, yet it survived and even expanded its field of operations into southeastern Pennsylvania, where Catholics were present among the many German and Irish immigrants. When at the request of their English colleagues German Jesuits arrived after 1740 to minister to their countrymen, the number of priests reached 20. In 1775 they served a small minority of 25,000 Catholics.

3. Revolutionary War and After.—By the Treaty of Paris (1763) the British Empire had guaranteed to the Canadians the right to practise their religion. By the Quebec Act (1774) Parliament not only sanctioned this right but granted to the Catholic clergy their accustomed rights and dues. (*See* also CANADA: *History: Canada as Quebec.*) Nor were the usual anti-Catholic oaths imposed on Canada; Catholics could vote and hold office. The act was greeted by the Americans with rage, as much for the toleration extended to the Catholic Church as for the extension of the boundaries of Quebec to the Ohio and the Mississippi. Consequently, when the question of independence arose, Bishop Jean Briand and his clergy opted for London rather than Boston, rejected the embassy of Benjamin Franklin and Father John Carroll (1776), and, while the English Protestant colonies revolted, kept French Catholic Canada loyal to the British Empire. To reward and preserve this loyalty Parliament by the Constitutional Act of 1791 created a special government for the province of Quebec, called Lower Canada. Though royal officials hindered the work of the church, it grew rapidly by natural increase.

With the onset of the Revolution, Catholics in the colonies south of Canada began to venture into public life. Catholic officers and men served in Washington's army and in the rebel navy. Others held office in the new state governments and sat in the Continental Congress. A Catholic signed the Declaration of Independence, and two participated in the Constitutional Convention of 1787. The Revolution gave impetus to the forces making for religious freedom, and the church profited; with satisfaction Catholics saw state anti-Catholic laws revoked and religious liberty proclaimed in the new nation.

First Bishop.—In the year the new United States installed its first president, the Roman Catholic Church chose its first United States bishop. (The colonial antipathy to prelacy had previously made establishment of a bishopric impolitic.) In 1784 the Holy See had appointed John Carroll (*q.v.*) superior of the mission in America. In 1789 his priests elected him their bishop and selected Baltimore as his see; in 1808 suffragan dioceses were created in Boston, New York, Philadelphia, and Bardstown on the frontier in Kentucky.

Trusteeism.—The American church was unaccustomed to bishops. When the laity formed a new congregation, often before there was a priest to serve them, the property of the parish was held in trust by laymen elected for the purpose. Often the trustees sought to extend their control from material to spiritual matters. During the first half of the 19th century the church was plagued by outbursts of trusteeism, recalcitrant trustees and rebellious priests rejecting the authority of the bishops and the church suffering the consequences of interdict, excommunication, schism. In time all the quarrels were patched up, and by 1860 the trustee problem had died out. In most such disputes ethnic antagonisms played a part. Trusteeism thus was an early manifestation of a major problem the church faced throughout the century: how to merge into a single church the multitudes of immigrants of varied races, nationalities, and tongues pouring into the United States.

4. 19th-Century Immigration and Anti-Catholicism.—The church changed radically in the first half of the 19th century. In 1800 it was a small and inconspicuous denomination of fewer than 50,000 members, served by about 50 priests, and led by a single bishop, son of an old American family. By 1860 it had become the largest single church in America; bishops administered 43 dioceses served by 2,250 priests and with a membership of more than 3,000,000. The hierarchy, meeting in council in Baltimore eight times between 1829 and 1852, had produced notable spokesmen, most prominent among them John England of Charleston and John Hughes of New York. A Catholic press had appeared; Catholic schools were increasing in number. Canvassed by visitors from America, the church in Europe sent over a constant stream of priests and religious to reinforce the American clergy. Financial subsidies came from the French Society for the Propagation of the Faith and other lay organizations. The main contribution of the European church, however, was immigrants by the scores and hundreds of thousands.

While the newcomers were from all the countries of Europe, the large majority were Irish and German. Most, from choice or necessity, remained in the towns of the northeast, where they were highly visible and to many native Americans highly unwelcome. They were poor, uneducated, alien; they were blamed for the slums into which they were crowded and for the intemperance and crime which the slums produced; the power of their votes was feared and their complaints about the common schools (*see* below) were resented. After 1830 the ancient anti-Catholic bias revived and, fed by press and pulpit, grew strong. The result was violence: the 1840s and 1850s were marked by unpunished outbursts of riot and arson. In the field of politics the anti-Catholic movement achieved notable successes. The American or Know-Nothing Party won control of many cities and states and in the election of 1856 presented a presidential candidate who received 871,000 votes. But before the rising threat of secession and civil war the anti-Catholic movement subsided. (*See* KNOW-NOTHING PARTY.)

Nativism, however, was not finished. In the 1880s, now more a rural than an urban movement, it flared up again in the American Protective Association. Violence was no longer condoned, however, and the bigots were attacked by the urban press and the liberal Protestant pulpit. These tendencies became more pronounced when, after World War I, the Ku Klux Klan (*q.v.*) waged its campaign against Negro, Jew, Catholic, and alien alike. Anti-Catholic bias was present in the presidential campaign of 1928; its relative ineffectiveness in the election of 1960 suggests that as a factor in national life nativism has lost its force.

Reaction to recurring nativist attacks produced in U.S. Catholics what has been termed a "siege" or "ghetto" mentality. Accused of disloyalty to their country because of subservience to a foreign potentate, Catholics were prone to respond with ardent protestations of devotion to the United States. Only with the weakening of nativism has this defensive attitude been relaxed.

5. Growth of a National Church.—Before the Civil War Catholics, save for mavericks like Orestes Brownson (*see* BROWNSON, ORESTES AUGUSTUS), played little part in the mainstream of American life. On the defensive against nativist assaults, they learned to be suspicious of reformers; an enthusiastic abolitionist was often an equally enthusiastic religious bigot. Though there

were Catholic slaves and masters in Maryland and Louisiana, the church took no stand on the institution of slavery, and during the war Catholics followed their sections; chaplains and nursing nuns served both Confederate and Union forces. When the bishops met in the second Plenary Council of Baltimore (Oct. 7–21, 1866), they considered the problem of the freedmen but did not devise a national policy on the question; they had more pressing problems to consider.

The main problem was to keep the immigrants in the church of their fathers. The tide of immigration rose after the war, and the numbers of Catholics doubled and tripled. By 1900 the church membership figure had passed 10,000,000, the number of priests had risen to 12,000 and the number of dioceses to 82. And the problem of nationalities had become even more complicated. While Irish and Germans continued to arrive, increasing numbers of Catholics came from southern and eastern Europe, others entered from Quebec, and Spanish-speaking Catholics moved north into the country. Roman Catholics of Eastern rites appeared among the immigrants.

Although the problem was immense, a solution was achieved, not without stress and not without loss. To minister to the newcomers in their own tongues, hundreds of churches were opened not as territorial but as national parishes. Catholics of the Oriental rites received their own churches and eventually their own bishops. In 1916 languages other than English were used in over 5,750 churches.

The immigrants, strangers in a strange land, wished to preserve their church as they had known it in Europe, and they wanted their own priests, independent of the American bishops. Had this tendency—called Cahenslyism after Peter Cahensly, a German worker for immigrants—prevailed, the American church would have been split into a dozen national bodies. With the support of Rome, the U.S. hierarchy opposed the movement, and with the passing of the years and the absorption of the immigrants it died out. The Polish National Catholic Church represents the only permanent schism suffered by the American church.

In meeting the problem two tendencies developed among the U.S. bishops. A liberal group headed by John Ireland (*q.v.*), archbishop of St. Paul, wished to force the rapid Americanization of the immigrants and the integration of the church into American society. A conservative group, led by Michael Corrigan of New York and Bernard McQuaid of Rochester, wished to delay the process. The debate was at times acrimonious and public; and it was seized upon by conservative priests in France to accuse the American church of a novel heresy: "Americanism." In 1899 Pope Leo XIII intervened and quieted the disputants. (*See* also AMERICANISM CONTROVERSY.)

6. French and English Canada.—The Catholic tendency to feel isolated and defensive was even more pronounced in Canada than in the United States. French-speaking Catholics felt uneasy when Canada was reunited by the Act of Union of 1840, though they were appeased by an act of 1851 guaranteeing all religions complete equality. When English-speaking Catholics migrated to Canada after 1820, they did not merge with the French; an English-language church rose in the Maritime Provinces and in the West. The church in Quebec flourished, but some French felt they were being overwhelmed by the tremendous majority of Anglo-Saxon Protestants in North America. Consequently they turned, led by the "beavers," to a defense of their own culture. Maintenance of French-Canadian culture, which includes membership in the Catholic Church, continued to present problems in Canada in the second half of the 20th century. (*See* also CANADA: *History.*)

7. The Church and the Labour Movement.—Directing a church composed largely of workingmen and their families, the U.S. bishops were concerned about trade-union movements. Recognizing in the days of rampant capitalism the need for secrecy in labour organization, the bishops in the council of 1866 specifically exempted trade unions from the general condemnation of secret, oath-bound societies, an exemption repeated in the third Plenary Council of Baltimore (Nov. 9–Dec. 7, 1884). They did not promulgate in their dioceses the condemnation of the Knights of Labor secured by Archbishop Elzéar Taschereau of Quebec in 1884 from the Roman Congregation of the Holy Office, and James Cardinal Gibbons (*q.v.*), archbishop of Baltimore, intervened in Rome in 1887 to have the decree suspended.

In later labour unions Catholic membership bulked large; it has been suggested that Catholic leadership played an important part in preserving American unions from radical domination. In the Great Depression of the 1930s scores of Catholic labour schools were opened, and organizations were formed to exert Catholic influence on labour, best known among these being the Association of Catholic Trade Unionists (ACTU, founded 1937) and the Young Christian Workers (*see* CATHOLIC ACTION). The latter group exists also in Canada, where alone were Catholic trade unions attempted; these unions came together in 1951 in the Confédération des Travailleurs Catholiques du Canada (CTCC).

8. 20th-Century Status.—In the 20th century the church in North America continued to grow. The Canadian census of 1901 showed that 2,229,600, or 41.7% of a population of 5,371,315, considered themselves Catholic; the census of 1961 indicated that 45.7% were Catholic (8,342,826 out of a total of 18,238,247). Two-thirds were French-speaking and almost 80% were concentrated in the provinces of Quebec and Ontario. The Canadian church at that time had 4,750 parishes served by more than 14,000 priests; it was divided into 59 dioceses and eight vicariates apostolic.

Comparable statistics show an equally impressive growth in the United States. The census of 1900 reported a U.S. population of 75,994,575, of whom 10,774,989 or 14% were Catholic. In 1960, when the population totaled 179,323,175, Catholics had increased to 42,104,900, or 23.5%. In the 140 U.S. dioceses during the 1960s over 54,000 priests served some 17,000 parishes.

The constant growth of church membership has produced among U.S. Catholics a preoccupation with brick and mortar. To serve the immigrant masses in the crowded cities of the late 19th century, commodious churches and schools had to be constructed. In the mass migration to the suburbs after World War II were large numbers of Catholics who were advanced in wealth and social standing beyond their immigrant forebears but who necessarily continued their tradition of building large edifices for worship and education.

The concern for material building, however, has apparently not precluded a growing appreciation of the spiritual values of religion. Since World War II, vocations to the contemplative religious orders have grown appreciably; the laity annually crowd the houses of retreat; lay men and women have formed study clubs and enrolled in formal courses of theology; and organizations have been created (*e.g.*, Christian Family Movement, Cana Conferences) to bring the faith to bear on the problems of modern life.

The increasing strength of the Canadian and U.S. churches was recognized when in 1908 they were removed from the list of missionary territories under the jurisdiction of the Roman Congregation of the Propagation of the Faith. Apostolic delegations had been opened in the United States in 1893, in Canada in 1899. In 1909 the bishops of Canada met in their first plenary council. During World War I the U.S. bishops met in the National Catholic War Council, which after the war continued as the National Catholic Welfare Council and after 1923 as the National Catholic Welfare Conference (NCWC). Acting as a central agency organizing and coordinating efforts to carry on the church's social mission, the NCWC affects many aspects of Catholic life, as indicated by the names of its departments: executive, education, press, immigration, social action, legal, youth, and lay organizations. The Canadian church set up an organization similar to the NCWC in 1948.

An indication of the increasing importance within the universal church of the churches of North America was manifest at the first session of the second Vatican Council in 1962. The U.S. church ranked second among the hierarchies of the various national churches, exceeded only by the Italian church, and the Canadian church ranked fifth in the number of council fathers.

9. Education.—In North America the Catholic Church main-

tains a larger number of schools, of all grades from elementary through university, than in any other area of the world. The first schools appeared in the colonial period, though in a sense the early missions to the Indians were educational institutions, and it appears that the Franciscans conducted a secondary school in Florida as early as 1606. In Quebec the Jesuits opened elementary schools in 1625 and founded their college in 1635. In 1639 Ursuline nuns in Quebec started a school for girls, and in 1727 they opened their girls' school in New Orleans. Bishop Laval initiated his seminary for the training of priests in 1663. In the British colonies, a few Catholic schools were attempted, though, banned by English law, they avoided public notice. There is evidence that schools conducted by Jesuits or laymen existed briefly in Maryland after 1640. In 1775, however, no Catholic school was open in the 13 colonies.

With the emergence of the church after the Revolution, Catholic schools began to appear. St. Mary's parish in Philadelphia had an elementary school in 1782; in 1791 the first seminary, St. Mary's in Baltimore, opened, and the first student entered what is now Georgetown University; in 1799 Visitation Academy in Georgetown began as the first secondary school for girls.

Universities and Colleges.—As the American church expanded, so did its schools. About 100 Catholic colleges were opened before the Civil War, and though many of these soon closed, most major Catholic universities now in existence are numbered among the 32 that originated before 1860. While nuns conducted hundreds of academies for girls, the first Catholic women's college was not attempted until 1896; by 1955, 140 were educating more than 50,000 young women. Colleges for men continued to increase after 1865. Many followed the pattern of other U.S. colleges, seeking university status by the addition of graduate and professional schools. By 1960 there were 250 Catholic colleges and universities in the United States enrolling more than 300,000 students, both men and women.

In British Canada many colonial schools continued their existence. In 19th-century Quebec there were established two dozen classical colleges, patterned more on European than on American models, designed to prepare students for entrance into a university. The first Canadian Catholic university was inaugurated in Quebec in 1853; a half dozen others were founded later. In the mid-20th century, the tendency in Canada was to open Catholic colleges affiliated with non-Catholic universities rather than to establish new Catholic universities.

Elementary and Secondary Schools.—The church's greatest efforts have been expended on elementary education, and this area has been and continues to be the focus of controversy in both the United States and Canada.

In Lower Canada after 1791 the church conducted large numbers of primary schools staffed chiefly by women religious and supported by the public treasury. When Canada was reunited in 1840, the Catholics, fearful for their French language and their faith, demanded that these schools be continued. The united government thereupon provided that churches might obtain tax funds to support their schools. In Quebec and Ontario both Catholic and Protestant churches maintained schools. When in the 1850s the Catholic schools in Ontario were attacked, the Protestants of Quebec came to their support. Eventually the dual system of church schools was accepted and extended into secondary education.

When in 1867 the British North America Act created the Dominion of Canada, this organic law stipulated, largely to quiet the fears of Quebec Protestants, that church schools must be maintained as they existed at the time of confederation. The dual system in Quebec and Ontario continued. In the Maritime Provinces, where no separate schools existed, a *modus vivendi* was gradually reached; Catholic children were assigned to schools taught by Catholic teachers. Of the western provinces, Alberta and Saskatchewan entered the dominion with separate religious schools. So too did Manitoba, but in 1891 it ended public maintenance of church schools. There and in British Columbia, which did not support denominational schools, Catholic dissatisfaction was occasionally manifest.

In the dominion the church conducts around 6,600 elementary and secondary schools with an enrollment of nearly 1,000,000. A large proportion of the 47,000 Canadian sisters are engaged in education; their colleagues include priests, brothers, and an increasing proportion of lay men and women. (*See* also CANADA: *Administration and Social Conditions: Education.*)

In the United States after 1825, when the public school system began to be extended, there were only a handful of Catholic elementary schools. But the Catholic population soon learned to regard with suspicion the common schools, which reflected the majority society they served and thus were Protestant-oriented in a period of intense nativism. Protests against anti-Catholic textbooks and teachers proved ineffective; objections to the forced use of the King James version by Catholic pupils were interpreted as attacks on the Bible. A decisive contest occurred in New York after Gov. William Seward proposed that the state revert to its earlier practice of allotting tax funds to denominational schools. When in 1841 Bishop Hughes sought to obtain such funds, the public debate ended in the rejection of the Catholic request. In subsequent years state after state enacted laws or constitutional provisions forbidding the grant of public funds to denominational institutions.

Catholics shared the common American belief of the time that religious instruction was an essential part of education. Since the common schools could not teach the Catholic religion, and indeed often imperiled it, the church turned to the construction of parochial schools. Gradually the objective of a desk in a Catholic school for every Catholic child was evolved, and this policy was formally adopted by the third Plenary Council of Baltimore in 1884. At the time, 2,532 of 6,613 parishes maintained parochial schools. The objective was never attained; so great are the difficulties, it appears likely it never will be.

In the 1890s the intrachurch "school controversy" broke out, again representing opposing views of a "liberal" wing led by Archbishop Ireland and a "conservative" wing. Archbishop Ireland advocated what became known as the Faribault plan: in essence, public schools staffed by Catholic teachers and imparting religious instruction outside school hours. Conservatives, regarding the plan as an attack on the parochial schools, strengthened their commitment to them.

In the 20th century, parochial schools continued to expand. The 3,800 elementary schools with 900,000 pupils of 1900 mounted in 1920 to 5,852 schools with 1,701,213 pupils, in 1940 to 7,597 schools with 2,108,892 pupils, and in 1960 to 10,372 schools with 4,285,896 pupils. The Catholic educational system reflected also the increasing U.S. interest in secondary schools. In 1900 there were about 260 Catholic schools with around 35,000 students; by 1920 this number had mounted to 1,552 with 129,848 students, and in 1940 to 2,361 with an enrollment of 480,483. In the next 20 years, though the number of Catholic high schools increased only to 2,433, the enrollment almost doubled, to 844,299. All these figures continued to increase after 1960. Schools and colleges are served by the National Catholic Educational Association, formed in 1904.

To serve children without places in Catholic schools, religious instruction classes, staffed by religious or by lay members of the Confraternity of Christian Doctrine (an organization founded for this purpose), have an enrollment of nearly 3,500,000. Students in non-Catholic colleges and universities are served by Newman clubs.

The problems of Catholic education, like those of American education in general, have grown with growing enrollments. Recruitment of teachers remains a serious problem. Religious orders of men and women provide a large part of the personnel, the majority of some 12,000 brothers and over 175,000 sisters in the United States being engaged in education. Lay men and women, too, have always taught in Catholic schools, and their number sharply increased with the tremendous growth of the schools after World War II.

The problem of finance is perennial, and in the 1950s it approached the critical stage. The constantly rising expenditures required to maintain schools and to construct new buildings

forced a search for solutions to the problem. Various expedients have been tried: to stop new construction; to drop some classes; to have parochial school students attend part time at local public schools (the "shared time" plan). The very presence of the Catholic Church in education has been questioned; suggestions have been made that the church withdraw from either elementary or secondary education.

With the introduction of the question of federal aid to education, the controversy over denominational education became in the 1950s and '60s as lively as it had been in the 1840s. Since many Catholics believe that the parochial schools serve a public as well as a religious function, they contend that they are paying a double tax to support the public schools. They have sought, at times successfully, to procure from state or local government such benefits as free health services, textbooks, and bus transportation for parochial as well as public school pupils. Opponents of these measures have viewed them as breaching the wall of separation between church and state and have contested them in the courts. The common Catholic contention that the federal government should not exclude Catholic school pupils from any national measures to support general education has raised a question of high constitutional import. (*See* also PAROCHIAL EDUCATION, U.S.)

10. Hospitals.—The sisterhoods, besides their identification with schools, are also known for their care of the sick, the aged, and the orphaned. The first hospital in North America, the Hôtel Dieu, was established in 1639 in Quebec by Augustinian nuns, and by the 1960s Catholic hospitals in Canada numbered 780 with over 22,000 beds; homes for the aged and orphans totaled 420 with 75,000 inmates.

Similar works were undertaken in the United States soon after the establishment in the early 19th century of the first sisterhoods. In 1814 Sisters of Charity opened the first Catholic orphanage, in Philadelphia, and in 1828 they initiated the first Catholic hospital, in St. Louis. Since then the number of orphanages has mounted to nearly 275, taking care of over 25,000 children; homes for the aged total 335 and serve more than 33,000 persons. General and special hospitals in the United States under Catholic direction number around 950, serving over 14,000,000 patients annually; these hospitals also conduct nearly 350 nurses' training schools with an annual enrollment of 35,000.

11. Home and Foreign Missions.—*Domestic.*—Themselves the products of missions, and missionary territories until 1908, the churches of North America have manifested an increasing interest in propagating the faith. Missions to the American Indians, disrupted by war and revolution after 1754, were resumed at the earliest practicable moment; the Council of Baltimore of 1833 called the attention of the faithful to the needs of Indians and Negroes. In the 1840s an abortive attempt was made to plant a mission in Africa. In the United States, missions to the Indians were pushed through the Rocky Mountains to the West Coast, and, in Canada, north to the Arctic. These missions are still maintained: in Canada, served by a staff of 1,200, half the aborigines are Catholic; in the United States, a third of the Indians profess the faith.

Since the 19th-century American church was an immigrant church, it had little contact with Negroes, a situation that has changed increasingly since 1865. Notable work has been done by religious orders, especially by societies created for the field, as the Society of St. Joseph and the Sisters of the Blessed Sacrament, founded by Mother Katherine Drexel. With the migrations from the South to the North during and after World War I, the church came into closer contact with Negroes, and the efforts of the Catholic interracial councils and the strong stand of Catholic bishops against segregation in Catholic institutions may be considered at least partly responsible for the fact that in the 20 years after 1940 the number of Negro Catholics more than doubled, to over 660,000.

Efforts are increasingly made to acquaint non-Catholic Americans with the church: the Knights of Columbus finance a continuing advertising campaign in secular magazines and newspapers; correspondence schools in Catholic doctrine serve scores of thousands of inquirers; Catholic information centres are widely maintained. Since 1905 the Catholic Church Extension Society has assisted struggling parishes in non-Catholic areas, and such societies as the Glenmary Home Missioners (founded 1939) have risen to supply priests for these churches. After 1946 the number of converts was never less than 100,000 a year.

Foreign.—Until the 20th century the U.S. church, continually short of personnel, could send few to foreign missions. Itself the recipient of substantial financial aid from European mission societies, it began to repay its debt after the Civil War by increasing contributions to the Society for the Propagation of the Faith. With the church in Europe devastated by depression and two world wars, the American church emerged in the second half of the 20th century as the chief source of financial support for Roman Catholic foreign missions.

The formal entrance of the American church into foreign missions can be dated in 1893, when overseas mission territories were first assigned to U.S. religious orders. Increasing interest led to the establishment in 1911 of the Catholic Foreign Mission Society of America, the Maryknoll Fathers. Canadian and U.S. priests, brothers, and sisters work in missions in Asia, Africa, and Latin America. (*See* also MISSIONS: *Later Roman Catholic Missions.*) The Canadian church maintains a foreign missionary staff of over 2,700. The U.S. interest in foreign missions can be shown by the increase in overseas personnel, from 2,230 in 1940 to more than 7,000 in the years after the war. The laity also entered the mission field under the auspices of a number of organizations, notably the Papal Volunteers for Latin America (PAVLA; *see* above, *Spanish America: 20th Century*).

12. Press.—In the 13 British colonies Roman Catholics desired to avoid attention; no Catholic work was ever printed. After the Revolution, however, Catholic pamphlets and books began to appear, and by the early 19th century Irish newspapers (as the *Hibernian Chronicle,* 1810), containing items of Catholic interest, were published. The first distinctly Catholic periodical, the weekly *U.S. Catholic Miscellany,* came out in Charleston in 1822 and continued to 1861. The first Council of Baltimore in 1829 urged the creation of a Catholic press, and in the 1830s a number of diocesan newspapers were founded. In the 1840s still other periodicals rose to answer the attacks of the nativist press. A Catholic foreign-language press appeared before the Civil War and increased notably with the new immigration after 1880. By 1900 Catholic periodicals were being published in a dozen languages, including Sioux. To the newspapers were added popular monthlies and serious quarterlies, as Isaac Hecker's *Catholic World* (1865) and Orestes Brownson's *Brownson's Quarterly* (1844).

The 20th century witnessed the proliferation of Catholic periodicals. Practically all dioceses have their own newspapers or are served by the *Register* (1905) or *Our Sunday Visitor* (1912) chains. A Catholic press association set up in 1908 has been since 1919 a service of the National Catholic Welfare Conference. There are Catholic periodicals for all tastes and types, from children to serious scholars. In 1940 about 350 periodicals circulated to some 8,000,000 subscribers; by the 1960s the numbers were, respectively, 500 and 27,000,000. (F. X. C.)

D. AFRICA AND THE ORIENT

The Roman Catholic Church reached Asia, Oceania, and Africa comparatively late. It should, however, be remembered that Christianity began in the Middle East. From its starting point in Palestine it rapidly spread to Asia Minor, North Africa, and the other Middle-Eastern countries of the Roman Empire. The Persian empire and Armenia were evangelized in the 3rd century, Arabia and Ethiopia in the 4th century, and parts of India by the 6th century. Already in the 5th century Nestorianism and Monophysitism had detached large bodies of Christians in the Middle East from communion with Rome, and the 7th-century Arab conquests obliterated Christianity in North Africa. From 1054, the year of the formal schism between Rome and the Orthodox Eastern Church, the Roman Catholic Church was present in the Middle East only in the Maronite community in Lebanon. The period of the Crusades (11th–13th centuries) witnessed the creation of

a Latin empire in Constantinople (1204–61) and an attempt to establish a Latin church there. The principal result of these unfortunate events was consolidation of the antagonism dividing the two halves of Christendom.

1. Later Middle Ages.—The new Roman Catholic missions outside the western and Mediterranean areas date from the 13th century. The recently founded mendicant orders—Franciscan and Dominican—were the principal agents of this new type of mission and, with no political support and very limited material resources, the friars traveled throughout Asia. One of them, Giovanni di Monte Corvino (*q.v.*), established the church at Peking between 1294 and 1328. But the fruits of his mission were lost in the downfall of the Mongolian empire. On the other hand, the difficult traveling conditions, the fact that Islam had encircled Europe, and the internal crisis that the church was going through at that time made it impossible for this missionary endeavour to receive the support necessary for continuity.

2. 16th and 17th Centuries.—In this period further great efforts were made with more durable results. In the Middle East, several Eastern rite Christian communities of varying size were reunited with Rome, and gradually the foundations were established of a new Roman Catholic hierarchy which continued to develop.

However, the major missionary endeavour of the 16th century was accomplished in the Far East. Two Catholic maritime powers, Spain and Portugal, were establishing sea routes to the farthest countries, creating commercial outlets wherever they went and imposing political domination in certain regions. In 1493 Pope Alexander VI officially recognized the spheres of influence of these two countries (*see* TORDESILLAS, TREATY OF) and accorded to their kings a right of patronage over the missions established (*see* above, *Spanish America: The Spanish State and the Church*). The expansion of the church was favoured by this agreement, which facilitated transport and the establishment of missions. The Spanish Philippines and the Portuguese territories of Goa in India (diocese in 1533) and Macao in China (diocese in 1575) became almost entirely Catholic. The foundation of the Society of Jesus in 1534 supplied the missions with new manpower.

Oceania, the coastal areas of central and southern Africa, and Madagascar received some rapid and superficial evangelization. The Catholic kingdom of São Salvador do Congo (Angola) was a short-lived and only partially successful undertaking which was ruined by the negligence and the commercial intrigues of the Portuguese. In 1541 a Portuguese colonial archdiocese was erected at Funchal (Madeira), having jurisdiction over the whole of West Africa; this was replaced in 1532 by the archdiocese of São Tiago (Cape Verde Islands), while East Africa was attached to the archdiocese of Goa in India.

At that period, the adoption of Christianity by an Eastern country usually meant the adoption of Hispano-Portuguese customs also, a fact which did much damage to the later spread of Catholicism in Asia. Two notable exceptions to this rule were the missions in India of Roberto de Nobili (1604) and in China of Matteo Ricci (*q.v.;* 1582–1610), both of whom respected the civilization and culture of the country they evangelized; but their policy was not continued.

The inherent defects of the patronage system became more and more apparent. Missionary work was often impeded by the temporal interest of the European power to which it was bound, and in the 17th century Rome endeavoured to liberate the missions from this inefficient and cumbersome tutelage. In 1622 Pope Gregory XV founded the Sacred Congregation of the Propagation of the Faith (*Propaganda Fide*), to coordinate from Rome all the Catholic missions throughout the world. This congregation provided the missions with a purely ecclesiastical organization, unified their methods, and guided them toward the establishment of local churches.

By 1627 the Propaganda Fide College was established in Rome for the training of priests from the mission countries. One of the first students of the college, Matteo de Castro, an Indian brahmin, was made a bishop in 1635 and named vicar apostolic in 1637. This was a new departure: instead of resident bishops whose nomination was subject to the patronage agreements, Rome designated as vicars apostolic bishops directly delegated by the Holy See. This system extricated the missions from the bonds of patronage and permitted a greater development. Conversions increased in China, Ceylon, and especially in the Indochinese peninsula. This development was largely due to the increased personnel that the newly founded (1663) Société des Missions Étrangères de Paris placed at the exclusive disposal of the Congregation of the Propagation of the Faith.

The instructions from *Propaganda Fide* also aimed at renewing mission methods. Particularly noteworthy is the famous instruction of 1659 to the first vicars apostolic in the Far East: the missions must have no political association, must respect local customs and cultures, and must aim at rapid formation of an indigenous clergy and episcopacy.

In the meantime, non-Catholic powers, notably England and Holland, soon to be followed by all the Western powers, were disputing the Spanish and Portuguese rights to world supremacy. In Japan, persecution of Christians, which began early in the 17th century, drove out all the missionaries and destroyed or drove underground the Catholic communities even before the country formally adopted its policy of excluding all westerners (*see* JAPAN: *History: The Tokugawa Period*). In Ceylon, which had become a Dutch possession, to be a Catholic was considered equivalent to political loyalty to Portugal.

In China, Adam Schall and after him Ferdinand Verbiest with their fellow Jesuits gained the respect of the emperor through the high standard of their scientific work. Some religious toleration was thus acquired within the Chinese empire. Unfortunately, however, the "quarrel of the rites" arose between the protagonists of two different mission theories (*see* RITES CONTROVERSY), lasted more than a century, and caused considerable harm to the church, especially in China and India. However, at the end of the 17th century the prospects in Asia as a whole were good. (*See* also MISSIONS: *Early History: Roman Catholic Advance, 1500–1750.*)

3. 18th Century.—The hopes held out by the 17th century were not fulfilled in the 18th. Bloody persecutions in Asia, together with various difficulties in Europe, slowed the missionary effort and endangered the results already achieved. The political rule of the marquês de Pombal ruined the Portuguese missions. The suppression of the Society of Jesus in 1773, the French Revolution in 1789, the Napoleonic era, and the new conflicting ideas at work in Europe dried up the wellsprings from which missionary vocations had come. For the Catholic missions, the 18th century was a period of crisis.

4. 19th Century.—In the course of the 19th century the missions were carried on with renewed vigour. Missionary personnel was considerably increased not only by the contribution of the older religious orders but also by the foundation of numerous religious orders dedicated especially to the missionary apostolate. This renewal made it possible to reap the harvest so painfully prepared during the preceding centuries in Asia and, at the same time, to undertake systematic evangelization in Oceania and Africa.

Oceania.—Thus, in 1825, the Picpus Fathers were given the responsibility for Oceania; in 1836 they were joined by the Marists, who assumed responsibility for central Oceania and New Zealand. In Australia, Catholicism was introduced especially through the Irish immigrants. Unfortunately, the colonial rivalry between France and Great Britain was paralleled by conflict between Catholic and Protestant missionary movements, which complicated the work of evangelization in Oceania.

Southern Africa.—In Africa south of the Sahara, which had by then been thoroughly explored, missionary work was systematically organized also. The first stage was the creation, by Gregory XVI in 1841, of the vicariate of the "Two Guineas," which extended from Senegal to the Cape of Good Hope and gave rise to all the West African missions; it was entrusted in 1845 to the Holy Ghost Fathers. In 1846 the apostolic vicariate of Central Africa was set up, and the evangelization of East Africa was begun in 1878 by the Jesuits and the Society of Missionaries of Africa (White Fathers), founded in 1868 by Charles Cardinal Lavigerie. At the close of the 19th century there were 500,000 Catholics in Africa

south of the Sahara, administered by 61 ecclesiastical territories.

Far East.—In Asia, the renewal became apparent only toward the middle of the 19th century. After 250 years during which the church was banned, Japan opened its doors once again to missionaries in 1858, and a few years later (1865), in Nagasaki, groups of Japanese revealed that they had remained faithful to the Catholic faith into which their ancestors had been baptized in the 17th century. Freedom of religion was proclaimed in 1889, and in 1891 Leo XIII established the normal ecclesiastical hierarchy with an archbishop at Tokyo and three episcopal sees at Nagasaki, Osaka, and Hakodate. At that time Japanese Catholics numbered 50,000. In Korea there were frequent persecutions until 1881, when the missionaries returned to that country. Freedom of religion was proclaimed in 1884, but persecution had left only about 10,000 Catholics. In China also, a decree published in 1811 launched a persecution which lasted until 1844. At that date, the protection of the missions was assured by the French, whose example was shortly afterward followed by other Western powers having political and commercial interests in China. The ambiguous situation in which the missions were thereby placed permitted the church to enjoy some measure of progress, but at the same time it compromised it in the eyes of the Chinese. At the end of the 19th century there were more than 800,000 Catholics in China, but the antiforeign Boxer Rebellion of 1900 led to a general massacre of Chinese Christians and of the missionaries. (*See* also CHINA: *History.*)

Southeast Asia and India.—In Vietnam, from 1802 to 1825, Christianity was relatively free, thanks to the emperor Gia-Long, and 316,000 were baptized. But Gia-Long's successor, Minh-Mang, closed the country to missionaries and instituted a persecution which, except for a few brief intervals, lasted from 1833 to 1862 and counted at least 90,000 victims. French rule, established in 1883, secured religious peace, and at the end of the 19th century Vietnamese Catholics numbered more than 700,000. (*See* also VIETNAM: *History.*)

Progress in neighbouring countries was much slower. In Thailand the mission, which had been halted by persecution lasting throughout the 18th century, was resumed in 1826 and freedom of religion was proclaimed in 1856. Organized missionary work was not begun in Cambodia till 1850 and in Laos not till 1899.

In India, abolition of the Portuguese "patronage" system in favour of the apostolic vicariates established by *Propaganda Fide* brought about a considerable revival from 1832. In 1884 an apostolic delegate was named to represent the Holy See in India and Ceylon, where the normal hierarchy was established in 1886, comprising seven ecclesiastical provinces. In 1896 three Indian bishops were named for the Syro-Malabar communities. In Chota Nagpur, the social action of the Jesuit Constant Lievens set in motion a mass movement of conversions, and the numbers of Catholics rose from 16,000 to 60,000 (in 1920 there were 170,000 and in 1960 there were 500,000 in this area).

In Burma, in the first half of the 19th century, the missions did no more than survive, owing to the Anglo-Burmese wars; from 1856 they began to develop slowly. In Indonesia, any form of proselytism was forbidden by the Dutch until 1807, when freedom of religion was established in Holland. An apostolic prefecture was then established for Java, and in 1826 the prefecture was extended to include the whole of the Indonesian archipelago. However, the mission was confined almost exclusively to European residents and was severely restricted by the civil authorities. Catholic missions became established only in the second half of the 19th century.

The Arab World.—The Ottoman Empire was beginning to disintegrate, and the European powers, under the pretext of defending Christian minorities, were beginning to establish a footing, thus causing reprisals against the Christians. On the other hand, under the millet system of dealing with non-Muslim religious communities prevailing in the Muslim states (*see* RAYAH), Roman Catholics of the Eastern rite were subject to the authority of the Orthodox patriarchs. After a long struggle the Melkite Catholics achieved emancipation from this tutelage in 1848, the Chaldaeans in 1861, the Syrians in 1866, and the Egyptian Copts in 1898. From 1830, Latin missionaries were sent from Europe to the Middle East, where they opened schools and seminaries. The intention of the pope was not that they should establish the Western (Latin) church but that they should give fraternal help to the Eastern rite Catholics. But the multiplicity of Latin religious establishments and the restoration in 1847 of the Latin patriarchate of Jerusalem (created at the time of the Crusades and fallen into disuse in the 13th century) led, little by little, to the establishment of the Latin church side by side with the Eastern rite churches. On the other hand, the numbers of Eastern rite Christians in union with Rome continued to grow, and their patriarchates were reestablished (*see* above, *The Catholic Eastern Rites*). And finally the Roman Catholic Church found a footing once again in Ethiopia with the arrival of the Lazarists of Justin de Jacobis in 1839 and the Capuchins with Guglielmo Cardinal Massaia in 1846. As for the Maghreb regions of North Africa, the Roman Catholic Church was established there from 1830 but remained confined almost exclusively to the European immigrant population.

5. 20th Century.—The ecclesiastical structures established in the previous century in Asia and Africa now took on the character of local churches, and the Roman Catholic Church strove to break its identification with the political and cultural supremacy of the West by the vigorous affirmation of its "supranationality."

Development of Indigenous Clergy.—The missionary encyclicals *Maximum illud* of Benedict XV in 1919 and *Rerum ecclesiae* of Pius XI in 1926 placed great emphasis on the importance and the urgency of the need for more Asian and African clergy. In spite of the remarkable effort in the 19th century, the essential aim of the missions to enable the church to take root in the different countries and to take on a local character had been somewhat neglected. Realization of the pope's instructions was facilitated by the establishment of regional seminaries, which made available better training to the clergy through grouping of existing facilities. Due to these efforts, the local clergy of the mission countries grew from 4,516 in 1923 to 5,624 in 1929, to 6,406 in 1939, and to 11,139 in 1949; of these totals, the majority was in Asia.

The consecration of Asian and African bishops is a truer indication of the development of the church than is the increase in the number of priests. The first Chinese bishop, Gregory Lo Wan-tsao (known as Bishop Lopez), had been consecrated at Canton in 1685, but this was an isolated instance. In the 20th century, the Indian Jesuit Francis Roche was named bishop of Tuticorin, a newly created diocese of the Latin church which was handed over to the Indian clergy on June 12, 1923. However, the Eastern rite Malabarese church already had Indian vicars apostolic, and in 1923 a regular ecclesiastical province was created, with Ernakulam as the metropolitan see. In China the impetus was given by the apostolic delegation established by Rome in 1922. The first delegate, Archbishop Celso Constantini, selected the first six Chinese bishops and conducted them to Rome, where they were consecrated by Pius XI in 1926. From the year 1926 there was a great increase in the consecration of native bishops in the majority of Asian countries, and from 1939 in the majority of African countries.

In 1939, 52 ecclesiastical territories were administered by national Asian and African bishops and clergy; 27 of these were in China, 14 in India, 3 in Japan, 3 in Vietnam, and 1 each in Ceylon, Korea, Ethiopia, Madagascar, and Uganda. The war years retarded the movement, but after 1946 it took on considerable impetus again. By the 1960s the hierarchy of the Roman Catholic Church in Africa and the East had to a considerable extent passed out of the hands of the West. In Oceania, however, there were as yet few local clergy.

The number of Catholics in Africa and the East was estimated in the early 1960s at 50,000,000. The strongholds in the Far East were the Philippines and Vietnam and, to a lesser degree, South Korea, Ceylon, and southern India. In Oceania, the major centres were Melanesia and Micronesia; in the Middle East, Lebanon; in Africa, Uganda, Rwanda, Burundi, the Congo (Léopoldville), Cameroon, Basutoland, and the Malagasy Republic.

6. Accommodation to Traditional Cultures.—The number of the faithful and the nationality of their bishops are not the only factors necessary if the church is to be at home in the different countries. The period of cultural ascendancy of the West led to some neglect of the church's tradition of adaptation to the cultures of the people evangelized, and this tradition had to be renewed in the 20th century. Pius XII, in his encyclicals *Summi pontificatus* (1939) and *Evangelii praecones* (1951), brought this question back as one of the principal objects of attention in missionary theory. Some concrete steps taken by Rome opened the way for this adaptation: the revision of the question of Japanese and Chinese rites (1939); a Christian adaptation of the *matanga* rites in the Congo (1938); new rules concerning the Malabar rite in India (1940); and greater flexibility in general of the regulations governing ceremonies (1961).

A similar turn was taken in liturgy and catechetics. Increasingly the use of the vernacular in liturgical ceremonies and of local melodies as sacred music was being permitted; the adaptation of certain ceremonies to ancient local customs was sometimes authorized, and various experiments and studies were undertaken with a view to integrating Christian worship and way of life with the particular genius of each nation while at the same time preserving the essential truths of Christianity.

To prepare a Christian laity to assume responsibility for certain apostolic duties is also one of the major cares of the church. With the encouragement of the Permanent Committee for the Apostolate of the Laity, a congress in Kisubi (Uganda) was organized in 1953 for Africa and another in Manila (Philippines) for Asia in 1955. The traditional monastic missionary bodies were joined by lay people working through various lay missionary movements, Catholic international organizations, and similar bodies. This new accession of manpower permitted wider and more adequate action in fields not directly the concern of priests or religious. (JE. F. B.)

IV. THE LIFE OF THE CHURCH IN THE 20TH CENTURY

The most important single factor in the internal development of the church in the 20th century was the action of St. Pius X in fostering (by two decrees, of 1905 and 1910) frequent reception of Holy Communion. Not only did these decrees mark the final overthrow of Jansenism, but they set up a sort of chain reaction: those who had been admitted to communion at an early age became, as they grew up, more assiduous in attending Mass and thus more anxious, eventually, to have the Mass made more intelligible to themselves, whatever their level of culture. Hence the liturgical revival was turned into a popular movement culminating in the Constitution on the Sacred Liturgy passed at the second session of the second Vatican Council (*see* further LITURGICAL MOVEMENT, ROMAN CATHOLIC).

The international eucharistic congresses (the 38th of which, at Bombay, was attended by Pope Paul VI in 1964) were begun by Marie Tamisier, who succeeded in persuading French Catholics to hold the first congress at Lille in 1881. The congresses grew in size and scope after the one at Rome in 1905; the London congress (1908) was opened by a papal legate, whose entry into the country was at that time illegal. Cologne, Montreal, and Madrid saw the next meetings, and after the interruption of the series by World War I there were large gatherings at Chicago (1926), Sydney (1928), Dublin (1932), Buenos Aires (1935), and Budapest (1938). After World War II there were congresses at Barcelona (1952), Rio de Janeiro (1955), Munich (1960), and Bombay (1964). Discussions both theological and pastoral about the sacrament take place at these congresses, but their manifestation of the corporate life of the church is of far greater moment than any fruit of their deliberations.

When Cardinal J. H. Newman was asked what he would do if he became pope, he replied that he would set up commissions to deal with biblical questions and the early history of the church. Leo XIII set up the Biblical Commission (Oct. 30, 1902), but was too late to avert the crisis of Modernism, which left the church intellectually numbed; between the Modernists, who wanted to treat the Scriptures like any other book, and some of the theologians, who said that Scripture was altogether divine, there did not seem to be a middle way. (*See* further MODERNISM, ROMAN CATHOLIC.) A few theologians knew that there was, and in 1943 they were upheld by Pius XII, who in his encyclical on the Scriptures (*Divino afflante Spiritu*) put forward a parallel between the Incarnate Word of God and the written Word of God; heresy in each case lay at the two extremes, when the divine and human elements were held too far apart or were fused beyond recognition. The humanity of the inspired writer has to be seen, even though God is guiding him, just as the humanity of Christ was not swallowed up by the godhead. When this middle way was reached, the church was able to give full scope to biblical studies with beneficial results to theology and devotion.

The holding of a council had been suggested to Pius X in 1912 as a means of meeting the Modernist crisis. After the solution of the Roman question by the Lateran Treaty (1929) the matter was raised again, for the liberty of the church has always been a prerequisite to a council and now it seemed assured. Pius XI, who had done so much to promote missionary expansion and to reassert that the church was not to be identified with the Latin rite, might have given more permanence to his reforms through such a council, but the turbulence of the 1930s denied him the opportunity. It was left for John XXIII to seize the chance in 1962 and thus to stimulate theological activity to a degree beyond anything witnessed before in the 20th century. (*See* VATICAN COUNCILS: *Second Vatican Council.*)

It was soon after 1850 that Newman remarked on two signs of the times, the spreading over the face of the earth of the English language and of the Irish race. These factors changed the aspect of the missionary activity of the church in the 20th century. What had been in the 19th century so largely a French or Belgian affair (and almost confined to the Levant, North Africa, India, and China) was now in large measure entrusted to men who spoke English. The setting up of the Maynooth (Irish) mission to China in 1916 and the expansion in the missionary work of the Jesuit order (which had 1,600 men at work in mission lands in 1920 and 7,000 in the 1960s) are signs of this development. They are confirmed by the number of training centres set up in England, Ireland, and the United States by Dutch, French, and Italian missionary societies. In the growth of missionary work by nuns similar changes can be seen.

On March 19, 1904, Pius X began the codification of canon law (*q.v.*) that was completed under Benedict XV in 1917.

The conversion of an Episcopalian group, the Friars of the Atonement (Graymoor, N.Y.), in 1909 led to the widespread adoption of an annual church-unity octave of prayer for reunion (Jan. 18–25). (*See* ECUMENICAL MOVEMENT.) Emphasis in this movement shifted gradually from Anglicanism to the Orthodox Churches, and in 1964 the second Vatican Council decreed that limited intercommunion between Catholics and Eastern Orthodox was tolerable. As the council was ending (December 1965) the Eastern and Western anathemas of 1054 were withdrawn by a papal mission and by the patriarch of Constantinople. In March 1966 the pope and the archbishop of Canterbury, meeting formally in the Vatican, pledged themselves jointly to work for the reunion of the churches.

The second Vatican Council's dogmatic decree on the nature of the church emphasized the laity's share in the prophetic office of the church by witnessing in their lives to the gospel.

National episcopal conferences existed at the first Vatican Council in 1870. During the long sessions of the second they built up many links; a European conference was formed before the end of the council, and much mutual help was arranged. The council's decree on religious liberty came, during the debate, to be a charter for Catholics behind the "iron curtain." During the council the principle of collegiality, recognized for the hierarchy, was extended to diocesan and parochial levels, and the working out of this began slowly. Episcopal conferences were empowered to allow the permanent office of deacon to men already married, while those young men who accepted the same office were to remain single. (J. H. CN.)

ROMANCE, the name of a literary genre, difficult to define in formal terms, which originated in medieval France in the period 1130–50 (*see* FRENCH LITERATURE: *Chansons de Geste and Romances*).

The characteristic feature of early French literature is its inclination toward the wonderful, the improbable, the exaggerated, and the wholly ideal. This characteristic to some extent reflects the type of literary culture that had emerged as the culture of late classical antiquity, itself strained and rhetorical, and marked by a taste for the marvelous and the miraculous, passed into that of the so-called Dark Ages. The only type of medieval literary production exempt from these romanticizing tendencies was the family and historical prose saga developed in Iceland at the end of the 12th and in the early 13th century (*see* ICELANDIC LITERATURE: *Icelanders' Sagas*).

At the beginning of the 12th century, narrative literature in France was of two types, both in verse: stories of the saints; and the epics, or *chansons de geste* (*q.v.*). But, however productive of wonder such stories as that of St. Alexis, who left his wife on his wedding night, fled abroad and lived as a beggar, then returned, still in the guise of a beggar, to his father's house, where he lived unrecognized until at the point of death; or however marvelous the adventures of St. Brendan (*q.v.*), as he voyaged among strange islands on his way to the Earthly Paradise, the works in which these were narrated had a didactic purpose. The extravagant asceticism of Alexis, for instance, was described to inculcate contempt of the world and its vain delights, not merely to astonish. Similarly, the greatest of the French *chansons de geste*, the *Chanson de Roland* (*see* ROLAND, CHANSON DE), although "romantic" in the sense that it recounts exaggerated religious miracles and feats of arms, and introduces a love interest, has not only a serious moral purpose (to represent warfare against Islam as a holy task) but also discusses, with high seriousness, the ethics of the blood feud and the consequences of baronial pride and recklessness. In many epics written later in the 12th century, however, there is a tendency to abandon serious treatment of such subjects in favour of narrative interest, to stress the feats and adventures of the hero, and to trace his career from childhood, a common pattern being for him to flee abroad from persecuting relatives, to achieve adventures, and then to return to claim his inheritance. These stories are rather "romanticized epics" than "romances" proper, but they would never have been written if it had not been for the rise of romance. Romance, as a separate genre, is distinguished from epic and religious narrative by the

fact that it recounts fictions for their own sake, for the delight and wonder they evoke, and not for any religious, political, didactic, or edifying purpose.

Origins.—The romances of love, chivalry (*romans courtois*), and adventure (*romans d'aventure*) that arose in 12th-century France have their analogues elsewhere, notably in the novels of love and adventure developed by Greek writers from the beginning of the 1st century B.C. (*see* GREEK LITERATURE: *Hellenistic and Greco-Roman Periods: Prose: The Novel*). Some of the themes in these reappeared in the Middle Ages, but direct connection can be proved only in the case of the 3rd- or 4th-century Latin romance of Apollonius of Tyre (*q.v.*). The considerable debt of 12th-century romance to classical antiquity was contracted in a sphere other than that of subject matter. Romance, at the outset, was the creation of professional writers who had been educated in the study of Latin and in the medieval *trivium*—grammar, rhetoric, and logic—and who, writing for the amusement of aristocratic patrons, produced works primarily intended as entertainment. Like the idea of courtly love (*q.v.*) with which it is so intimately associated, romance seems to have been a by-product of the refined and leisured life that was growing up in the entourage of kings and the higher nobility in the 12th century. Thus, Benoît de Sainte Maure (*q.v.;* author of the *Roman de Troie*), Wace (*q.v.*), and Thomas (author of the courtly version of the *Tristan* romance; *see* TRISTAN; ANGLO-NORMAN LITERATURE), all apparently worked for the English royal court in the early years of the reign of Henry II and his wife Eleanor of Aquitaine; and Chrétien de Troyes (*q.v.*) had as patrons Marie, countess of Champagne (Eleanor's daughter by her marriage with Louis VII of France), and the powerful count of Flanders, Philip of Alsace.

Historical writing in the vernacular gave free scope to the spirit of romance: when approached without didactic purpose, history could be treated as a storehouse of picturesque events and romantic happenings in places and times remote from the present. The term *romanz,* originally meaning the "vernacular," as opposed to Latin, became used, in the period after *c.* 1140, for vernacular translations or adaptations of Latin works the content of which was historical or pseudohistorical. Thus, Wace's translation (1155) of Geoffrey of Monmouth's *Historia regum Britanniae* was known as *Li Romanz de Brut;* and the anonymous adaptation, of about the same date, of Virgil's *Aeneid,* as *Li Romanz d'Éneas.* As will be seen, it is with these and similar works—the story of Alexander the Great and the tales of Thebes and Troy—that romance, both as a name and as a literary genre, begins its evolution.

Narrative Technique.—Chivalric exploits recounted for their own sake, adventures that befall on a journey or a quest, romantic love—these are the staple themes of romance. Yet more important than the subject matter or the "uncommitted" character of romance writing is the development of a special technique of narration. Formally, romance is distinguished from epic by being written in rhyming octosyllabic couplets—whereas epic is written in assonanced stanzas (*laisses*), and has a balladlike structure. Yet it is not merely this change in metrical pattern that led W. P. Ker, in his *Epic and Romance* (1897), to describe the rise of romance as "a genuine revolution from which all later forms of narrative are in some degree derived" and "as something as momentous and as far-reaching as that to which the name Renaissance is generally applied." Romance introduced an entirely new relationship between what is known as the "thematic" and the "fictional" modes. The epic poet had been content to tell a story; he was concerned with statement, not with motivation, and his characters could act without explicitly justifying their actions. Thus, in the *Chanson de Roland,* the hero's decision to fight against odds and let the rearguard of Charlemagne's army be destroyed rather than to call Charlemagne back is neither explained nor discussed; as if the poet takes it for granted that the reader knows why things happened as they did. Romance, on the other hand, reflects the realization that no story, however simple, can speak for itself, and that almost anything the characters do requires explanation. Trained in the 12th-century cathedral schools where poetry was studied with grammar and rhetoric (*q.v.*), romance writers discovered in the practice of these disciplines a narrative technique which enabled them to elucidate and elaborate their material. Hence the characteristic innovation for which they are responsible, namely, the introduction of a commentary on the meaning of events, either directly by the author or through speeches attributed to the characters. It was thus the literary training of its authors that gave medieval romance its peculiar texture; that lay behind the method of amplification resulting in expansion and elaboration of simple statements; that was responsible for the systematic use of digression, and, above all, for the technique whereby actions, motives, states of mind are commented on, debated, scrutinized, and dissected. In medieval romance, in fact, can be recognized the beginning of the analytical method to which the modern novel owes its existence (*see* NOVEL).

History.—*Alexander Romance.*—In tracing the evolution of romance, one must begin with the Alexander romance (*see* ALEXANDER ROMANCES). This, in style and form an epic rather than a romance, relates the fictional biography of Alexander the Great, as established by the pseudo-Callisthenes and transmitted to the Middle Ages through Latin intermediaries, of which the 9th-century *Epitome* of the *Res gestae Alexandri Macedonis* of Julius Valerius is the most important. The *Roman d'Alexandre,* begun by Albéric de Briançon, to which several authors contributed, and which grew up piecemeal over more than half a century from the mid-12th century onward, was put into its final shape by Alexandre de Bernai (*c.* 1175). Much of it deals with wars and battles, treated in the style of the *chansons de geste,* but it is noteworthy for its introduction of fantastic elements, and especially for the marvels of India described in the third *branche,* composed by Lambert le Tort. It was mainly to these exotic and marvelous features (the springs of rejuvenation, the flower-maidens growing in a forest, the *cynocephali,* the magic ship drawn by griffons in which Alexander travels through the air) that the *Roman d'Alexandre* owed its popularity.

Romans d'antiquité.—The *romans d'antiquité: Thèbes,* an adaptation of Statius' *Thebaïd; Éneas,* adapted from Virgil's *Aeneid;* and *Troie,* a retelling by Benoît de Sainte Maure of the tale of Troy as it had been transmitted to the Middle Ages by Dares Phrygius and Dictys Cretensis (*qq.v.*), were all composed in the period 1140–65. The fact that they medievalize the classical world, in that they show the warriors of antiquity behaving very much like medieval knights, is the least important, though to modern readers, the most obvious, thing about them. More noteworthy is their technique, which reflects the influence of contemporary rhetoric in the elaborate set descriptions (of, for example, tents, garments, buildings, as well as of human beings) with which the works are studded; and in the introduction of long passages in which the characters indulge in internal debate or self-examination, generally in connection with affairs of the heart. Eulogistic description of human handiwork results in the action's being set in lavish surroundings, resplendent with gold, silver, marble, fine textiles, and precious stones, and adorned with astonishing works of architecture and quaint technological marvels, which recall the Seven Wonders of the World and the reputed glories of Constantinople. *Troie* and *Éneas* have a strong love-interest, based on Ovid's conception of love as a restless malady, and exhibiting the doubts, hesitations, and self-torment of young lovers, as in the Achilles-Polyxena story in *Troie* and the Éneas-Lavinie story in *Éneas. Troie* also gives us a story of the faithless Briseïs who abandoned Troilus for Diomedes, which, as expanded by Boccaccio (*q.v.*) in his *Filostrato* (*c.* 1338), formed the basis for Chaucer's *Troilus and Criseyde* and for Shakespeare's *Troilus and Cressida.*

Arthurian Romances.—With Geoffrey of Monmouth's *Historia regum Britanniae* (1135), adapted into French verse in Wace's *Brut* (1155), a new world of the imagination, that of Britain and the court of King Arthur, as marvelous as the world of classical antiquity and almost as remote, was opened up to writers of romance. The Breton *lais* of Marie de France (*q.v.*), composed between 1154 and 1183, and probably before 1170, are set in this "Breton" world, although only one (*Lanval*) brings in King Arthur. Marie's plots are not derived from Geoffrey of Mon-

mouth but exploit folktale material, especially stories of mortals in love with beings from fairyland. The love element is kept in the foreground and elaborated in a lavishly sentimental fashion. Thus, *Lanval* is the story of a love affair between a knight, Lanval, and a fairy: the fairy imposes on him a vow of silence which he breaks when Arthur's queen makes lascivious advances to him; he is put on trial and rescued at the last moment by the fairy, who carries him away to fairyland. The Breton *lais* became a recognized literary type, differing from romances only by being on a smaller scale.

The lost *Tristan* romance, written probably *c.* 1155, is known only through the fragmentary later versions of Thomas (before 1170) and Béroul (after 1190), and through foreign translations. The love portrayed in this tale of the adultery between Tristan and Isolt, wife of Mark, king of Cornwall, is a tragic and all-absorbing passion induced by a magic potion, and the work was clearly very different from the usual courtly romance, in which love is treated in an idyllic, gently sentimental, and somewhat intellectual manner. The version of Thomas, unlike that of Béroul, softens and sentimentalizes the story, and by rhetorical amplification and analysis of action and motive, brings it nearer to the usual pattern of courtly romance. (*See* also TRISTAN.)

Although the *Éracle* (after 1164) and *Ille et Galeron* (after 1167), of Gautier d'Arras (*q.v.*), are good examples of early courtly romance, Chrétien de Troyes is by far the most outstanding writer in this kind, and the impact on later literature of its analytic and reflective method would have been less decisive had it not been handled by so accomplished a writer. Chrétien, whose four great romances, *Erec et Énide*, *Cligès*, *Lancelot* (or *La Charette*), and *Yvain* (or *Le Chevalier au lion*), were written, in this order, *c.* 1170, and probably between 1165 and 1176, is limited to no one style or subject. He can tell with equal zeal the story of a marriage between a lord and a poor girl (*Erec*); the love story of a young knight and the wife of the emperor of Byzantium (*Cligès*); the tale of how Lancelot, the devoted and humble lover of the imperious Guinevere, the wife of his overlord, King Arthur, rescues his mistress from captivity in the land of Gorre (*Lancelot*); and the adventures of a knight who marries the widow of a man he has killed in single combat and who undertakes a series of adventures in which he is helped by a grateful lion (*Yvain*). What matters primarily to Chrétien de Troyes is not the plot, but the thematic pattern he imposes on it and the significance (*sen*, to use his own term) which he succeeds in conveying either through individual scenes fully interpreted by the characters in long monologues, or through the work as a whole, as in *Lancelot*, where the emphasis is on the theme of courtly love of the most sophisticated kind. (*See* also LANCELOT). Chrétien's stories are set in Arthur's fabulous realm, and the names of some of his characters can be traced to Geoffrey of Monmouth's pseudohistory; but the reader is not expected to take the setting too seriously. Arthur (*q.v.*) is presented as the ruler of a fanciful "never-never land," which is the scene of strange marvels and adventures; and the behaviour of the characters is judged less according to the peculiar ethics of fairyland or of fictitious chronicles than according to the code of courtly love; it is intended to exemplify either obedience to, or an occasional infringement of, some courtly rule. (*See* also COURTLY LOVE; ARTHURIAN LEGEND.)

Chrétien had a faithful disciple in Raoul de Houdenc whose *Meraugis de Portsleguez* (*c.* 1300–10) reflects Chrétien's taste for love casuistry, rhetorical adornment, and fantastic adventures, but lacks his genius. The other Arthurian verse-romances of the period 1170–1250 are adventure romances (*romans d'aventures*) exploiting the element of the strange, the supernatural, and the magical in Chrétien and in Arthurian tradition. A number of them (*e.g.*, *La Mule sans Frein*, *c.* 1200; and *L'âtre périlleux*, *c.* 1250) have Gawain as hero; the *Beaus Desconeus* (*c.* 1190) of Renaut de Beaujeu is a complicated adventure romance, the main episode of which relates how the hero breaks the spell binding Esmarée, who has been transformed into a serpent, by kissing her on the lips. He finally marries her.

Other Themes.—Many romances, although varied in their setting, are built round the theme of separation and reunion. The Latin romance of Apollonius of Tyre (*q.v.*) may be responsible for the popularity of the theme in the Middle Ages, although the legend of St. Eustace (the Roman general under Trajan who was miraculously converted to Christianity, lost his property, saw his wife and children carried off, worked as a journeyman, but was finally restored to his former position and reunited with his family), was also influential. There are versions of Apollonius in Old English, Spanish, and Italian, and a fragmentary version in 12th-century French. Its central theme is preserved in Shakespeare's *Pericles:* and the French epic *Jourdain de Blaives* (*c.* 1200), in which the hero loses and recovers his foster parents, his wife, and his daughter, is a free imitation of it. *Guillaume d'Angleterre,* reputedly by Chrétien de Troyes, in which the hero abandons his throne, loses his wife and twin children, only to be finally reunited with his family and restored to his kingdom, on the other hand, is a clear imitation of the Eustace legend.

Another common narrative pattern is that of the persecuted child, who escapes to another country, where he falls in love with, and marries, the king's daughter, and after many adventures, regains his lost inheritance. This is the theme of the French epic *Beuve d'Hantone* (*Bevis of Southampton*), of which there are four early 13th-century versions; and, with variations, of two Anglo-Norman works, the *Lai d'Haveloc* (*c.* 1150) and the romance of *Horn* (*c.* 1180). The *Protesilaus* (*c.* 1180) of Hue de Rotelande, another Anglo-Norman writer, is on similar lines, except that the scene is set in classical antiquity and Protesilaus is driven from his country as a result of a quarrel with his brother. *Huon de Bordeaux* (*q.v.; c.* 1220), technically an epic written in dodecasyllabic *laisses,* is a variant of this theme.

A number of romances are entirely love-romances built round the theme of the separation and reunion of two young people. The enormously popular *Floire et Blanchefleur* (before 1170; *see* AUCASSIN ET NICOLETTE), which was translated into Middle High German, Middle Dutch, Norse, and English, is a gracious and tender story in which the heroine is sold to merchants who take her away to Babylon, where she is put in the sultan's harem. She is rescued by the hero, Floire, who manages to enter the harem hidden in a basket of flowers. A second, cruder version of the romance (before 1200) was adapted by Boccaccio in his *Filocolo* (*c.* 1336). In *Escoufle* (*c.* 1200) by Jean Renart (*q.v.*), Guillaume and Aelis flee away together and are separated when the hero goes in pursuit of a kite that has seized the ring Aelis has given him. In *Guillaume de Palerne* (*c.* 1200), the theme is the successful flight of two lovers: the hero, the son of the king of Apulia, is carried away as a child by a werewolf and later flees with the daughter of the emperor of Rome: the werewolf helps them in their flight, and the hero becomes king of Apulia and later emperor of Rome, while the werewolf, who proves to be the son of the king of Spain, marries the hero's sister. *Partonopeus de Blois* (*q.v.;* last quarter of the 12th century) resembles the Amor and Psyche story in the *Golden Ass* of Apuleius (*q.v.*), although there is probably no direct connection. In *Galeran de Bretagne* (early 13th century), Galeran loves Fresne, a foundling brought up in a convent; the correspondence between the two is discovered and Fresne is sent away, but appears in Galeran's land just in time to prevent him from marrying Fleurie, her twin sister.

The essentially courtly theme of a knight who undertakes adventures to prove to his lady that he is worthy of her love is represented by the *Ipomedon* (1174–90), of Hue de Rotelande; and by the mid-13th-century Anglo-Norman *Gui de Warewic,* although this has a second, clerical part, in which Gui renounces his wife and turns hermit.

Another group of romances exploit the "Cymbeline" theme: a man has a wager with another that he will seduce the latter's wife or sweetheart and bring him proof that he has done so, but the proof is obtained by deceit and the lady's chastity is ultimately vindicated. *Le Comte de Poitiers* (*c.* 1180) is the oldest of this group, but *Guillaume de Dôle* (*c.* 1200) by Jean Renart is the most noteworthy: here, the villain misrepresents himself as an emissary of the emperor, goes to Dôle and learns of a birthmark like a rose on the lady's thigh, and uses the knowledge to slander

her chastity. The *Roman de la Violette* (after 1225), by Gerbert de Montreuil, in which the birthmark is a violet, is a close imitation of *Guillaume de Dôle.*

La Manekine (*c.* 1270), of Philippe de Rémi de Beaumanoir (*q.v.*), is based on the so-called "Constance" theme (later exemplified in Chaucer's *Man of Law's Tale*), in which the heroine is the object of unnatural love on the part of her own father and flees to a foreign land where she marries the ruler, but during the latter's absence is banished because her stepmother accuses her of giving birth to monstrous offspring, and after many adventures is reunited with her husband. The theme recurs in the *Contesse d'Anjou* (1316), by Jean Maillart. *Athis and Prophilias* (late 12th century) is built on the theme of the "two faithful friends": Athis gives his newly wed bride to Prophilias, who is dying of love for her; later Prophilias repays the debt by confessing to a murder he has not committed but of which Athis is accused; Prophilias is acquitted and Athis marries his sister Gaieté. (*See* also AMIS ET AMILES.)

Very few of the verse romances are stories of adultery, although the two most celebrated love stories of the Middle Ages—the *Tristan* legend and the story of Lancelot and Guinevere (*qq.v.*)—are of this type. The only other significant examples are the *Chastelaine de Vergi* (mid-13th century), in which the heroine dies of grief because her lover reveals their secret (and adulterous) love to the duke of Burgundy, who tells it to his wife; and the *Chastelain de Couci* (late 13th century) in which the hero, dying on a crusade, orders his heart to be sent to his lady after his death: the jealous husband obtains the heart, serves it up to the lady, and she, resolving that no other meat shall profane her lips, dies of starvation and so rejoins her lover. The theme was treated in German in the late 13th century by Konrad von Würzburg (*q.v.*), in his *Herzmaere.* The long Provençal romance *Flamenca* (? 1234) treats the theme of the gay young lover and the lighthearted wife who outwit the fantastically jealous husband in an amusing way (*see* PROVENÇAL LITERATURE).

The romances are normally set in remote times and places, although the setting in most cases amounts to little more than the lavish use of exotic personal and geographical names. Often there is a confused jumble, as in Hue de Rotelande's *Protesilaus,* in which the characters have Greek names, the action takes place in Burgundy, Crete, Calabria, and Apulia, and in which Theseus is described as "king of Denmark." The "sea-coast of Bohemia" in Shakespeare's *Twelfth Night* has medieval antecedents.

One theme remains. The last, unfinished, romance of Chrétien de Troyes, *Perceval* (or *Li Contes del Graal; c.* 1180), introduces the Grail story into European literature. The key episode is that where Perceval sees the Grail vessel, the consecrated Host in which sustains the life of the Grail king's father. What Chrétien's intentions were in introducing a deeply religious motif into a story of fantastic adventure it is hard to say, but the work had important consequences for the development of romance. A Burgundian knight, Robert de Borron, produced at the turn of the century a poem dealing with the origins of the Grail, the *Joseph d'Arimathie,* to which he appended an unfinished sequel, the *Merlin* (*see* also MERLIN). Robert's apparent aim was to connect the Grail (interpreted as the vessel of the Last Supper) with the coming of a redeemer, or interpreter, in the days of King Arthur. This notion of a predestined Grail hero appearing during Arthur's reign became, in the first quarter of the 13th century, the subject of the prose "Didot" *Perceval* and the prose *Perlesvaus* (*see* also PERCEVAL; GRAIL, THE HOLY).

The Development of Prose Romances.—These works mark the beginnings of the Arthurian prose romance. Prose thereafter became the leading romance form. The first of the great prose romances, the Vulgate cyclic romance (the prose *Lancelot*), was in existence by *c.* 1230.

The Vulgate cyclic romance intertwines the themes of romantic love, of the advent of the Grail knight Galahad (made into an analogue of the Redeemer), and of the downfall of Arthur's kingdom. The "pseudo-Borron" Grail romance (*c.* 1240) centres the story upon the "adventures of Logres," which begin with the striking of the Dolorous Stroke by the unlucky knight Balain and end with the healing of the maimed Grail king by Galahad. The marvelous adventures in this romance contain a good deal of what has, unkindly, been called Arthurian bric-a-brac, but some incidents have a strange and uncanny quality, and like some others on the Grail theme (*e.g.,* the *Perlesvaus*), the work offers a curious mingling of religion and romance, without its being clear which of the two is in the service of the other. The plot imitates the story of the Fall and Redemption: whether this means that it is a religious allegory or whether the religious theme is used to give a vaguely pious and edifying character to a purely fanciful production, is difficult to say.

No such problem arises in connection with the prose romance of Tristan (*Tristan de Leonois*). Based on the 12th-century verse romances of Tristan, it relates the story of the star-crossed lovers of Cornwall, but this basic theme is overlaid by chivalric episodes in which Tristan proves his valour; the "interlacing" structure of the earlier romances breaks down, the story becomes a string of adventures often told for their own sake, accounts of tournaments are intercalated to satisfy a contemporary interest in this pastime, digressions are frequent, and some of these form short autonomous tales connected only tenuously with the main romance. The work was enormously influential in the later Middle Ages: an early offshoot (before 1250) was the romance of *Palamède,* which exists in several versions and deals with Palamède, the Saracen who was Tristan's rival in love, and the older generation of King Arthur's knights. A collection of rambling adventures, it foreshadows the inconsequent and trivial "romances of chivalry" of a later period. The vogue of second-rate prose romances, from the 14th century onward, when the verse romances of the early period were dying out, is a little difficult to explain; the development of private collections of books and the taste for handsome illuminated and well-written volumes may have had something to do with it. The Renaissance by no means put an end to the popularity of the prose romances. The prose *Tristan* circulated as a printed book and abridged modernized versions were produced.

Adaptations of French Romances.—The French verse romances were early adapted into German: the *Éneas* by Heinrich von Veldeke between 1175 and 1186; the *Tristan* by Eilhart von Oberge *c.* 1170; the *Erec* and *Yvain* by Hartmann von Aue between 1190 and 1210; the courtly Thomas version of *Tristan* by Gottfried von Strassburg, *c.* 1210; and the *Conte del Graal* (as *Parzival*) by Wolfram von Eschenbach between *c.* 1200 and 1210. Later in the century, the courtly romance had its final flowering in German in the work of Rudolf von Ems and Konrad von Würzburg, who wrote a long *Trojanerkrieg,* a romance of the Swan-Knight (*Der Schwanritter; see* LOHENGRIN), and several shorter romances on native themes. (*See* also GERMAN LITERATURE: *Middle High German Period;* and articles on writers mentioned above.)

A great number of French romances were adapted into English, sometimes very freely, between the 13th and 15th centuries. The English verse romances have a wide range of subject matter: *Otuel* (after 1300), *Roland and Vernagu* (1330–40), and *Sir Firumbras* (*c.* 1380) are based on late epics of the Charlemagne cycle; Arthurian romances are represented by *Ywain and Gawain* (early 14th century), and *Sir Percyvelle of Galles* (late 14th century), adaptations of Chrétien's *Yvain* and *Perceval* respectively; by the alliterative *Morte Arthure* of the Thornton manuscript (second half of the 14th century), an outstanding work that tells the story of Arthur's campaign against the Romans; by the stanzaic *Le Morte Arthur* (end of the 14th century), which recounts the last battle with Mordred and Arthur's death; and by the alliterative *Joseph of Arimathie* (first half of the 14th century), a translation of part of the French *Estoire del Graal.* The large number of romances with Gawain as hero, mostly crude in style and not clearly traceable to French sources, is a feature of the English Arthurian tradition. The greatest Middle English romance, *Sir Gawain and the Green Knight* (*c.* 1370), belongs to this category: the subject (the beheading game) is bizarre, but the execution is superb, combining fantasy and great descriptive power; the tone is elegant and sophisticated and the poet's purpose is to exemplify true courtesy and the integrity of perfect knight-

hood. The Thomas version of the *Tristan* poem is adapted in *Sir Tristrem* (*c.* 1330), a tail-rhyme romance with an unusual metrical form. Thomas Chestre's the *Beaus Desconeus* (second quarter of the 14th century) is a translation of the involved "adventure romance" of the same name by Renaut de Beaujeu. *Floris and Blancheflur* (*c.* 1250) translates the French romance. The Breton *lai* is represented by Thomas Chestre's *Sir Launfal* (early 14th century), which expands Marie de France's *Lanval* into a romance; and by *Sir Orfeo*, which retells the Orpheus and Eurydice story in a medieval setting: the source was probably a lost French *lai*. The Anglo-Norman biographical romances of Bevis, Horn, and Guy of Warwick reappear in *Beues of Hamtoun* (*c.* 1300), *King Horn* (*c.* 1225), *Horn Childe and Maiden Rimnild* (1330–40), and *Guy of Warwick* (after 1300). The two romances on the "Eustace" theme, *Sir Isumbras* and *Sir Eglamour of Artois*, both from the second half of the 14th century, have no ascertainable French source, and seem to have enjoyed great popularity. *Emaré*, of roughly the same date, is an adaptation of the "Constance" theme. The alliterative *William of Palerne* (*c.* 1350) is based on a French original; and there are three 14th-century versions of the French *Ipomedon* and two 15th-century versions of *Parthenope of Blois*. The *Tale of Gamelyn* (*c.* 1350) is based on native material: the hero, persecuted by his brother, eventually turns outlaw, procures the hanging of the sheriff, and makes his peace with society. *Athelston* (*c.* 1350) is a story, of native origin, of a king who begins by acting unjustly to one of his barons, is launched on a career of violence, and is finally excommunicated. (*See* also ENGLISH LITERATURE: *Early Middle English Period*, and *Poetry: The Alliterative Tradition.*)

The French romances appeared in Norway in prose translations in the reign of Haakon IV (1217–63), when the country was brought by royal policy into the main stream of western European culture. The *Tristrams Saga* (1226), a translation of the Thomas version of the *Tristan*, was undertaken for the king by Brother Robert, who also translated the *lais* of Marie de France (the *Strengleikar*). Other romances translated in this period were the *Yvain* of Chrétien de Troyes, also at the instigation of the king, and the *Erec* and the *Perceval;* and *Floire et Blanchefleur*. A translation of Geoffrey of Monmouth's *Historia*, the *Breta Sögur*, seems somewhat earlier than Haakon's reign, and there is also a "Troy book" (the *Trojumanna Saga*). This imported romantic literature also began to influence the form and content of native stories, and from the 14th century onward European tales of the most varied provenance were introduced into Scandinavia. Between 1300 and 1312 there were verse translations of *Yvain* (*Herra Iwan*) and of *Floire et Blanchefleur* in Swedish.

In Italy the French prose *Tristan* and the *Palemède* were influential, and are represented by such vernacular prose compilations as the *Tavola ritonda* and the *Tristano riccardiano*. The 13th century in Italy is, however, distinguished by *remaniements* and compilations of French epic material belonging to the Guillaume d'Orange (*q.v.*) and Charlemagne cycles (*see* CHARLEMAGNE LEGENDS), but this epic material is assimilated to the other great bodies of medieval French narrative fiction, and it is infused with the spirit of Arthurian prose romance. In the 15th century the great poems of Matteo Boiardo and Ludovico Ariosto (*qq.v.*)—*Orlando innamorato* and *Orlando furioso*—are based on this fusion. To quote A. Viscardi (in *Arthurian Literature in the Middle Ages*, p. 428) "they chose the geography and the personages of the Carolingian epic, but the adventures and idealism are those of Arthurian romance." The serious themes of the Holy Grail and the death of Arthur left no mark in Italy, and it was thus the prose *Tristan* tradition that shaped the romantic idealism of Boiardo and Ariosto: extraordinary adventures, enchantments, marvels of the stock Arthurian type, the rescue of distressed ladies, brilliant feats of arms, the whole recounted lightly and with sophisticated humour. (*See* also ITALIAN LITERATURE.)

In the Iberian peninsula romance found its inspiration in the prose *Tristan*, the *Palamède* and the pseudo-Borron romance, all of which were translated. In Spain, however, the most significant development was the appearance of a native prose romance, *Amadís de Gaula* (*q.v.*), a biographical romance which, while modeling the hero's career in its main outlines on that of Lancelot, adopts a non-Arthurian setting and freely invents its episodic content. In the form given to it by Garci Rodríguez de Montalvo (1508) it enjoyed considerable vogue and was followed by several continuations; *e.g.*, *Esplandian* (1510), of which the hero is Amadís' son; *Liduarte de Grécia* (1514) and *Amadís de Grécia* (1530), dealing with Esplandian's son and grandson respectively; and by imitations, among which are the Palmerin romances, the first of which was *Palmerin de Oliva* (1511), and the most celebrated, *Palmerin de Inglaterra*, first published in Portuguese (1544). All these works enjoyed international fame. One consequence, however, of the 16th-century revival of pastoral poetry on the classical model was the appearance of *Diana* (*c.* 1559) by Jorge Montemayor (*q.v.*), the first true pastoral romance. (*See* also PASTORAL.) It was in England, however, on the eve of the Tudor age, that late Arthurian prose romance found its great representative. For the English-speaking world "Arthurian romance" attains its definitive form in the works of Sir Thomas Malory (*q.v.*), published by William Caxton in 1485 under the title of *Le Morte Darthur*.

Post-Medieval Developments.—At the beginning of the 17th century, compendious sentimental romances with an adventurous, pastoral, or pseudohistorical colouring, based on the 16th-century Spanish romances, were popular throughout western Europe. In France, such representatives of the genre as *L'Astrée* of Honoré d'Urfé, *Le Grand Cypus* of Madeleine de Scudéry, and the romances of Gauthier de Costes, seigneur de La Calprenède, were popular among the *précieux* society of the *salons*. However, the neoclassical literary doctrines, with their demand for psychological realism and their insistence on the *vraisemblable*, and the cult of such grand genres as tragedy, comedy, oratory, and religious apologetic, were fatal to the continued success of romance. But, before disappearing, the romances lent the French form of their name to such productions as *Le Roman bourgeois* by Antoine Furetière (*q.v.*), and *Le Roman comique* by Paul Scarron (*q.v.*), which preserved something of the outward appearance of romance, although nothing of its spirit; and so ultimately to the genre of narrative fiction that has succeeded them in modern times. In 17th-century France romance was no longer a "noble" genre.

In England, however, the greatest literary figure in the post-Restoration period was John Milton, and, for Milton, born at the beginning of the 17th century, "romance" was still an honoured term, and Edmund Spenser (*q.v.*) was its high priest. Thus, while we find Robert Boyle (*q.v.*) inveighing (in his *Occasional Discourses*, 1666) against the gentlemen whose libraries contained nothing more substantial than "romances"—evidently of the Spanish or French variety—Milton in *Paradise Lost* could still invoke "what resounds in Fable or Romance of Uther's son."

In the early 18th century, romance was discredited as being chimerical or unreasonable, but a revival of interest in the form soon set in. The Gothic romances, of which the *Castle of Otranto* (published Dec. 1764; dated 1765) by Horace Walpole (*q.v.*) was the first, are, perhaps, less important for the history of the form than is the development of a serious antiquarian interest in the past. According to Richard Hurd (*q.v.*), in his *Letters on Chivalry and Romance* (1762), romance is not truth, but represents the free play of the imagination: a sort of delightful holiday from common sense. Hurd's justification of romance is one to which Ariosto and Chrétien de Troyes would willingly have subscribed. Hurd thus sets out an ideal of romance that is consonant with the ideas of the 18th century, but also with those of the Middle Ages. It is an ideal that, in Germany, inspired C. M. Wieland's *Oberon* (*c.* 1780), but which the later Romantic school found inadequate (*see* ROMANTICISM).

In England Hurd's principle was faithfully observed by Sir Walter Scott (*q.v.*). Romance as understood by Scott and his contemporaries was primarily a narrative form which afforded the storyteller the opportunity of achieving suspense in the midst of complex situations. But Scott himself combined the "desire to make fables" ("*die Lust zu fabulieren*," in Goethe's phrase) with an attitude to the world essentially inspired by robust common sense. After the verse romances of distinctly "Gothic" inspira-

tion, which established his popularity, he turned to the writing of prose romances which took the reader into an imaginative world peopled by rather colourless 19th-century young lovers, and by such unforgettable figures of romance as Rob Roy's wife, Redgauntlet, and Balfour of Burley. But in the best novels of Scott there is at least one character who, however quaint or eccentric, embodies the sober rationalism of 18th-century Whiggism, and whose presence puts the romantic characters sternly into place. Scott perhaps embodies the truth of the saying: "romance is the recreation of the practical man." It is also the compensating factor in the antiquary's makeup. Jonathan Oldbuck, in *The Antiquary,* pedantic scholar and excellent man of business though he was, was only one half of a real antiquary. Scott, himself a real antiquary, not only engaged in studies of early texts, but made them pleasant and enjoyable reading, and spread their popularity far beyond the English-speaking world.

BIBLIOGRAPHY.—Among older works may be mentioned Richard Hurd's *Letters on Chivalry and Romance* (1762) and Sir Walter Scott's "Essay on Romance," in the supplement to the *Encyclopædia Britannica* (1816–24). ROMANCE LANGUAGES, or Romanic languages (RL), derive their name from *Roman(ic)*—that is, "Latin" because they are modern continuations of Latin. To call them daughter languages of Latin is merely metaphoric, since no descent or new creation is involved. Neo-Latin is a satisfactory term, but the Romance languages are so different from ancient Latin that entirely new names are justified. Enumerating and classifying the many dialects of the RL requires determination of the extent to which idioms called by the same name must be similar or may differ. The "discovery" of a new Romance language such as Franco-Provençal merely expresses the scholar's conviction that a type of speech appears sufficiently distinct from others so as to deserve a name of its own. The problem of classification is simplified if language is defined as a standard literary form of speech as opposed to the numerous unwritten or uncodified dialects. In this sense, the following RL may be enumerated: (1) Italian, (2) Rumanian, (3) French, (4) Provençal, (5) Spanish, (6) Portuguese, (7) Catalan, (8) Raeto- (Rhaeto-) Romance and (9) Sardinian. Italian, with the exception of dialects north of the Apennines, and Rumanian are often classified as Eastern, the rest as Western Romance languages. Raeto-Romance and Sardinian have no single standard literary languages, Catalan is endeavouring to retain or revive one, and Provençal no longer has one. Other enumerations of RL are therefore possible, depending on the manner of counting and classifying.

In common usage, terms like French, Italian or Spanish refer to the standard languages as taught in schools. Dialects subsumed under each may well be as different from one another as are the standard languages from one another; hence, speaking of Italian or French dialects often reflects national or geographic rather than linguistic criteria.

Spoken Latin.—One generally says that the RL do not continue Classical Latin (CL) but Vulgar Latin (VL). The latter term is better avoided in this context because it is variously defined and mainly because it almost invariably refers to some kind of late, postclassical or unclassical, "bad" *written* Latin, whereas the RL are derived from the *spoken* idioms of the Latin-speaking world (the Romania). CL, like any other classical or standard language, had its roots in spoken language, but with grammatical codification came some measure of petrifaction. The continuous change in spoken Latin (SL), like all cultural change, was in part a consequence of passing time but it was more significantly conditioned by the cultural history of the speakers.

As Latin spread over former non-Latin-speaking areas (the earliest Latin was spoken only in Rome and its surroundings), the natives transferred some of their linguistic habits to the new language (the influence of the linguistic substratum), and immigration, more or less intense or durable by speakers of foreign languages brought new linguistic traits which speakers of Latin then acquired (the superstratum). The history of Italy and Romania, including such recent events as the Latinization of the Americas, serves therefore as a background and base for their linguistic history.

Since not all regions of the Romania were Romanized at the same time, they were not all exposed to the same kind of Latin; indeed the new world learned Neo-Latin, *i.e.*, French, Spanish and Portuguese. Nor were they Romanized by the same Latin dialect: one district may have learned its Latin primarily from middle-class or lower-class veterans and farmers, another from upper-class administrators, officers and merchants. Some districts were soon provided with schools and learned Latin from grammarians, others learned it merely by ear in daily intercourse.

Considering all these historic and cultural causes for linguistic variety, one cannot but believe that the entire Romania spoke throughout its history many Latin and Neo-Latin (Romance) dialects, and that the uniformity of Latin is no more than an illusion due to the identification of "Latin" with standard written CL, a view which is conducive to misunderstanding. It is true that apart from good CL there existed also all over the Romania a less classical common speech, something of an international language or *koine,* which became more un-Ciceronian with the passage of time and the political and cultural breakdown that accompanied the decline and fall of the Roman empire. But not all persons spoke this progressively worsening (from a classical viewpoint) common Latin, and it is certainly not the basis of the Romance languages. This *koine* is, however, the predominant idiom of texts coming from all over the empire. Being frequently identified as VL, it has given rise to the view that linguistic uniformity prevailed throughout the Romania until the 8th or 9th century, which suddenly, cataclysmically and catastrophically, disintegrated into the numerous Romance dialects. Linguistic development does not generally occur in this way: there is no reason to assume it did in this instance.

What are the linguist's sources of real spoken Latin, not only for postclassical and Proto-Romance (PR), but also for classical and preclassical times? Latin began to be codified in the mid-2nd century B.C. under Greek influence and with the influx of Greek literature and Greek teachers of grammar. The earlier preclassical texts available, literary and epigraphic (and they are far from abundant), represent fairly well the spoken language, much better than do later texts. With the establishment of a standard language, its use by "good" writers, and grammatical instruction for the youth of the upper classes, went a rejection of all substandard colloquial and popular usage. Henceforth no one wanted to commit the (social) error of using "bad" Latin, and deviations encountered in the extant records are mainly inadvertent. During the classical period and for some time thereafter, when fair public education was accessible to many people, such lapses tended to be few in comparison with their number in subsequent centuries, which experienced a general decline in literary standards and a relaxation of the requirements for grammatical correctness. Dialect literature and "realistic" writing are lacking in the literary records—if they ever existed. Plautus' preclassical comedies, Petronius' 1st-century novel *Satyricon* and Apuleius' 2nd-century novel *The Golden Ass* are the only examples available. Hence most information comes from the less inhibited inscriptional evidence, especially the *graffiti* (scratchings on walls), from grammarians quoting and chastizing "bad" language, from collections of "errors" such as the *Appendix Probi* (probably of the 3rd century A.D.), from glosses (interlinear or marginal explanations of difficult words in a manuscript), and, of course, from the RL themselves.

Proto-Romance.—Owing to the poor documentation and the

overpowering influence that CL exerted on all writing, it is not surprising that one cannot detect genuine local Latin dialects as forerunners of the Romance dialects, apart from a few, often inconclusive forms. But it would be shortsighted to deny their existence, just because the evidence is lacking, in an area so large and of such pre-Latin linguistic variety as the Romania, particularly since the Roman state attached no importance to the linguistic acculturation of its possessions. The absence anywhere in the Romania of dialectal texts that one could call PR rather than Latin before the 9th century, when they appear with some suddenness and differ in appearance from the Latin texts of the same localities, is due to the absence of any incentive to use what was obviously bad Latin in writing. But once it was realized that the spoken vernaculars were not really just depraved Latin but languages in their own right, and that it was useless to try to communicate in Latin either in writing or speaking with persons who knew no Latin, then these bad, rustic, vulgar dialects were eventually thought worthy of being recorded for certain purposes. All higher literary and scientific endeavour, however, remained for centuries to come the province of the prestige language, Latin. The history of the Romance dialects is the history of the linguistic emancipation of the Romania.

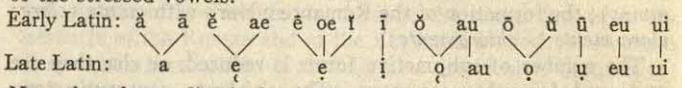
For a time, varying in length in the various regions, all dialects were of equal prestige, and the earlier Romance documents transmit fuller information on dialectal varieties than has since been available. But with the formation of national states, of cultural and intellectual centres, often coinciding with the residence of the monarch and the political capital, certain local dialects augmented their prestige and usefulness at the expense of others. The ultimate consequence was the elevation of such dialects, often just one for each nation, to the dignity of a written standard language such as CL had once been, and the relegation of the other dialects to patois of lesser importance. Thus French is essentially the language of Paris, Italian that of Florence and Spanish that of Madrid. (For details, *see* the articles on the separate languages.) The time when and the speed with which a new standard language was formed and acquired currency depend on the accompanying cultural conditions and events.

In the future, any one of the standard RL may share the fate of CL by becoming petrified and estranged from common use to such an extent as to wither away. This evolution, however, is counteracted, first, by the tendency observable during the past several centuries, and likely to continue at a mounting rate, of the acquisition of the standard language by an increasing number of persons thanks to growing literacy, improved communications and the retreat of the nonstandard dialects; and second, by the awareness on the part of modern grammarians that attempts to keep a language "pure" and immutable are merely conducive to its mummification.

This article deals mainly with those historic changes of SL which are more or less common to all Romance dialects and pertain to a stage of development called PR. (For the changes which specifically lead to their current distinctions, *see* articles on the separate languages.)

It is customary, and, in view of the scanty documentation, virtually inevitable, to compare PR with CL, rather than preceding stages of SL. But such comparison should not imply a linear development from CL to Romance. The chronological sequence (no matter how poorly attested in parts) is not Old Latin → Classical Latin → "Vulgar Latin" → Proto-Romance, but rather Old (spoken) Latin → Spoken Latin of the classical period → late spoken Latin → Proto-Romance.

Phonology.—The most important phenomenon in the vowels concerns the change from phonemic quantity to phonemic quality. Where at one time the relative length of the vowels was significant, so that two forms might be distinguished from one another solely by vocalic quantity, in PR only vocalic quality is distinctive. Since spelling was neither immediately nor consistently affected by this change, it is impossible to say when it began to operate. But it seems certain that its inception precedes the appearance of Romance documents not by decades but by centuries; its earliest traces can in fact be discerned in inscriptions of Rome's republican era. In general, long vowels become close (*uērum* > *uęrum*) and short vowels open (*bĕne* > *bęne*). (On the pronunciation of Latin spellings, *see* LATIN LANGUAGE.) Where, then, earlier Latin distinguishes two *e*-like sounds by their quantity, late SL and PR distinguish them by their quality. It may be assumed that already during the period of phonemic quantity, length was accompanied by closeness and shortness by openness of pronunciation, and that there eventually occurred a shift of distinction from one to the other of the vowel characteristics. Some diphthongs became monophthongized. The following schema illustrates the evolution of the stressed vowels.



Note that the qualitatively similar vowels, ē-ĭ and ō-ŭ, once their quantity ceases to be distinctive, coincide and have henceforth the same development in Romance, with the exception of dialects of southern Italy, Sardinia and some others. Following nasals, palatals or consonant clusters may produce various divergent developments in the different dialects.

The vowels not bearing the main stress develop somewhat differently. It is well to distinguish between final position (*murUm*), secondary stress position (*pótestÀtem*) and unstressed position (initial, *mÁritus, Altárem;* pretonic, *potEstátem;* posttonic, *pópUlum*). Among these, the pretonic and posttonic (which occur necessarily in words of more than two syllables—otherwise pretonic is impossible and posttonic is final) are weakest and tend to be syncopated early, whereas the secondary stress vowel is strongest and most likely to preserve its vowel in the original quality. The *a* is, among all vowels in these positions, the most stable. The place of the stress in PR is almost invariably the same as in earlier Latin.

While the history of the vowels is only secondarily determined by their phonetic surroundings and their stress, the consonants change primarily as a result of their surroundings (except *h* which disappears completely). Hence consonants that are different in terms of place of articulation (labial, dental, velar) often undergo changes of the same type in terms of kind of articulation (palatalization, lengthening, fricatization, loss, lenition) according to their position in the word (initial, medial, final) and their surroundings (intervocalic, in clusters, before *r* and *l*, before yod). The developments are too varied to be schematized briefly. They will be found in detail in the articles on the separate RL.

Morphology and Syntax.—In the noun, the most important change is from a three-gender and six-case to a two-gender and one-case (*i.e.*, "no case") declension. In some Romance dialects there are remnants of the cases (Rumanian, Old French, Old Provençal) in the noun, and in all dialects of the cases and of the neuter gender in the pronoun. Case and gender reductions are tied up with the phonemic changes which eliminate the final consonants, especially *s* and *m*, which are of crucial importance in the Latin inflection, and with the blurring of distinctions among final vowels, which are essential for recognizing gender and case. In the modern RL the noun gender is formally expressed by the article (formerly a Latin demonstrative pronoun) and the adjective, which must "agree" with the noun they modify. The function of the cases is fulfilled either by a more rigid word-order (*le père aime le fils:* subject-verb-object; *cf.* Latin *pater amat filium, filium amat pater, amat pater filium,* etc., all meaning the same) or by prepositional phrases (*filio: au fils; filii: del figlio*). The Romance constructions are neither more "logical" or "natural," nor less efficient than the corresponding Latin ones. They are merely different.

In the verb, the RL dropped a number of forms (future perfect, except Rumanian, Spanish and Portuguese, but with new meanings; imperfect subjunctive, except in Sardinian; pluperfect, except in Spanish, Portuguese; perfect subjunctive); they created a number of new compound tense forms (mainly of the past, indicative and subjunctive); they replaced the future by a new composition of infinitive plus *habere,* less frequently *uelle* (Rum.) or *debere* (Sard.)—*cf.* Eng. "I will," "I shall"—which has, however,

now lost all appearance of compoundness in most dialects (*amare habeo* > *j'aimerai, amerò,* etc.).

This type of replacement of Latin simple (synthetic) by Romance compounded (analytic) locutions pervades the entire morphology. It shows itself also in the substitution of prepositional phrases for case-forms; in the entire reformation of the passive voice (participle plus form of *esse; amatur: il est aimé*), which causes the disappearance of deponent verbs; the use of *plus* or *magis* in the comparison of adjectives instead of suffixes (*grandis, grandior: grand, plus grand, mas grande;* the retained Latin comparatives are few: *melius* > *mieux, meglio; peius* > *pis; minus* > *moins*); the formation of the Romance adverb with *mente* (*clare: clara mente* > *chiaramente*).

The number of subjunctive forms is reduced, or else they are employed for other purposes. The elaborate *consecutio temporum,* the rule on the sequence of tenses, is abolished. In general, the use of subjunctives is strongly reduced, a development which still continues, especially in colloquial use. Almost all Romance dialects have so-called conditionals, which are employed for expressing conditions contrary to fact and in the main clause of conditional constructions, with the *if*-clause following various rules (*s'il pouvait, il le ferait; se potesse, lo farebbe*).

Vocabulary.—Most areas of the Romania had been thoroughly Latinized in vocabulary so that relatively few pre-Latin (Celtic, Oscan, Umbrian, Etruscan, Greek) words were retained. Similarly, linguistic superstrata in the Romania (Germanic, Arabic, Slavonic), while leaving stronger traces than the substrata, account for a small percentage of Romance vocabulary. The number depends on the political and cultural history of each region: it is greater in Rumania where the superstratum is Slavonic, for example, than in Italy where it is Germanic. The later a word is borrowed into the RL, the fewer historic changes it undergoes. This is especially true of "learned" words of Latin and Greek origin which were taken into the languages during the Renaissance and subsequent centuries, down to the present when scientists coin many of their terms from Latin or Greek roots. Any foreign word becomes, after a while, a less foreign loanword, and old enough loanwords may appear so native that they are often recognized as not such only when linguistically analyzed.

ROMAN DE LA ROSE, one of the most popular French poems of the later Middle Ages; a work of over 21,000 lines surviving in more than 300 manuscripts. Nothing is known of the author of the first 4,058 lines except his name, Guillaume de Lorris (a village near Orléans). This part of the poem, composed about 1240 or slightly earlier, is a charming account, in allegorical form, of the wooing of a maiden, symbolized by a rosebud, within the bounds of a garden representing courtly society. The lover himself is not allegorized, and some of the other characters only faultily (*e.g.,* Amis, who is simply a guide and companion, rather than the representative of friendship), but most of the actors are personifications of various aspects of the loved one's mind, especially Bel-Accueil (that which inclines her to favour the lover) and Dangier (its opposite: Aloofness). On the outside of the garden are figures portraying all that is excluded from courtly life (Vilanie, Avarice, Envie, etc.). The lover is admitted into the garden, whose Lord is Deduit (Pleasure—since courtly life is one of pleasure), by Oiseuse (Indolence—courtly life is not for busy people), is wounded by the arrows of Amor (Biauté, Simplece, Cortoisie, etc.), and receives detailed instruction in the symptoms of love and the correct behaviour of a courtly lover. Bel-Accueil leads him to the rosebush, but he is prevented from picking the rose by Dangier, Male Bouche (Calumny), and Honte (Shame, *i.e.,* Modesty). Jalousie imprisons Bel-Accueil in a tower in the middle of the garden. Opinions differ about the intended end to the story—the lover appears to be overcoming the obstacles in his path, but the strict rules of courtly love would forbid his succeeding in obtaining his desire.

A 78-line anonymous termination exists, of small literary value, but no satisfactory conclusion was written until about 1280, when Jean de Meun (*q.v.*) seized upon the plot of Guillaume de Lorris as a means of conveying a vast mass of encyclopaedic information and opinions on every topic likely to interest his contemporaries. The allegory was for him of little importance, although the lover does eventually obtain the rose, and the story is frequently held up for thousands of lines while the characters discourse at length—the so-called Confession of Nature (one of the most important characters in the second part, frequently acting as a mouthpiece for Jean's own views) lasts from verse 16,729 to verse 19,400, and touches no point relevant to the original theme. Nevertheless it was these digressions that secured the poem its fame and success, for, unlike Guillaume de Lorris, Jean de Meun was writing in them for a taste that was gaining ground and not for one that was dying. His views were often bitterly contested, but they never failed to hold the attention of the age. *See* also Courtly Love.

Bibliography.—The great edition by E. Langlois, for the Société des Anciens Textes Français (1914–24), replaced all others. *See* also Langlois' *Origines et sources du Roman de la Rose* (1890) and *Les MSS du Roman de la Rose* (1911); G. Paré, *Le Roman de la Rose et la scolastique courtoise* (1941); Alan M. F. Gunn, *The Mirror of Love* (1952); C. S. Lewis, *Allegory of Love* (1936).

A Middle English version, of which the first 1,705 lines are by Geoffrey Chaucer (*q.v.*), covers all Guillaume de Lorris and 3,000 lines of Jean de Meun. There are translations into modern English by F. S. Ellis (1900) and into modern French by A. Mary (1928 and 1949). (G. Me.)

ROMAN DE LA VIOLETTE, a romance (1227–29) by Gerbert de Montreuil, dedicated to Marie of Ponthieu, wife of Simon, count of Dammartin. In the romance Gerart of Nevers stakes his domains on the fidelity of his mistress, Euriaut. Lisiart of Forez contrives to see Euriaut bathing and uses his knowledge, thus acquired, of her violet-shaped birthmark to convince Gerart of her faithlessness and claim the wager. Gerart abandons his mistress but later discovers Lisiart's treachery and, after many adventures, kills him and marries Euriaut.

Derived from the *Comte de Poitiers* (*c.* 1180) and the *Roman de la Rose* (*c.* 1200), this poem, like the latter, is interspersed with lyrics. The same theme, found in the *Decameron* (II, 9), underlies Shakespeare's *Cymbeline;* a 15th-century prose version inspired Wilhelmine de Chézy's libretto for Weber's opera, *Euryanthe* (1823).

See editions by D. L. Buffum, Société des Anciens Textes Français (1928) and (prose version) L. F. H. Lowe (1928).

ROMAN-DUTCH LAW, the system of law which existed in the Netherlands province of Holland from the 15th to the 19th century. This system, introduced by the Dutch into their colonies, was retained in those that passed to the British crown at the end of the 18th and the beginning of the 19th century; *i.e.,* the maritime districts of Ceylon, the Cape of Good Hope, and the settlements on the coast of South America now comprised in British Guiana. In a secondary sense, therefore, Roman-Dutch law is the original common law of these countries. In Ceylon it was extended to the Kandyan provinces (annexed by Britain in 1815); while in South Africa it was carried, with the expanding range of white settlement during the 19th century, into the Republics of the Transvaal and the Orange Free State and into the British colony of Natal.

Today, Roman-Dutch law is in force throughout the Republic of South Africa and the mandated territory of South West Africa; in Lesotho (formerly Basutoland); in the self-governing colony of Southern Rhodesia; and in the protectorates of Swaziland and Bechuanaland. In Ceylon it is present to a lesser degree and in British Guiana it was from 1917 largely superseded by the common law of England. Reservation is made in favour of indigenous law and custom, so far as these are recognized; moreover the general law of these countries has in many respects departed from its original type.

Development of Roman-Dutch Law in the Netherlands.—In the 15th and 16th centuries the Roman law, as interpreted by the glossators and postglossators (*see* GLOSSATORS, LEGAL), was "received" in the province of Holland (as it was sooner or later in the Netherlands generally, as well as in Germany), although general and local customs held their ground. These were based ultimately on Germanic tribal law—Frankish, Frisian, Saxon—afforced by privileges and by-laws (*keuren*) (*see* GERMANIC LAWS, EARLY), and were themselves affected by an earlier infiltration of Roman law. Hence resulted the mixed system, for which Simon van Leeuwen in 1652 invented the term "Roman-Dutch law," which remained in force in the Netherlands until superseded in 1809 by the Code Napoléon, which in its turn in 1838 gave place to the Dutch civil code now in effect. The old law was abrogated in the Dutch colonies also.

There is, however, a third element in the Roman-Dutch system, namely the legislative acts of the Burgundian and Spanish periods, the chief of which were passed during the 16th century. The large quantity of legislation in the 17th and 18th centuries had little effect upon the general character of the legal system. Roman-Dutch law can also be studied in collections of decided cases and of opinions (commonly termed *consultatien* or *advijsen*) and in a rich juristic literature.

Systematization of the Law.—The first attempt to reduce the Roman-Dutch civil law to system was made by Hugo Grotius (*q.v.*) in his *Introduction to the Jurisprudence of Holland,* written while he was in prison in 1619–20 and published in 1631 (English translation 1926–36). This short treatise, a masterpiece of condensed exposition, remains a legal classic. Next after Grotius comes Johannes Voet, professor at Utrecht and Leiden, whose *Commentary on the Pandects* (1698–1704; English translation 1955–58) is still used more than any work of the old law. Another 17th-century work of high merit and authority is Simon van Groenewegen van der Made's *Treatise on Roman Laws Abrogated and not in Force in Holland . . .* (1649; English translation of part of the work, 1908), in which the author goes through the Roman *Corpus juris* by book and title and considers how far it has been received or disused in Holland. (*See* ROMAN LAW.)

Toward the end of the 18th century Dionysius Godefridus van der Keessel, professor at Leiden, lectured on the *jus hodiernum* ("law of today"), of which he published a summary in *Select Theses on the Laws of Holland and Zeeland . . .* (1800; English translation 1855). The lectures, commonly known as the *Dictata,* still circulate in manuscript copies and have been cited in judgments of the South African courts. A younger contemporary of Van der Keessel, Joannes van der Linden, wrote a popular textbook, *Legal, Practical and Mercantile Manual* (1806; Eng. trans. of 2nd ed., 1922).

Survival and Growth Abroad of Roman-Dutch Law.—The law of the province of Holland was followed in the colonial empire, to which the Roman-Dutch system of law was extended. It was supplemented by local ordinances of the governors in council and, in the East Indies, by laws of the governors-general established at Batavia (Jakarta), in Java. The ultimate legislative authority in the colonies was vested in the states-general.

After the colonies passed to the British crown the old law underwent profound modifications, owing partly to changed social and economic conditions and partly to the incursion of rules and institutions derived from English law (*q.v.*).

The influence of English law (which was operative even during the period of the Transvaal and Orange Free State republics) has been most marked in criminal law and procedure, civil procedure, evidence, and constitutional law; and particularly in the commercial field of companies, bills of exchange, maritime law, and insurance. The law of tort or delict has also been considerably affected by English doctrines. On the other hand, the law relating to property, persons, succession, and, to a lesser extent, contract still preserve their predominantly Roman-Dutch character. It is, for example, settled for both South Africa and Ceylon that "consideration" is not necessary for the validity of a contract.

The South Africa Act, 1909, provided for the continuance of all laws in force in the several colonies at the establishment of the Union until repealed by the Union Parliament or by the provincial councils within the sphere assigned to them. But thereafter, the Union Parliament and the appellate division of the Supreme Court of South Africa were active in consolidating, amending, and explaining the law, and in making it more uniform. Many of the rules of the old law were pronounced obsolete by disuse.

In many departments of Roman-Dutch law the texts of the *Corpus juris* are still cited as authoritative, and the approach to them is still through the writings of Grotius, Van Leeuwen, Voet, Groenewegen, Van der Keessel, Van der Linden, and the rest.

A system of law which can draw at the same time upon the treasures of the Roman and of the English law has great elements of strength, particularly in a virile and progressive community; nevertheless, the need to resort to law books of bygone centuries is a serious inconvenience. Suggestions for codification have been put forward, but the weight of professional and academic opinion is adverse. *See* also SOUTH AFRICA, REPUBLIC OF.

(R. W. L.; D. V. CN.)

ROMANES, GEORGE JOHN (1848–1894), British biologist best known for his popular writings on evolution, was born at Kingston, Ont., on May 20, 1848. Educated at Gonville and Caius college, Cambridge, he at first wished to be a clergyman, but finally specialized in natural science. He began his researches with the study of jellyfish, starfish and sea urchins, but soon enlarged them to include broader problems of biology, and especially the development of intelligence. His *Mental Evolution in Man* (1888) maintained the essential similarity of the reasoning processes in the higher animals and in man. In 1893 he brought out the first part of *Darwin and After Darwin,* the last, unpublished portion of which contained much controversial material on physiological selection. Romanes never lost interest in religious ideas, however; at intervals throughout his life he published essays indicative of his changes of view from Protestant orthodoxy to agnosticism, and through monism back to orthodoxy again. In 1891 he founded at Oxford the Romanes lecture, to be delivered annually on a subject in science, art or literature. He died at Oxford on May 23, 1894.

ROMANESQUE ARCHITECTURE was the style of architecture of western Christendom from the 8th to the 12th century. It was a round-arched style (*i.e.,* Roman architecture with a difference). A preliminary phase marked by very interesting monuments in the northern region, in Italy, in France and in Spain, occurred during the Carolingian period (roughly from 775 to 950). The Romanesque is usually considered to have had its more definitive formative period between 950 and 1050, and it produced its greatest achievements in the High Romanesque period during the century that followed. French Romanesque entered a florid or baroque phase about 1120; then, beginning about 1145, Romanesque receded before the French Gothic style, but buildings in a tardy Romanesque style continued to be constructed even in the 13th century. The style was revived in the early 19th century, and is in occasional, though diminishing, use.

For a discussion of the architecture of the periods preceding the Romanesque, *see* ROMAN ARCHITECTURE and BYZANTINE ARCHITECTURE; the periods following the Romanesque are treated in GOTHIC ARCHITECTURE and RENAISSANCE ARCHITECTURE. *See* also ARCHITECTURE.

CAROLINGIAN (775–950)

The monasteries, particularly those that followed the Rule of St. Benedict (Monte Cassino, 529), were peaceful islands devoted to prayer, the arts and good husbandry in the welter of confusion and local war that followed the collapse of the western Roman empire in 476. Just as Constantine recognized in the church the means of revitalizing the late empire, so Charlemagne recognized the potentialities of the monastic system and reinforced it by legislation. With the economic revival of Europe depending on them, the more important monasteries became imposing corporations with extensive mundane as well as spiritual powers. They controlled and managed considerable areas, and their establishments—intellectual, artistic, industrial, agricultural, judicial and administrative centres—were the training ground for ecclesiastical and governmental officials. The inevitable corollary was that monastic architecture became the most important type of living architecture. Cathedral architecture was in general less ambitious, and dependent on monastic developments at this time.

Though the ideals of the monastic institute were Roman, Roman architectural uniformity was no longer possible. With communications difficult, localism necessarily flourished, and moreover the Carolingian revival was fecund in ideas and full of fresh energy. Tastes were different. There was no longer a preference for self-consistent, serene and classic design, which it was impossible to exemplify in the chief architectural problem of the age, the highly articulated monastic church.

In the old cities, Roman and early Christian architecture lived on in a somewhat degenerate form. For ordinary work simple Roman procedures survived, except that rubble faced with stone (or, in other cases, solid brickwork) replaced concrete. Modest works, both urban and rural, employed half timber, timber, mud and thatch, as had been the case under the Romans, but much more picturesquely than in antiquity. Very striking and vigorous silhouettes for all types of buildings in the north resulted from the abundance of wood, the wet climate and the often inferior roofing material, which called for framed roofs of steeper slope and encouraged the addition of picturesque wooden gables, dormers, pinnacles and spires. Gifted northern designers systematized these developments and gave them monumental form in monastic construction.

Charlemagne's cathedral at Aachen (Aix-la-Chapelle, *c.* 790–805) which survives (a vaulted octagon with aisles, galleries, tribune and tower) is a beautiful, but not characteristic, building of its age. Much more typical was the destroyed imperial abbey church of St. Riquier (anc. Centula, 790–799), which was the forerunner of the fully evolved medieval church. The scheme was based on the Christian Roman basilica (*q.v.*), roofed in wood. The church at Centula had an imposing façade, perhaps the first really monumental church façade, in the shape of a "westwork," consisting of a low vaulted vestibule with a chapel and galleries in the tribune, stair towers and a tall openwork spire. At the east there was a transept with stair towers and a spire at the crossing, and an elaborate arrangement of chapels beyond. The general scheme, with variations, continued in use in the Rhineland during the Romanesque period; its influence affected the Gothic, and is still felt in present-day church architecture.

A Carolingian court architect in a famous plan, dated about 822 and preserved at the Swiss monastery of St. Gall, developed the basic scheme of the Roman rustic villa for the design of a great conventual establishment to house as many as a thousand people, with their multifarious activities and supplies. This type of monastery plan was used, with appropriate changes, throughout the middle ages, and it is still normative today. The residential court of the villa became the cloister (*q.v.*) of the monastery. The typical cloister was square, with arcaded walks and a garden, and the rooms used by the monks were systematically arranged about it. Usually there were, on the east, the chapter house (*q.v.*), where the community met as a corporation, the auditorium (a business room) and the camera (a workroom), with the dormitory on the upper floor above them all. The south side normally had the calefactory (a warmed room), the ceremonial lavatory, the refectory, pantries and kitchens. On the west were ranged, as a rule, the cellars, the almonry and the porter's lodge. The vast bulk of the church was typically on the north side of the cloister. Other courts served: on the east, the infirmary; on the east or south, the novitiate; on the west, the quarters for lay brethren and wayfarers. North of the church, accommodations were provided for the abbot, for the monastic school and for visitors of mark. Gardens, yards, shops and barns were disposed logically in outer areas. In later times all these elements were enclosed within a fortified girdle wall.

The great contribution of the south during the Carolingian period was a simplified type of Roman vaulting and wall construction in rectangular brick, or more commonly, small stones, with characteristic decorative arcading and corbel tables. This spread from half-Byzantine Ravenna to Lombardy and thence to Germany, eastern France, southern France and Catalonia. The style was propagated by traveling masons called comacine masters (*i.e.*, fellow workers on the scaffold). Formed about 750, this style is called the First Romanesque, and it flourished until about 1050 (example, S. Pietro at Agliate, in Lombardy, 875). In developed form, it became the Lombard High Romanesque style.

FORMATIVE PERIOD (950–1050)

Early independent styles resembling Romanesque are called proto-Romanesque. Such styles, the Mozarabic and the Asturian, based on Roman and Muslim work, flourished in northwestern Spain from about 815 to 950 (example, Sta. María de Naranco, vaulted, 848). Contemporaneously, there was a very interesting Irish proto-Romanesque style. The Irish built elegant round towers and small churches of simple form with corbel vaulting (example, Glendalough, about 980). By the 11th century the Scandinavians had developed their remarkable wooden ("stave") churches, often in the form of tall pinnacles built about a system of masts.

Western France suffered terribly in the Carolingian period, until 911, from Norse piratical raids. Nevertheless, considerable numbers of fine churches and monasteries were built, wooden-roofed, with something of Rhenish grandeur. The First Romanesque did not penetrate there, and the use of vaulting was limited, but the designs have a real French ingenuity and elegance, and excellent ashlar masonry. At the cathedral of Clermont, dedicated 946, the ambulatory and radiating chapels about the apse (adumbrated at St. Philibert de Grandlieu, 847, and St. Martin, Tours, 918) took systematic form, and as later developed (at Tours, 997–1014, for example, and in Gothic times) became one of the most inspiring interior features of medieval church architecture. On the exteriors, the towers, pinnacles, and spires gave the churches a finely animated silhouette.

Burgundy, lying in eastern France, was in contact with the Rhenish, the Lombardo-Catalan and the west French areas. It received architectural influences from all sides, and integrated them successfully. The region became important architecturally about 950 through the development of federative monasticism. The abbey of St. Philibert at Tournus, with widely disseminated priories, built a church between 960 and 1120 in which the various elements of the Burgundian style are still perceptible, though not yet fused in synthesis, as they were to be in Cluniac and Cistercian architecture.

The monastery of Cluny, founded in 910, was the most important of the early monastic congregations. It soon became interregional and international, and ultimately had about 1,450 dependencies. The abbey's own second church (950–981) was a very interesting building, which became normative to a certain extent. It was one of the first churches to have the familiar arrangement of two western belfries and a tall crossing tower. There was a series of seven chapels at the east. The Cluniacs built substantial vaulted churches as a matter of policy beginning

Cathedral of Worms, Germany; second half of 12th–13th centuries. Small arched colonnades articulate the octagonal crossing tower

Cathedral group at Pisa, Italy; 11th–12th centuries. At left may be seen part of the baptistery. In the background is the 184-ft. (56-m.) campanile, better known as the Leaning Tower

Ely cathedral, England. Unusual west front with central tower and south transept; *c.* 1200, with Gothic additions

Saint-Philibert, Tournus, France; 960–1120. Arches span the nave from pier to pier and support the barrel vault

Pietro, Agliate, Italy; *c.* 875. An example of First Romanesque style, S. Pietro is built of small stones. The characteristic Lombard campanile of the 12th century shows the easy transition from this style to Lombard High Romanesque

about the year 1000, and the building art gained greatly by their interest in good construction. The monastery buildings which were built at Cluny betwen 990 and 1043 were widely influential all over western Europe.

There were interesting developments elsewhere in the formative period, as in the vast earlier cathedrals of Chartres (1020, 1037) and Auxerre (1025). In Catalonia a vast church in the Lombard style was built at Ripoll (1032). Huge abbey and cathedral buildings were built in Ottonian Germany, as at Speyer in the Rhineland (1030 and later). Saxon England, from about 950 to 1050, built in a provincial version of the German Carolingian Romanesque style.

HIGH ROMANESQUE (1050–1150)

The High Romanesque style was made possible by increasing resources and greater skill in construction and decoration (both sculptured and painted). Oriental and Byzantine influences were absorbed, and many attractive regional types were worked out. High Romanesque may be said to have begun with the creation of a handsome, spacious and stable type of entirely vaulted French church that was connected with the pilgrimage to Santiago de Compostela, and consequently became interregional and international. On the pilgrimage roads there were four great French abbey churches (Tours, Conques, Limoges, St. Sernin at Toulouse), together with many smaller pilgrimage buildings. The chief shrine was at Santiago, built in 1078–1211. All five great churches had magnificent plans with ambulatories and radiating chapels, and impressive towers. There was beautiful and abundant decorative sculpture, especially at the portals and in the cloisters. These churches characteristically had the aisles covered by groin vaults, the galleries by quadrant vaults and the naves by banded barrel vaults. The churches at Conques and Toulouse survive with very little change; that at Santiago has been rebuilt on the exterior.

On a still grander scale was the masterpiece of Romanesque architecture, the third church of the abbey of Cluny (1088–1130 and later; 615 ft. long; barrel vaults of the nave 32 ft. wide and 96 ft. high to the crown, over a clerestory). This building had many features which prepared the way for Gothic: tall proportions, grouped piers, pointed arches, specialized wall and vault construction. It had a very elaborate and sophisticated modular system and characteristic carvings of great beauty in the apse (where one of the first medieval sculptural allegories was placed, 1095) and at the portals of the nave (where the first really grand ensemble of monumental carved and painted west portals was placed, about 1109–15). Further great projects of Cluny in and near Burgundy were Vézelay and La Charité-sur-Loire, where the two-towered Gothic cathedral façades with rich portals were anticipated, about 1120–25. Vézelay (1104–32) had the first wide nave with groin vaults at a high level, anticipating the ribbed groin vaults which were essential to Gothic architecture.

In Lombardy, where the First Romanesque style developed (by better construction and decoration, rather than by radical change) into Lombard High Romanesque, there were experiments with domed-up rib vaulting in square bays for the naves in the early part of the 12th century at S. Ambrogio, Milan, with two smaller vaults in the corresponding aisles of each bay. The logical "alternate system" of alternately heavy and light supports was developed.

It is generally supposed that through high-ranking ecclesiastics of Lombard origin these ideas were introduced into Normandy. Here a noble High Romanesque school, generally with unvaulted naves at first, came into being under the influence of western France and the Rhineland (Jumièges, 1040–67; Caen, 1062 and 1068). (*See* NORMAN STYLE.) It was carried to England; William the Conqueror founded magnificent and powerful Benedictine abbeys after 1066 as instruments of royal policy. All of them built nobly and well; one of them, the cathedral abbey of Durham, built the first splendid great church which was entirely vaulted with heavy ribbed groin vaults (1093–1133).

The innovation was adopted, along with proto-Gothic suggestions from Burgundy, and was improved by the use of lighter, cleverer cut-stone work, in the creation of the first consciously Gothic design (the abbey of St. Denis, near Paris, about 1137–44). This style attracted the attention of the bishops of the entire royal domain near Paris, and quickly superseded the undistinguished local Romanesque of the Île de France. The cities underwent a spectacular growth at this time in commerce, in intellectual and civic life. The new Gothic style flourished in them and became symbolic because of this, and it ultimately superseded the Romanesque.

The last great effort of monastic Romanesque was in buildings of the austere Cistercian order, which was founded in 1098 and expanded all over Europe during the 12th century. For their churches and monastic buildings a simple, practical version of the Burgundian Romanesque style was developed, using rather rudimentary heavy Gothic vaulting, which is often called "half-Gothic." An excellent example is the abbey of Fontenay, 1139 and later. This special type of design, representing the personal preference of St. Bernard, was made obligatory. Thus, throughout western Christendom, it prepared the way for the expansion of the true Gothic of the Île de France. The Cistercians extended the use of vaulting, especially the use of repetitive square ribbed groin-vaulted bays, to the monastery quarters, though they also built these, in traditional fashion, with wooden roofs.

Because so many of the buildings in which the real history of Romanesque was written have been destroyed, it has become customary to study the style, catalogue fashion, in its various local manifestations. The designers employed local materials, and intermingled various traditions in special ways; a marvelous imaginative richness was the result. In the High Romanesque everywhere, ashlar masonry was used for the walls, often, by exception, in brick-building regions. Embellishments in paintings and sculpture were usual.

The following are the various local schools, aside from those already mentioned.

Germany.—The traditional Carolingian heritage gave form to High Romanesque buildings of the 12th century, and Germany still bears their imprint. The vast imperial cathedrals of the Rhineland (Maiñz, Worms and Speyer, now vaulted) had much Lombard detail. A special and interesting school developed in Saxony. Germanic Romanesque also spread to Hungary.

Italy.—Lombardy was an area in which the first Romanesque style was transformed into the High Romanesque, particularly because of the development of ribbed groin vaulting. Decorative arcading was used, in enriched form. Brick was widely employed in later work. Romanesque forms continued in use long after the coming of Cistercian half-Gothic. The Lombard cities built tremendous cathedrals, simple in plan, during the 12th century. A very handsome belfry tower type was developed; also, spacious baptisteries (*e.g.*, Parma cathedral).

Tuscany retained strong early Christian traditions, exemplified in the octagonal baptistery of Florence (restored in 1059) and the common use of basilican church forms. In the High Romanesque, marble was used extensively, often in panels and zebra work (example, the cathedral group at Pisa, 1063–12th century).

Central Italy was still more conservative; the early Christian style survived there with little change except degeneration. The region about Monte Cassino was more inventive; the famous abbey built the typical church of the region, basilican in form (1066–71). It is believed that Muslim pointed arches entered the European church building tradition here (in the porches), from which they spread to Cluny, and from there to the Île de France and Gothic. A school of painters developed, under Byzantine influence, which was drawn on by the Cluniacs in their work.

Norman Italy and Sicily.—Buildings which are basically Lombard, Tuscan, Muslim, Byzantine or early Christian were built as the realm became prosperous. Nuances of design, and a strange mingling of influences, give them strong local feeling. Examples are S. Nicola, Bari (1087), where St. Nicholas is buried; the cathedral of Monreale, 1174, with wonderful mosaics; S. Cataldo at Palermo, 1160, a former synagogue in the Muslim domed style.

France.—*Provence*—Romanesque architecture is here most Roman in feeling: grand, simple, spacious bulks were built, usually in fine ashlar masonry, as at Avignon cathedral, about 1140–1200, and often with fine sculpture, as at the cathedral of Arles (1150

and later) and St. Gilles du Gard (1116 and later, to about 1170).

Aquitaine.—For spaciousness, domes on pendentives of special form (often four in line as at Angoulême cathedral) were used. The cruciform St. Front, Périgueux, of 1120, was an exceptional building, spoiled by modern restoration.

Poitou.—Here elaborately arcaded façades formed somewhat illogical frontispieces for spacious "three-naved" churches with windowed aisles almost as tall as the central windowless naves. There are beautiful paintings (*e.g.*, St. Savin-sur-Gartempe). This region has several fine Romanesque castles, in the usual form (as at Loches, about 1100) of a great square tower, the donjon or keep, with guard and residential rooms on several levels, and appropriate outworks.

Languedoc.—The churches here have bold massing and beautiful sculpture, the tradition of which goes back to the formative period (St. Genis des Fontaines, 1020). St. Sernin at Toulouse (about 1080 to 1200) is in the Pilgrimage style, and many churches are related to it.

Auvergne.—A long tradition (Clermont cathedral, 946) developed here, more or less in the manner of the pilgrimage churches. The high "lantern transepts" are characteristic (*e.g.*, Notre Dame at Clermont-Ferrand, 1150). The cathedral of Le Puy (11th and 12th centuries), with zebra work in the masonry and a file of domes, represents reflex influence from Spain: Muslim motifs were brought in via the pilgrimage road. Such influence is perceptible also in Burgundy, and perhaps in the west of France.

England.—The vast effort of the Norman Benedictines endowed England with magnificent works which still maintain their Romanesque dignity in spite of many later additions, particularly Gothic vaulting, towers and chapels. The grandest examples, like Durham, Ely and Norwich, have aisles and galleries flanking impressively long naves. Caen stone was imported for much of this work.

Iberia.—*Northern Spain and Portugal* were expanding through the reconquest in Romanesque times. The architecture clearly testifies to the great influx of men and ideas, particularly from Burgundy, Poitou and Languedoc (as at Santiago cathedral). Cistercian half-Gothic became important (example, Poblet, 1180–96). *Catalonia* long remained faithful to the Lombard style. Everywhere there are Muslim reminiscences, sometimes obvious, sometimes very subtle. The walls of Avila (1090 and later) are among the finest of Romanesque military constructions. The Exchange at Lérida (after 1200) still has its medieval façade, with a characteristic upper window arcade. Bragança in Portugal has a more or less contemporary municipal hall, also with a clerestory arcade.

Palestine.—The Crusaders built extensively in the Latin kingdom of Jerusalem. The buildings are south French or Burgundian Romanesque, or Burgundian half-Gothic in style (*e.g.*, new constructions at the Church of the Holy Sepulchre, 1099–1147; the present mosque of Beirut, late 12th century). Many remarkable castles were built before and after 1200, incorporating Byzantine and Muslim innovations in military architecture; by reflex this work influenced the west.

A representative Romanesque imperial palace is the Pfalz at Goslar, in south Germany (1050, rebuilt after 1132, and later). The Wartburg near Eisenach (about 1200, celebrated in *Tannhäuser*) is the best-preserved Romanesque dwelling. The plan is simple, with the main rooms on the upper floor and lighted by window arcades. Smaller houses (as at Cluny, 1159, and at Lincoln) are like excerpts of such a building.

ROMANESQUE ART is the term applied to the art prevalent in western Europe prior to the Gothic and distinguished from the parallel Byzantine art (*q.v.*) of eastern Europe. As medieval archaeology has shed light on the centuries of the so-called Dark Ages from the fall of Rome to the crusades, the scope of the term Romanesque has gradually contracted until it is generally understood to cover the period from A.D. 1000 to 1150. The style, however, cannot be understood unless the developments of the preceding centuries are taken into account.

Prior to the florescence of the Romanesque, the Early Christian

style may be distinguished; it emanated from Rome, included the art of the catacombs and the imperial basilicas built there under Constantine the Great, and concluded with the art of Ravenna through the last days of the Western empire and Theodoric's Ostrogothic kingdom. Constantine abandoned Rome and re-established his capital at Byzantium around A.D. 328, thereby establishing the bases for the separate but interrelated styles of eastern and western Europe—the Byzantine and Romanesque.

The Romanesque style followed the spread of Christianity; in this style the western Roman tradition and eastern Byzantine influences merged with the energetic, muscular paganism of the peoples of the north, whose imagination was unhampered by the classical heritage. Various historians, sometimes slanted by nationalistic considerations, have distinguished, among others, proto-Romanesque styles such as a Frankish Merovingian period (486–751) in France, a Carolingian period coincident with the reign of Charlemagne (771–814), an Ottonian period (*c.* 912–1024) in Germany, and a pre-Norman period in Britain before the conquest of 1066. Before the Romanesque could achieve full definition and maturity, it had to undergo a long period of consolidation after the disintegration of Roman power, the period of the great migrations, and the successive invasions of Europe by the Saracens from the south, the Hungarians from the east, and the Vikings from the north. The mature Romanesque consequently bears the imprint of all these events and may properly be characterized as an interplay of Roman, Byzantine, Saracenic and northern Barbarian elements.

Surviving examples of the migratory period are found in the designs of buckles, brooches, decorated dagger sheaths and the like. From Irish monasteries of the 6th through the 9th centuries there are monumental stone crosses carved in bold relief, curious tapering round towers, and manuscript illuminations characterized by fantastic animal forms and by interlaced designs of extraordinary complexity. In Britain a few remnants of architecture prior to the Conquest exist, such as the Saxon tower at Earl's Barton, and the small Church of St. Laurance at Bradford-on-Avon.

Because of feudalistic rivalries and unsettled conditions generally, Romanesque art developed in the rural strongholds of the monastery and castle rather than in urban centres. Furthermore, since monasteries were less apt to be subjected to fire and sword than castles, the surviving examples are mainly monastic. The relative isolation of abbeys and priories, from Scotland to north Africa, and from Portugal to Jerusalem, accounts for the peculiarly diffused and diverse character of the style. This decentralization also helped make the Romanesque one of the most inventive, original and inspired periods in the history of art.

Surviving examples of Romanesque secular art are conspicuous by their rarity. The most important secular pictorial work of the period is the Bayeux tapestry (*q.v.*) in which the battle of Hastings is recounted in 72 scenes. Stitched in eight colours of wool on a linen strip about 20 in. wide and 231 ft. long, the designer tells his story with boldly delineated figures and straightforward simplicity. Probably commissioned for the Bayeux cathedral, it nevertheless is modeled after the type of mural paintings and textile wall hangings that adorned the great halls of castles.

With Romanesque architecture (*q.v.*) came the revival of monumental sculpture, a dormant art since late Roman days. In such French abbey churches as Vézelay, Autun and Moissac, large compositions depicting Christ in Majesty and the Last Judgment are found over the portals of the façade and narthex entrances. Such compositions reveal a jumble of large and small figures with no regard to natural proportion or scale. Distortions of the human figure occur partly for expressive purposes and because the sculptor had to fill the allotted surface space. In the interiors of such churches and adjoining cloisters, capitals of columns were carved with the greatest variety of figures and foliated forms. Romanesque painting exists in the extremes of delicate miniature illuminations and monumental murals on vaulted surfaces. The most striking examples of such large-scale frescoes are usually found on the semidomed apse vaults.

Romanesque art also included the sacred vessels used in the liturgy, ivory and gem-studded book covers, embroidered vestments and altar cloths, candelabra of burnished bronze, carved choir stalls and other embellishments. Since reverence for relics played such an important role in the pilgrimage movement, Romanesque reliquaries are objects of special interest. "Men's eyes are set under a spell by reliquaries," observed Abbot Suger of St. Denis. "They see the shining image of a saint and in the imagination of the people his saintliness is proportioned to its brilliance." Such sacred remains were enclosed in statues of gilded wood or polychromed stone, as well as in portable altars and caskets fashioned to resemble miniature churches and other forms. Such work was executed in copper and gilt, chased with low-relief designs and often encrusted with precious gems.

I. THE MONARCHY AND THE REPUBLIC

A. The Beginnings of Rome

1. The Formation of Roman Historiography.—The first Roman historians (Q. Fabius Pictor, Cincius Alimentus) lived in the late 3rd century B.C. and wrote in Greek. A Roman historiography in Latin developed later, in the 2nd and 1st centuries B.C. (beginning with M. Porcius Cato the Censor). Only short fragments of these early historians are preserved, and it is not known exactly how they proceeded to collect information about the past of Rome. Some idea of their method can, however, be formed from the sections of Diodorus Siculus' *Bibliotheca* that deal with Roman history, and from the surviving books of Livy and Dio-

nysius of Halicarnassus. Diodorus (1st century B.C.) probably used Roman historians of the 2nd century; whereas Livy and Dionysius, who lived under Augustus, seem to have relied mainly on Roman historians of the 1st century B.C. For events earlier than the First Punic War Roman historians were able to draw on: (1) a pontifical chronicle (*Annales pontificum*) which apparently concentrated on events with religious implications (such as famines and eclipses); (2) traditions of individual aristocratic families (including inscriptions, written funeral speeches, oral recollections); (3) official lists of magistrates which certainly existed from about 509 B.C. onward; (4) other documents, such as religious calendars, texts of treaties, laws (*e.g.*, the Twelve Tables).

The Romans seem to have had primitive epic poems and banquet songs in honour of great men; but Cato alluded to the banquet songs as a feature which had disappeared from Rome long before his time (2nd century B.C.). They are unlikely to have contributed much to the Roman historical tradition, though authoritative modern historians (B. G. Niebuhr, G. De Sanctis) have held the opposite view. Roman events were certainly mentioned in Etruscan and Greek historical books. It is not known whether the Romans of the republican period made use of Etruscan historical books (the emperor Claudius seems to have done so), but they read what the Greeks wrote about Rome. The references to Rome which they found in Greek historians of the 5th and 4th centuries (such as Hellanicus and Theopompus) were, however, confined to the origins of Rome or to a few events of international importance of later times—for instance the occupation of Rome by the Gauls. The first Greek historian who wrote extensively about Rome, Timaeus of Tauromenium, lived only one generation before Fabius Pictor and was chiefly concerned with Pyrrhus' war, with which he was contemporary.

On the basis of the scanty evidence available it was difficult to write the history of Rome before the First Punic War. Critical skill in questions of authenticity and interpretation and scholarly detachment were needed to use it properly. Neither was to be expected. The majority of the Roman historians (at least in the 2nd and 1st centuries B.C.) were no scholars; they belonged to the senatorial class and were directly involved in political struggles. It is therefore not surprising that they wrote the history of the first five centuries of their city in an uncritical manner and that even their accounts of later events were often distorted for partisan purposes.

The ancient tales about early Rome were accepted at their face value until the Dutchman J. Perizonius (1685) and the Frenchman L. de Beaufort (1738) questioned them. More systematic criticism of the ancient literary tradition about Rome had to wait until the 19th century, and B. G. Niebuhr can be regarded as its founder. Later T. Mommsen concentrated his critical genius on the study of the Roman constitution, which in his view had been better served by ancient tradition than had the recording of military events and political struggles. In the 20th century linguistic research and archaeological excavations gave prominence to the problems concerning the place of Rome in the complex civilization of ancient Italy: the relations between Rome and Etruria and Rome and Greece (often through Etruria) have been thoroughly examined. Linguistics, archaeology, and the history of religion provide an ever-increasing amount of evidence independent of the literary tradition. The history of Rome which has thus emerged is very different from that written by Diodorus, Livy, and Dionysius. Yet this does not entitle us to disregard the ancient literary tradition. However distorted and naïve it may appear, it contains a great deal that is sound. Even for the monarchical period it has preserved some important facts. For the republican period it has provided a good chronological framework and a substantially reliable outline of the political and military developments.

2. Literary Tradition.—According to the tradition found in Livy, Dionysius of Halicarnassus, and other Augustan writers, Rome was founded by Romulus about 750 B.C. Romulus was a descendant of the Trojan Aeneas who had founded Lavinium. Aeneas' son in his turn had founded Alba. After a long series of Alban kings lasting for 300 years, Numitor was deposed by his brother Amulius. Numitor's daughter, Rhea Silvia, was raped by the god Mars and bore him the twins Romulus and Remus. Romulus killed his brother Remus and later shared his power with Titus Tatius, king of the Sabines. He divided the Romans into three tribes and 30 *curiae*. After his death or ascension to heaven the Romans elected the Sabine Numa Pompilius, who introduced some of the fundamental Roman religious institutions. The third king (not counting Titus Tatius) was Tullus Hostilius, a good warrior who destroyed Alba Longa; the fourth was Ancus Marcius, who established a colony at Ostia. The fifth king, Tarquinius (Tarquin), was different from his predecessors; he had an Etruscan name but was really the son of the Corinthian Demaratus and an Etruscan woman. He fought Sabines and Latins, drained the Forum, and was altogether a tyrant in the grand style. He was followed by a Roman, Servius Tullius, who introduced coinage, divided the citizens into five classes according to wealth (*see* below), created the *comitia centuriata* and the local tribes, and surrounded the city with a wall. The seventh and last king was another Tarquinius, a son or grandson of the first. He undertook big public works, built the Cloaca Maxima (main drain; also attributed to the elder Tarquin), humiliated the Latins, made himself unpopular by tyrannical acts, and was finally thrown out by an aristocratic conspiracy in 510 B.C. The plotters set up a republican government presided over by two annual magistrates. They had to defend Rome against the Etruscans led by Lars Porsena of Clusium; and they inaugurated the Temple of Jupiter Capitolinus built by the Tarquinii.

MANSELL—ALINARI

CAPITOLINE WOLF

Bronze sculpture from the Capitol, dating from about 500 B.C. The twin figures of Romulus and Remus were added during the Renaissance. In the Palazzo dei Conservatori, Rome

In general outline this tradition is to be found in the earliest historian of Rome, Fabius Pictor. Some of its elements certainly go back much further. For instance, the legend about a wolf feeding Romulus and Remus was already officially accepted by 296 B.C. when the Ogulnii set up their statue celebrating the fact. On other points the early historians exercised their discretion —or their fantasy. For instance, Fabius Pictor thought that Romulus was the grandson of Numitor, but his contemporary, the poet Naevius, wrote that Romulus was the grandson of Aeneas (thus brushing aside the 12 Alban kings between Aeneas and Romulus). Even the date of the foundation of Rome remained long uncertain. Timaeus put it in 814 B.C. (and made it contemporary with the foundation of Rome's rival Carthage), Fabius Pictor chose 748, Cincius Alimentus 729–728. The so-called traditional date of 753 was made authoritative by the great antiquarian Varro in the late 1st century B.C. Even when the republican historians seem to agree among themselves they are not above suspicion. For instance, the emperor Claudius discovered a king of Rome called Mastarna whom the previous Roman historians had ignored. Rightly or wrongly, he identified Mastarna with Servius Tullius.

The same Mastarna appears in a historical scene painted in an Etruscan tomb at Vulci (variously dated 4th–2nd centuries B.C.) and has something to do with the killing of a "Roman Tarquin." Similarly, Pliny the Elder (*Natural History,* xxxiv, 139) and Tacitus (*Histories,* iii, 72) learned somewhere that Porsena had compelled Rome to surrender. This fact was conveniently ignored by earlier Roman historians.

3. Linguistic Evidence.—The inhabitants of Rome spoke the Indo-European language known as Latin. The evidence for Latin's being spoken in Rome is not earlier than the 6th century B.C., to which belong the Duenos vase and (at least according to some authorities) the *lapis niger* of the Forum with their mysterious inscriptions. It is improbable that Etruscan was at any time the language of the majority of the inhabitants of Rome. As far as is known, laws, treaties, and other official texts were always written in Latin; more particularly, the Twelve Tables composed in the middle of the 5th century were in Latin. But three 6th-century vases with Etruscan words have been found in Rome, one on the Capitol, another on the Palatine, and the third at S. Omobono; the Etruscan influence in the 6th century is thus linguistically confirmed. Even about 400 B.C. the area in which Latin was spoken was narrow: it covered about 50 sq.mi. The Romans had neighbours beyond the Tiber who spoke Etruscan, others in the direction of the Anio who spoke Sabine dialects; Volscan was spoken along the coastal plain between Latium and Campania. Words borrowed from Etruscan are few in the Latin language (almost entirely personal names and technical words). Sabine influences are more conspicuous and perhaps to be found even in domestic terms such as *lupus, bos, scrofa, popina, rufus* ("wolf," "ox," "sow," "cookshop," "red-haired"). Greek words appear early in Latin: the word *poena* ("penalty") was already to be found in the Twelve Tables. Some Greek words—especially names of mythical figures—may have come to Rome through Etruscan (*e.g.,* Hercules, Proserpina) and confirm the part played by the Etruscans as mediators between the Greek and the Roman civilization in the archaic period. (*See* also LATIN LANGUAGE; ETRUSCAN LANGUAGE; ITALIC DIALECTS.)

4. Evidence from Religious Customs.—Evidence from religious ceremonies may reflect the progressive extension of the Roman territory. Since the Luperci in the festival of the Lupercalia (*q.v.*) used to run around the Palatine, this may be evidence for the Palatine's being the earliest settlement called Rome (doubts have been expressed by A. Kirsopp Michels in *Transactions of the American Philological Association,* lxxxiv, pp. 35–59, [1953]; *cf.* however K. Latte, *Römische Religionsgeschichte,* p. 84, note 4 [1960]). Another stage of the urban development may be represented by the festival of the Septimontium, which included the three parts of the Palatine (Cermalus, Palatium, Velia), the Caelius, and the three parts of the Esquiline (Oppius, Cispius, and Fagutal); but here too there are difficulties in the interpretation of the relevant texts (Festus, p. 458; 476). Finally the festival of the Argei (Varro, *De lingua latina,* v, 45) has been taken to represent a further stage in which Rome was divided into four regions but did not yet include the Capitol and the Aventine. What is certain is that the traditional sacred boundary of Rome (the *pomerium*) did not include the Aventine until the times of the emperor Claudius. On the other hand, the religious calendar which was still in use in the age of Caesar provides evidence for the archaic culture of Rome. Its earliest part can be proved to go back to the 6th century B.C.; it does not contain any trace of the cult of Jupiter Capitolinus which was established in 509 B.C.

5. Archaeological Evidence.—There is some archaeological evidence that the Roman hills were inhabited in the second millennium B.C., but so far there is no proof of continuity between these early settlements and the 8th-century villages which can reasonably be taken as the components of early Rome. The archaeological evidence which has a direct bearing on the origins and early development of Rome is conveniently collected in the first three volumes of E. Gjerstad, *Early Rome* (1953–60). The most important facts are summarized here:

a. Tombs on the Esquiline, Forum (Via Sacra), Quirinal, and Palatine provide some essential archaeological data. The tombs on the Esquiline are numerically the most important. They are of the *fossa* (trench) type, and the burial rite seems to have been almost exclusively that of inhumation. They stretch from the 8th to the early 6th century B.C. The tombs on the Via Sacra go from the 8th to the early 6th century; they include both cremation and inhumation, but cremation prevails in the early tombs. On the Quirinal the earliest tombs (8th century) are of the *pozzo* (pit) type for cremation; in the 7th century *fossa*-type tombs for inhumation appear. The most important archaic tomb of the Palatine (discovered in 1954) is a cremation one, apparently of the 8th century.

b. Among the archaic buildings which have been explored the following deserve special mention: (1) remains of huts have been found on the Palatine near the Scalae Caci (late 8th century?) and beneath the atrium of the Domus Augustana (8th–7th century); (2) the Regia building in the Forum has been shown to go back at least to the 6th century (excavations are in progress), and the archaic finds from the area of the Temple of Vesta go back to about 550 B.C. or a little earlier; (3) the sacred area in the Forum Boarium in the region of the present church of S. Omobono contains, among others, two temples forming an architectural unit belonging to the 6th or early 5th century; (4) a votive deposit on the Capitoline Hill includes 6th-century materials; (5) votive deposits on the Quirinal (Church of Sta. Maria della Vittoria, Villino Hüffer) include late 8th-century materials and incidentally produced the Duenos vase which is dated to about 525 B.C.

c. Stratigraphic exploration of the Comitium and of the Forum seem to show that: (1) the Forum began to be occupied by huts in the 7th century; (2) about 575 a market place was laid out—the first real Forum Romanum; (3) the graveling of the open area later occupied by the Comitium was more or less contemporary with the construction of the first pebble floor of the Forum; (4) the votive deposit beneath the sacred place known as the *lapis niger* (so-called tomb of Romulus) goes back to the early 6th century.

d. Archaic architectural terra-cottas found on the Palatine and the Forum, on the Capitoline, and on the Esquiline represent armed horsemen, chariot races, banquet scenes, and gods, and are similar to those found in Veii and Velletri. They certainly belonged to sacred or public buildings and confirm the literary tradition that Etruscan and Greek artists worked in Rome in the late 6th and early 5th century.

e. The remains of the city wall traditionally connected with Servius Tullius (the "Grotta Oscura wall") have been proved to belong to the 4th century, but there are remains of earlier fortifications probably belonging to the 5th century.

6. The Development of Early Rome as Understood by Modern Research.—Certain archaeologists have produced revolutionary chronologies of early Rome on the basis of the archaeological evidence. For instance, Gjerstad has maintained that Rome was founded about 575 B.C., when the Roman Forum was laid out, as a unification of earlier villages; and that monarchy ended about 450 B.C. H. Müller Karpe (*Vom Anfang Roms* [1960]) put the origins of Rome in the 10th century and connected them with an emigration from Greek territories. On the other hand the French philologist G. Dumézil has made a bold attempt to relate Roman institutions to primitive Indo-European institutions. Such theories have so far found few supporters. The combination of literary and nonliterary evidence seems to suggest that Rome began to develop in the 8th century as a small community on the Palatine which soon absorbed other communities in neighbouring hills; a fusion of Latins and Sabines is mentioned in the tradition about Romulus. The origin of the name Rome is unknown, and it is not known why the Roman citizens were also called Quirites.

Rome was certainly governed by kings in early times. Later on in the republican period the patrician senator who acted as head of state when both consuls were dead was called *interrex* ("interim king")—a clear survival from the monarchic period. The kings were surrounded by an advisory body of *patres* or senators (first 100, then 300); and the citizens were divided into three tribes (Titii, Ramnes, Luceres) and 30 *curiae.* The 30 *curiae*

were the voting units of a popular assembly called *comitia curiata* which—according to the most plausible interpretation of the evidence—conferred power (*imperium*) on the kings and later on the consuls. Kingship does not seem to have been hereditary in Rome.

The senators naturally belonged to wealthy leading groups or *gentes*. Each aristocratic *gens*, comprising one or more families, had its own customs and cults. From early times the senatorial families appear to have monopolized those priestly functions (of pontiffs, *augures*, *flamines*, and *fetiales*) which were not performed by the king himself. In Rome there was never a priestly caste separated from the ruling aristocracy. The highly respected priestesses of Vesta were also provided by the ruling families. Service in the cavalry distinguished the members of the aristocracy: the numbers of the centuries of knights went up by steps from 3 to 18, perhaps as early as the monarchic period. It is far from certain that a clear-cut distinction between patricians and plebeians existed already during the monarchy. Traditionally, the father in each family (*paterfamilias*) had absolute power of life and death over wife, children, and slaves. Wives were much respected and had considerable freedom of movement, the authority of the husband being counterbalanced to a certain extent by that of the father.

With the possible exception of Romulus, all the kings mentioned by tradition must have existed. Tradition is probably also correct in connecting the capture and destruction of Alba Longa with the name of King Tullus Hostilius. The oldest Roman religious and political ties seem to have been with those other Latin communities which gathered together for festivals at the shrine of Jupiter Latiaris on Monte Cavo and in other sanctuaries. The precise political structure of the early Latin League (or Leagues) is unknown: there may already have been regulations enabling the members of one Latin community to buy, sell, and marry in other Latin communities (what Roman law called *jus commercii et connubii*). The destruction of Alba gave Rome considerable prestige among the Latins, and later Servius Tullius seems to have tried to establish a Latin federal sanctuary in Rome by building a temple of Diana on the Aventine.

Tradition puts the Etruscan king Tarquinius I (or Priscus) about 600 B.C. This is in agreement with the general expansion of the Etruscans to the south in the 6th century when they founded settlements in Campania and established close contact with the Greek colonists of Italy. The profound transformation in the civic centre of Rome about that time is to be connected with this Etruscan influence. As a consequence the successor of Tarquinius I, Servius Tullius (himself apparently not an Etruscan), was able to reorganize the Roman constitution on lines reminiscent of Solon. He created the *comitia centuriata* in which citizens were divided according to their ability to provide themselves with weapons and therefore according to wealth. (*See* also COMITIA: *Comitia Centuriata.*) In this assembly the greatest number of voting units went to the wealthiest section of the infantry. A change in the art of war at this stage must be assumed which increased the importance of the infantry in comparison with the cavalry. It is probable that this change was due to the introduction (perhaps via Etruria) of Greek hoplite tactics. The traditional figures for the Servian classification are, with some variations, as follows (the *centuria* being the voting unit):

18 centuries of knights (*equites*)							
80 centuries of the	first	class	(census of	100,000	*asses*)		
20 " " "	second	"	("	"	75,000	")	
20 " " "	third	"	("	"	50,000	")	
20 " " "	fourth	"	("	"	25,000	")	
30 " " "	fifth	"	("	"	12,500	")	

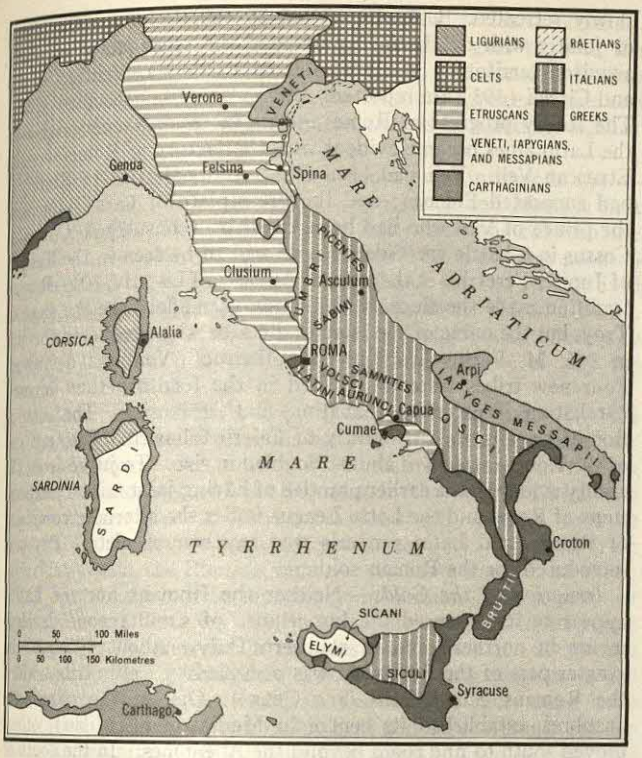
2 centuries of engineers and artisans are ranked with the first class.
3 centuries of musicians, supernumeraries, and proletarians are below the fifth class.

Not all the details of this scheme can go back to Servius Tullius. The very classification by coinage (*as*) cannot be as early as the 6th century, when Rome did not yet know of coinage. There appears to be no cogent reason for denying, however, that Servius Tullius created the *comitia centuriata*. He is also said to have introduced new local tribes in order to have a better fiscal organization and to be able to absorb into citizenship the numerous aliens attracted by the prosperity of Rome. The local tribes were perhaps originally 20 and grew up to 35 (in 241 B.C.). The three tribes of old and the curiate assembly did not disappear: the curiate assembly retained the formal right of conferring *imperium*. But both old tribes and *curiae* slowly ceased to be important.

Tradition seems again to be borne out when it gives an Etruscan successor to Servius Tullius. Tarquinius II is said to have reigned from about 534 to 510 B.C. Indeed it is known that about 535 the competition between Etruscans and Greeks in Latium and Campania became acute. The Etruscans and their Carthaginian allies defeated the Greek Phocaeans at sea off Alalia (Corsica) and controlled the seas near Rome. But about 524 the Etruscans were routed on land by Aristodemus of Cumae. Only a few years later the Cumaeans found themselves in the position of helping the Latins of Aricia—a centre of the Latin League—in a struggle against Etruscan bands. It is not surprising that Tarquinius and his Etruscans lost control of Rome while other Etruscan groups were in retreat both in Campania and Latium. The tradition is almost certainly correct also in presenting Rome as being faced with the hostility of the other Latins after the fall of Tarquinius. The young republic had to fight both against King Porsena of Clusium, who tried to reestablish Etruscan rule at Rome, and against the Latin cities, which wanted freedom. Finally the Etruscan menace was warded off (the details are uncertain), and the Latins were resoundingly defeated at Lake Regillus (about 499 B.C.). By the time the Etruscan king was compelled to leave Rome the territory of the Roman state seems to have extended over about 350 sq.mi. The Temple of Jupiter Capitolinus, which was inaugurated in the first year of the republic, was paradoxically the greatest monument of Etruscan rule in Rome.

Evidence of the prosperity and expansion of the Roman state under the Tarquinians is provided by the first treaty between Rome and Carthage, if the date of 508 B.C. attributed to it by Polybius (iii, 22) is accepted. Roman annalistic tradition, as preserved by Diodorus and Livy, does not know of any treaty between Rome and Carthage before 348 B.C., but much can be said in favour of the Polybian date. The treaty shows that under the kings Rome was in control of Ardea, Antium (Anzio), Circeii, and Terracina, and had been in a position to speak on behalf of all Latium. The treaty seems to have been an attempt of the new revolutionary government to maintain good relations with Carthage—the ally of the Etruscans—and to receive support in its claim over the rest of Latium. The influence of Carthage on Etruscan cities about 500 B.C. seems to be confirmed by inscriptions discovered in the territory of Caere in 1964; they contain dedications by a sovereign of Caere to a Punic goddess in both the Phoenician and the Etruscan languages (*Archeologia Classica*, xvi, pp. 49–117 [1964]).

7. The Young Republic.—*Constitutional Changes.*—As has been shown, the creation of the republic meant that a certain number of families took over the military command, the judicial power, and the priestly functions of the kings. The rape and suicide of Lucretia (*q.v.*) may well have been the occasion for the revolt. The name of Lucius Junius Brutus (*see* BRUTUS) as the head of the successful conspiracy can hardly be a later invention. The *pontifex maximus* (*see* PONTIFEX) was given the palace of the king, the Regia; and an elective magistrate, the so-called *rex sacrorum* or *rex sacrificulus* ("king of sacrifices"), performed the sacrifices for which a *rex* seemed to be necessary (*cf.* the *basileus*, "king" archon in Athens). But the main constitutional reform was the creation of two *praetores* (later known as consuls) to rule the state collegially for one year (*see* PRAETOR). The consuls were elected by the *comitia centuriata* and formally confirmed by the *comitia curiata*. At least as from the second part of the 5th century they were assisted by two *quaestores* who managed the state treasury (*aerarium; see* QUAESTOR). In an emergency one of the two consuls was empowered to appoint a *dictator* who thus became the supreme head of state for not longer than six months. The dictator (or *magister populi*) in his turn appointed a commander of the cavalry (*magister equitum*) as his subordinate. The other magistrates remained in office but obeyed the dictator. The institution of the dictator confirms that the infantry had become



PEOPLES OF ANCIENT ITALY

the strongest part of the Roman army. Indeed it is probable that the original Roman legion of 60 centuries was divided into two legions (each of 60 centuries, but each century reduced to 60 men) when the king was replaced by two consuls. The first dictator was appointed about 500 B.C. Later, about 443, a *censor* (*q.v.*) was introduced whose duty it was to take the census; he was elected in the *comitia centuriata* for a period of not more than 18 months at intervals of four to five years. The position of censor did not imply any military power (*imperium*) but soon commanded great prestige and developed into a general supervision of Roman life; the censor could remove a man from the Senate for misconduct.

The question has been asked whether these Roman institutions imitated preexisting Etruscan, Osco-Umbrian, or Latin institutions. Present knowledge is not sufficient to provide a clear answer to this question. Yearly magistrates were certainly common in Etruscan and other Italian communities, but the details of their powers and functions are uncertain. In many cases the probability of Roman influence on other cities must be reckoned with, rather than vice versa.

Military Decline.—The consequences of the political revolution that had happened in Rome soon became apparent. For perhaps half a century Roman military power declined. The territory shrank. Class struggles became fierce, and the general economic difficulties resulted in few public buildings and temples being built (the Temple of the Castores dedicated in 484 seems to have been the last important one of the early republic). Contacts with the Greek world, either directly or via Etruria, were less frequent throughout the 5th century. The Latin League, though defeated at Lake Regillus, did not return to the previous condition of subordination to Rome. Rome had to be content with a treaty (the so-called *foedus Cassianum*, negotiated by Spurius Cassius *c.* 493 B.C.), according to which Rome and the Latins became allies on equal terms and probably alternated in the command of joint military expeditions. A similar treaty was also concluded with the league of the Hernici. Both treaties were made necessary by the pressure of the Aequi and Volsci (*qq.v.*) and of certain Sabine tribes. The legend of Coriolanus preserves the memory of the attacks of the Volsci on Rome about 490 (*see* CORIOLANUS, GAIUS MARCIUS). The better-founded story of Cincinnatus relates to wars against the Aequi about 458 (*see* CINCINNATUS, LUCIUS QUINCTIUS). Military colonies established by the Romans (jointly with the Latins) at Signia, Velitrae (Velletri), and Norba were not always able to hold their own against the Volsci; Velitrae at least was captured by them.

Patricians and Plebeians.—Internally the new aristocratic leaders reinforced their ranks by attracting at least one powerful *gens* from abroad: the Sabine *gens Claudia* (*c.* 505 B.C.). But as soon as their power was consolidated they raised a sharp barrier between themselves and the other Romans. All that is known seems to point to the conclusion that a clear distinction between patricians and plebeians first developed in the early 5th century. It resulted in the almost complete exclusion of the plebeians from the magistracies. The plebeians were not equally excluded from the Senate, but the patrician senators, who must have been in the majority, organized themselves into a privileged group and arrogated to themselves the right to ratify the decision of the *comitia* (*auctoritas patrum*, where *patres* = patrician senators).

At the same time the continuous wars and the loss of trade worsened the conditions of the poorest plebeians. The rich patricians who had less opportunity to buy slaves from abroad took advantage of the existing right to enslave the debtors. Other plebeians were reduced to the condition of followers (*clientes*) of the patricians; they gave service and obedience in exchange for protection. Communal land (*ager publicus*) was rented by patricians at a nominal price and annexed to their estates. There is evidence of famines and of import of grain from Sicily.

The rich plebeians who were excluded from power and the poor plebeians who were in danger of enslavement united in the struggle against the patricians. Disorders followed. In 486 Spurius Cassius, one of the most eminent men of the time, was killed when he tried to help the plebeians. After his disappearance there was a period of seven years in which one of the members of the *gens Fabia* was invariably a consul. The virtual control of the state by the Fabii was ended only by the Battle of the Cremera River, in which the Fabii and their clients, waging a war against the Etruscans, met disaster.

The plebeians organized themselves into action against the patricians and resorted to strikes or secessions (the first of which happened in 494). They elected leaders called *tribuni plebis* (*see* TRIBUNE) in an assembly of which the voting units were the local tribes (*concilia* or *comitia plebis*). The *tribuni* were ten in 449 B.C., but had probably been two and then five in earlier years. They were assisted by two *aediles* (*see* AEDILE) who kept the archives of the plebs in the Temple of Ceres on the Aventine. The plebs became a state within the state. The *tribuni* asserted their right to veto any act performed by a regular magistrate (*intercessio*). The plebeians took an oath to uphold their inviolability (*sacrosanctitas*). The patricians were obliged to recognize the existence of the plebeian institutions (*Lex Publilia* of 471). This only made more pressing the plebeian claim that the deliberations in the *concilia plebis* (*plebiscita*) should have legal force. The plebeians also wanted the whole of the laws of the state to be codified in writing in order to break the exclusive patrician knowledge of them.

Many times the "conflict of the orders" seemed near a solution, but in fact it lasted for two centuries. Its most important early stage is represented by the decemviral legislation of 451–450. In 451 the Roman constitution was suspended, and the patricians were entrusted with the preparation of a code of laws. They prepared ten tables of laws, and a new college of *decemviri* (*q.v.*) which included some plebeians was appointed in 450 and prepared two further tables. According to tradition, the last two tables were particularly unfavourable to the plebeians insofar as they codified the prohibition of marriage between patricians and plebeians. The second decemvirate was dominated by Appius Claudius and retained office until Virginia (alleged to have been a plebeian) was killed by her father to save her from Appius Claudius' lust.

The decemviral legislation must have represented an uneasy compromise between patricians and plebeians. The plebeians obtained the codification of the laws and managed to be admitted to the decemvirate, but they had to accept the permanent separation of the orders. It is not known whether the decemvirate was

envisaged as a provisional magistracy or as a permanent institution to replace both the consulate and the tribunate. At all events the regime came to a premature end, and the old magistracies were re-established.

Somehow patricians and plebeians had learned to work together, and the lesson was not forgotten. A tribal assembly of the plebeian type but also including the patricians (*comitia tributa*) acquired increasing importance. It was used for routine legislation, for the election of the quaestors and of the officers of the army (*tribuni militum*), and later for other magistrates. In 449 a *Lex Valeria Horatia* seems to have given legal force to the *plebiscita*, but the details are obscure and controversial; and later, in 339 and 287, other laws were passed for the same purpose. Marriage between patricians and plebeians was allowed in 445, and in the same year it was decided that *tribuni militum*, enjoying the authority of consuls, might be elected in certain years from both patricians and plebeians. The details are again very obscure, but the main facts are not in dispute. From 444 to 367 the Romans were led in some years by two consuls, in other years by a variable number (three to six, perhaps even eight or nine) of *tribuni militum*. Plebeians appear among the *tribuni*, but only seldom—much less often than might be expected.

B. Rome, 449–264 B.C.

1. The State of the Sources and Their Reliability for the Period.—Dionysius of Halicarnassus' account is available down to 443, Diodorus' to 302–301. Livy's first decade goes as far as 293. There is also valuable information in Zonaras' epitome of Dio Cassius, in Velleius Paterculus (especially about colonies), Appian, and other sources. The existing fragments of the Twelve Tables represent contemporary evidence for the social structure of Rome, and the consular Fasti (lists of consuls) provide information about the governing class. If present evidence were invariably unambiguous and trustworthy, we should have enough to write a satisfactory history of this period. Unfortunately, neither Livy nor the other literary sources can be taken at face value: a classical example is provided by the conflicting information about the Battle of the Allia in which the Romans were defeated by the Gauls *c.* 390. The fragments of the Twelve Tables raise more problems than they solve, and even the Fasti, though undoubtedly reliable, are difficult to interpret. It has already been mentioned how difficult it is to interpret satisfactorily the curious fact that in certain years (continuously between 391 and 367) a number of *tribuni militum* replaced the praetors-consuls as heads of the state. Another difficulty is that it is not known how the relations between Rome and the Latin League developed—and more particularly to what extent the most ancient "Latin" colonies can be described as Roman foundations (for one view *see* E. T. Salmon, "Rome and the Latins," *Phoenix*, vii, 93 ff., 123 ff. [1953]). Indeed we have only the vaguest notion of the federal organization of the Latins.

A third obstacle is our ignorance about the structure of private ownership in early Rome. Mommsen's theory that originally collective ownership prevailed did not survive R. von Pöhlmann's trenchant criticisms (*Geschichte der sozialen Fragen und des Sozialismus in der antiken Welt*, ii, 3rd ed., pp. 327 ff. [1925]). This, however, does not dispose of all the difficulties. The *curiae* may have been founded upon some communal ownership. A word like *mancipatio* to indicate transfer of property may imply that sale was originally limited to movable objects which can be seized (*manu capere*). The word *heredium*, "hereditary estate," was used in the Twelve Tables to indicate the orchard, not the fields—which may imply that only the orchard was private property. Yet the balance of the evidence would suggest that even during the monarchy private property was unrestricted. The differentiation between patricians and plebeians can hardly be explained unless there was private ownership of the land. (*See* also Roman Law: *The Law of Property and Possession.*)

2. The Course of Events, 449–366 B.C.—The decemviral laws reduced the tension between patricians and plebeians and reinforced Rome. The Battle of the Algidus Pass (dated June 17 or 18, 431), in which the dictator A. Postumius Tubertus defeated the Aequi, must be accepted as historical. The Volsci and the Aequi slowly retreated. Colonies settled by the Romans, either alone or jointly with the Latins, garrisoned the reconquered or newly acquired territories. Colonies at Ardea (442), Velitrae (404), and Circeii (393) are reported; and Fidenae was occupied in 425. The steady progress of Rome and its increasing superiority over the Latin allies became evident with the victory of Rome over the Etruscan Veii. Veii had been the traditional rival of Rome; it had supported Fidenae; and the breastplate of Lars Tolumnius, the prince of Veii who had been killed by (consul?) A. Cornelius Cossus in a battle for Fidenae, was still to be seen in the Temple of Jupiter Feretrius in the time of Augustus (Livy, iv, 20). Roman tradition made the siege of Veii a ten-year affair like the siege of Troy, but the name of the Roman dictator who conquered the city in 396, M. Furius Camillus, is authentic. Veii was destroyed. Four new tribes were established in the territory thus annexed (Stellatina, Tromentina, Sabatina, and Arniensis). The occupation of Capena and apparently of Falerii followed. The territory of the Roman state was almost doubled in size. To judge from the scanty evidence, the earlier practice of having joint military expeditions of Rome and the Latin League under the alternate command of Roman and Latin generals was by then obsolete. Pay was introduced for the Roman soldiers.

Irruption of the Gauls.—Neither the Romans nor the Latins appear to have sensed the importance of simultaneous developments in northern and in southern Italy. About 400 B.C. the greater part of the Po Valley was occupied by Celtic tribes which the Romans called Galli (*see* Celt). One of the tribes, the Insubres, established its centre in Mediolanum (Milan), others moved south to find room beyond the Apennines. In the south of Italy the Sabellian peoples pressed forward and steadily reduced the area of Greek and Etruscan influence. Capua and Cumae had fallen into their hands by about 420 (dates uncertain). On the Tyrrhenian (west) coast north of the Laus River only Naples (Neapolis) and Elea (Velia) remained Greek. Other tribes of the same Sabellian group, the Lucanians (*see* Lucania), were helped by Dionysius I of Syracuse to defeat a league of Greek cities of southern Italy, while still other Sabellians (known as Samnites; *q.v.*) spread their power south and west of Latium. These changes ultimately affected the whole Italian peninsula. They meant the superimposition of more primitive tribal organizations on the city-states of Etruria and Magna Graecia, though the superior civilization of the conquered nations slowly imprinted itself on the conquerors.

About 390 (the conventional date) a horde of Celtic Senones (*q.v.*) marched through Etruria and tried to occupy Clusium; then (tradition does not convincingly state the reasons) it proceeded toward Rome. Near the little stream of Allia—either on the right bank of the Tiber, as Diodorus says, or more probably on the left bank—the Roman legions were wiped out. Once the army was defeated, the city walls, if they existed at all, were not strong enough to prevent occupation. The event was registered also by Greek historians. Roman tradition is almost unanimous in maintaining that the Capitol was never occupied by the Gauls, but there is a faint voice of dissent in the poet Silius Italicus (O. Skutsch, "The Fall of the Capitol," *Journal of Roman Studies*, xliii, pp. 77–78 [1953]).

External Relations.—The Gauls had come to plunder rather than to stay, and they left after having exacted ransom. The Romans, under the leadership of Camillus, reorganized their army, rebuilt the city, and built the wall which later generations thought to be Servius Tullius' work. The Etruscan Caere distinguished itself by its readiness to support the rebuilding of Rome. It has been suggested that in 386 Rome and Caere entered into some agreement which enabled the citizens of Caere to become Roman citizens and vice versa (M. Sordi, *I rapporti romano-ceriti* [1960]).

There are other signs that Rome entered into closer relations with Etruscan cities and with Carthage. Without the collaboration of their fleets it is difficult to see how Rome could even have attempted to establish what turned out to be unsuccessful settlements in Sardinia and Corsica (Diodorus, xv, 27, 4; Theophrastus, *Historia Plantarum*, v, 8, 2). Furthermore it is known from Livy (ix, 36) that in the 4th century young Roman aristocrats were

sent to Caere to complete their education and to learn Etruscan. The friendship with Carthage, which probably goes back to the beginning of the republic, remained a constant element of Roman policy until about 270, even when the relations between Rome and the Etruscan cities (traditionally the friends of Carthage against the Greeks) took a turn for the worse.

The Greek Massilia (Marseilles) also showed interest in the recovery of Rome. It is not known when Rome and Massilia first became friends. The picture of the early relations between the two cities is not clear (if it were, we should be in a better position to understand the early penetration of Greek art and religion into Rome). But when Camillus occupied Veii, Rome placed a golden bowl in the treasury of the Massiliotes at Delphi as an offering to Apollo. Tradition adds that Massilia helped Rome to pay the ransom to the Gauls.

All these friendships, however, did not compensate for the serious deterioration in relations between Rome and its immediate Latin neighbours. Restoration of Roman hegemony in Latium was the main concern of the Romans in the 30 years after the sack of Rome. Even if Polybius is not strictly correct when he says (ii, 18, 6) that in these 30 years the Gauls refrained from attacking Rome, the Romans were not seriously troubled by them. They reestablished their supremacy in Latium by a system of Latin colonies: Satricum (?) in 385; Sutrium and Nepete, 383; Setia, 382. The new Latin colonies were made up of Roman citizens who were prepared to forfeit their citizenship in return for land in the new settlements. The settlers must have been proletarians and, as such, not liable to ordinary military service in the Roman army. In 381 Tusculum seems to have received Roman citizenship. In 358 both Hernici and Latins were compelled to renew their old alliance with Rome. The new treaty changed the terms of Spurius Cassius' treaty on some points. Antium was deprived of part of its territory which was turned into two tribes (Pomptina and Poblilia).

Patricians and Plebeians.—The need to put the Roman state in order after the Gallic disaster must also have influenced the relations between patricians and plebeians. The plebeians pressed their claims and found supporters among the patricians. One of their champions was Marcus Manlius Capitolinus, who organized an unsuccessful *coup d'état* about 385. After years of struggle Camillus, who had been elected dictator for the fifth time in 367, was compelled to accept the main plebeian requests. *Concordia* became the watchword of the new political situation. According to the proposals of the tribunes of the plebs Gaius Licinius and L. Sextius, two consuls or praetors were again to be the regular supreme magistrates each year, and one of them was to be a plebeian. Furthermore a limit was put on the amount of public land to be held by any individual; tradition mentions 500 *iugera* (300 ac.) as the maximum, but this probably reflects a later situation. The conditions of debtors were improved. At the same time new magistrates were created. The two praetors or consuls were given a *minor collega*, called praetor like themselves, who was made chiefly responsible for civil jurisdiction, though he could also command an army. The third praetor was below his colleagues (*minor*) in so far as they could veto his decisions. Ultimately the name praetor was confined to him, and consul became the exclusive name for the supreme magistrate. Two "curule aediles" were created to collaborate with the "plebeian aediles" in the supervision of streets, markets, public works, games, etc. Patricians and plebeians alternated annually as curule aediles, while the plebeian aediles remained plebeian. The third praetorship was not open to the plebeians until 337. There was a plebeian dictator in 356 and a plebeian censor in 351. The legislation of 367–366, however, was not accepted without further resistance, as shown by the fact that the election of a plebeian to the consulship became regular only from 320. The mysterious *Leges Genuciae* of 342 and the *Leges Publiliae* of 339 seem to have further advanced the pacification of the two orders. One of the *Leges Publiliae* apparently abolished, or reduced to a formality, the consent of the patrician senators (*auctoritas patrum*) to the deliberations of the *comitia centuriata*. Another *Lex Publilia* reinforced the validity of the *plebiscita* as binding on both orders.

3. Military Expansion and Internal Consolidation, 366–338 B.C.—Internal concord did not come too soon. In 359 Tarquinii declared war against Rome and was followed by Falerii and Caere. The Volsci and the Hernici too attacked Rome, and the Gauls reappeared in strength. Rome had to turn to the Samnites for help and fought for life. The Etruscans were quickly defeated. In a complex settlement Caere agreed to a 100-year truce and apparently was incorporated in the Roman state as a *civitas sine suffragio* (353), which meant that the citizens of Caere became citizens of Rome without being allowed to vote in the *comitia*. This new type of half-citizenship was later used by the Romans when they wished to extend their territory without increasing the size of their political assemblies. In 351 Tarquinii and Falerii agreed to a 40-year truce. The Gauls were at length compelled to cease their attacks, and the Carthaginians, with whom a new treaty was signed in 348, helped to ward off Greek privateers from the shores of Latium.

What happened next is most obscure. The Samnites unexpectedly appear as enemies of Rome in a war that lasted from 343 to 341. The reality of this war can hardly be denied, notwithstanding Diodorus' silence. Livy suggests that Rome fought the Samnites in order to defend the Campanians. Then there was a reversal of alliances in 341. Latins, Volscians, Sidicini, and Campanians turned against Samnites and Romans. Romans and Samnites defeated their enemies at Trifanum near Suessa Aurunca. The Campanians made a separate peace (340). Apparently, their aristocracy (the "knights") had been pro-Roman during the war and now received Roman citizenship as a reward; the details are controversial. Two years later the son of the great Camillus, L. Furius, and his colleague Gaius Maenius ended the war by resounding victories over Volscians and Latins. Antium was occupied and a Roman colony placed in it to guard the port. The Latin League was dissolved, though the ancient common worship on the Alban Mount continued.

The individual Latin cities were variously treated. Tusculum, which had rebelled, Lanuvium, Aricia, Nomentum, and Pedum were granted full citizenship. Their city administration was reformed and represented perhaps the beginnings of the Roman municipal system. Seven Latin colonies (Sutrium, Nepete, Norba, Ardea, Signia, Setia, Circeii) and other places (Praeneste, Tibur, Laurentum) remained allies, but Praeneste and Tibur lost some territory. According to one of the possible interpretations of Livy, viii, 14, the rest of the Latins were left free but were forbidden to have special ties of trade (*commercium*) and intermarriage (*connubium*) with each other, though not with the Romans. Velitrae was singled out for severe treatment. The anti-Roman leaders were driven out and their lands distributed among Romans. Two new tribes (Maecia and Scaptia) were created on conquered territory (332). The people of Fundi, Formiae, Capua, Cumae, and Suessula were granted *civitas sine suffragio* and preserved a considerable amount of autonomy. The Romans made useful investments in Campania, and the two aristocracies frequently intermarried. Campanian art, and especially Campanian popular comedies, reached Rome.

Roman Society.—This was the period in which Roman society began to take the shape that was to remain characteristic until the time of the Gracchi. It was a society in which a mixed aristocracy of patricians and plebeians controlled the state by filling the magistracies and the seats of the Senate (300 life members). The senators, though chosen by the censors, were by now increasingly former magistrates. Conflicts between Senate and magistrates were reduced to a minimum by the common background, and the collective experience of the senators was bound to have an overwhelming influence on the conduct of state affairs. The tribunes of the plebs and the plebeian aediles were recognized as *de facto* magistrates and were chosen from the upper strata of the plebs. Families which could boast of a consul were the *nobiles*. Senators who had no senator among their ancestors were *homines novi*, "new men"; they were always few. Intermarriages and political alliances counterbalanced the natural rivalries between aristocratic families.

Land was the basis of wealth, but we must beware of trans-

ferring to earlier times the picture of Roman agriculture contained in Cato's *De agri cultura* (2nd century B.C.). Trade was actually discouraged in senatorial families, but it was not difficult for them to trade through agents. Slaves, no doubt, existed both on the country estates and in the city houses of the rich. A tax on manumissions was introduced in 357. A vast amount of land, mainly taken from enemies, had become the property of the Roman state (*ager publicus*) and was rented by private citizens; members of the aristocracy were naturally in the best position to rent large portions. Membership of the rural tribes, which increased from 16 to 31 in number between 509 and 241, was restricted to landholders. Proletarians and freedmen (the latter even if landholders) were confined to the four urban tribes. An attempt by the patrician senator Appius Claudius to open the rural tribes to proletarians and freedmen was successful in 312 but defeated in 304. Thus landed gentry kept control of the *comitia tributa* and of the *concilia* (*comitia*) *plebis* where the tribes were the voting units. After 304 removal from a rural to an urban tribe became a punishment.

The relations between the poor and the wealthy were dictated by the obligations of clientship. These obligations were particularly strict in the case of freedmen. The laws affecting debtors were severe, even cruel. Information about rates of interest is uncertain (*cf.* Tacitus, *Annals,* vi, 16), but usury was practised. The Twelve Tables recognized the position of debtors as *nexi* or bondsmen of the creditors; but the *nexum* was abolished by a *Lex Poetilia* in 326. On the other hand the upper class took its obligations toward the state (and its own clients) seriously and developed an ethical code of its own.

The traditions of the leading families (*mos maiorum*) counted for much and were closely connected with the notions of authority, gravity, valour (*virtus*), dignity, glory, trust (*fides*). *Otium* (literally "leisure"), including intellectual activities, was opposed to *negotium,* public service. Some of these abstract notions, such as *fides, concordia, bona mens,* were worshiped as goddesses as early as the 4th and 3rd centuries B.C. Aristocratic families displayed the images and the list of magistracies of their ancestors in the halls of their houses, and any funeral was the occasion for an elaborate display of ancestral glories. The ceremony of the triumph for victorious generals was deemed to be the highest honour and had religious overtones. Pride in family connections contributed to the importance of married women. The Roman *matronae* were proud both of their own ancestry and of their husbands' positions. Their code of behaviour was strict, but they moved about in relative freedom. A married daughter could, according to the form of her marriage, either remain under the power (*manus*) of her father or pass into the power of her husband. Sons remained in the power of their father as long as the father was alive, and this power included the right to kill and to sell. (*See* further ROMAN LAW: *The Law of Persons.*)

The majority of the rules of the Twelve Tables remained in force. The original bronze had probably disappeared when the Gauls burned Rome about 390. But their text was known and studied at school as late as Cicero's day; only fragments of it have survived. The code as a whole was of a secular character and well suited to a community of peasant proprietors with little commerce and writing. It presupposed a patriarchal family in which the *paterfamilias* made a testament and manumitted slaves. It forbade the trial of citizens on a capital charge by any assembly or tribunal other than the *comitia centuriata.* The nature and limits of the jurisdiction of the *comitia centuriata* are, however, a doubtful matter. It has been suggested that in the relatively primitive conditions of the 5th century ordinary murders were left to private vengeance, and only political crimes were tried by the *comitia* (*see* W. Kunkel, *Untersuchungen zur Entwicklung des römischen Kriminalverfahrens* [1962]).

Religion.—The religion of the aristocratic upper class gradually shifted from agrarian and family cults to a centralized worship of state gods. Old cult associations, such as the *sodales Titii* or even the *Fratres Arvales* (*see* ARVAL BROTHERS), lost their importance and were not revived until the time of Augustus. But the cult of the Capitoline triad (Jupiter, Juno, and Minerva) and that of Vesta became central. Mars was made the chief military god, indeed the father of the founder Romulus. Some old Roman cults were hellenized (as is probably the case with the goddess Ceres), and the cult of Apollo was imported from Greece. State cults are never conspicuous for mythology, and the Roman cults were very poor in myths. The colleges of the pontiffs, augurs, *fetiales,* and Vestal Virgins became more important than the archaic priests called *flamines* and the *rex sacrorum.* The priestly colleges were in practice reserved for the aristocracy even when they were thrown open to the plebeians in 300 (*Lex Ogulnia*). In the 4th century a new body of ten men (*decemviri sacris faciundis*) took charge of the consultation of Sibylline oracles and other ceremonies, mainly of Greek origin. (*See* also ROMAN RELIGION.)

Army.—The Roman army excluded the proletarians from the legions but was ready to use allies as auxiliaries. Indeed the policy of the Romans toward the conquered nations was increasingly determined by the desire to use them as allies in future wars. In the 4th century the ordinary Roman levy included four legions of about 4,000 men each. Each legion was now divided into 30 *manipuli* disposed in three lines, *hastati, principes,* and *triarii,* supported by lightly armed soldiers (*velites*) and 300 knights. Mass tactics, of the type which was common to Greeks and Etruscans, were replaced by more mobile and elastic maneuvering—to which the example of the Samnites may have contributed something.

Altogether Roman society reached a considerable degree of stability and self-confidence. Stability had been obtained by a skilful and imaginative exploitation of military victories, with their opportunities for colonization, individual distribution of land, booty; it depended on constant warfare for its further preservation. Self-confidence was reflected in the readiness to extend Roman citizenship and in other remarkable developments of juridical thought. The creation of the praetor was the starting point for progressively bold interpretations and modifications of existing legal practices. The praetor was advised by a committee of legal experts (*jurisconsulti*) who slowly replaced the pontiffs as authorized interpreters of the law.

4. The Samnite Wars.—Such, in broad outline, was the Roman society which now found itself involved in new wars as a result of the expansion in the south. Naples was compelled to become an ally of Rome in 326 during a war between Naples and Capua. Latin colonies were placed at Cales and Fregellae, a Roman colony was settled at Tarracina (Anxur); alliances were concluded with Fabrateria and Frusino, and *civitas sine suffragio* was granted to Acerrae and to the conquered and half-destroyed Privernum. At least some of these events combined to persuade the Samnites to start a war against the Romans in 326. The Romans allied themselves with the Apulians. Details of the ensuing struggles are uncertain. But at the Battle of the Caudine Forks near Beneventum a Roman army surrendered and admitted defeat by passing under a "yoke" of spears (321). Peace was made and perhaps kept for some years (though tradition says otherwise). Rome took advantage of the interval to consolidate its badly shaken rule in Campania. *Praefecti* (*see* PREFECT) were sent to Capua and Cumae in 318. Two new tribes (Falerna and Oufentina) were created, one on land north of Capua, the other on land taken from Privernum.

Hostilities with the Samnites apparently were not resumed till 316. The following year the dictator Q. Fabius Rullianus suffered defeat at Lautulae near Tarracina. But in 314 the Romans won a victory at Tarracina which stopped the rebellion of Capua and restored Roman prestige. A Latin colony was planted at Luceria. Swiftly the system of Roman alliances and colonies was reinforced and extended. Other Latin colonies were planted at Suessa Aurunca, in the island of Pontia, at Saticula, and at Interamna. Calatia and Nola were captured and made allies. The first of the great Roman roads, the Via Appia, joined Rome with Capua; and a modest fleet was put under the control of two newly created magistrates, the *duoviri navales* (311).

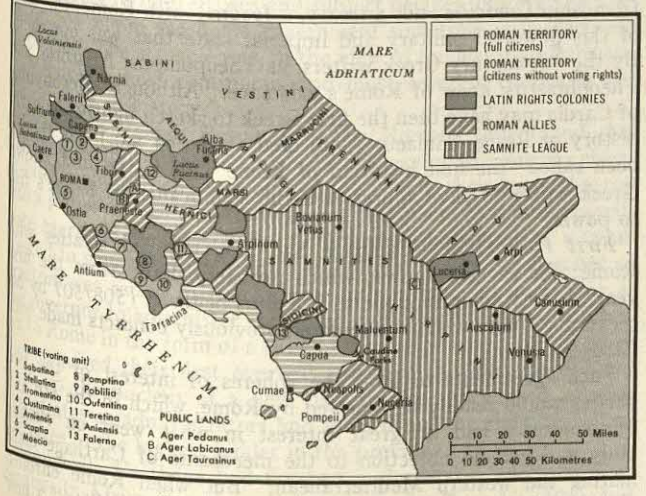
By the time many of the Etruscan cities finally decided to throw in their lot with the Samnites against the Romans in 310, the Romans were in a position to retaliate effectively. The consul Q. Fabius Rullianus brought his soldiers into the heart of Etruria

through the Monti Cimini. Cortona, Perusia, and Arretium made treaties with Rome. Volsinii was conquered, and Tarquinii was compelled into another 40-year alliance (308). But the Aequi, Marsi, and Paeligni became actively hostile. The Samnites attacked again in 307, and the Hernici rebelled in 306. Anagnia, the chief city of the Hernici, was taken by the Romans and incorporated as *civitas sine suffragio*. So was Frusino, after having been deprived of part of its territory. Then the Romans crushed Marsi, Aequi, and Paeligni. In 304 the Samnites concluded a peace which left them free within their frontiers. Latin colonies were planted at Alba Fucens, Carsioli, and Sora to control Aequi, Paeligni, and Hernici. Arpinum and Trebula were given half-citizenship.

Colonization.—While the enemies of Rome had clearly been unable to coordinate their efforts, Rome was remarkably consistent in its methods of fighting and ruling. Citizen colonies were rare before the First Punic War: Ostia (perhaps a settlement of the monarchic period which was reinforced after 350), Antium (338), Tarracina (329), Minturnae (295), Sinuessa (295), Castrum Novum (*c.* 289?), Sena Gallica (about 283), and possibly Pyrgi. They were all small (the standard figure is 300 colonists, each of whom was given two *iugera* of land) and placed by the sea in order to safeguard the coast against attack—perhaps more effectively than a permanent fleet. The colonists were men liable to military service who were given a special discharge to fulfil their duties as colonists. The Latin colonies were normally inland (in this period Circeii, 393; Paestum and Cosa, 273; Ariminum, 268, are the exceptions); they blocked the routes to and from enemy territories. The assignation of land to the Latin colonists was generous, and Latin allies as well as Roman proletarians were eligible. Rome was on the way to becoming not only the most important power of Italy but also the most civilized and best organized.

The Greeks of Italy were declining. Various attempts to inject new blood into them (expedition of Archidamus of Sparta *c.* 338, of Alexander the Molossian *c.* 330, of Cleonymus of Sparta in 303) were of little avail. The more serious effort by Agathocles to establish a strong Greek state with its centre in Syracuse came to an end with his death in 289. Livy mentions a treaty between Carthage and Rome in 306 which may have given a free hand to the Romans in the peninsula and to the Carthaginians in Sicily. About 303 the Romans formed an alliance with the Lucanians which perhaps contributed to Cleonymus' departure from Italy.

Rome was consolidating its progress (Latin colony at Narnia near the Umbrians in 299; creation of the new tribes Aniensis and Teretina in the same year) when a new Gallic invasion provided its enemies with an unexpected opportunity. Samnites and Etruscans officially or unofficially became the allies of the Gauls, and the Umbrians and the Sabines also took part in the struggle against Rome. The Romans answered by ruthlessly destroying and occupying the Samnite villages. Then in 295 they routed a joint army of Gauls and Samnites at Sentinum in Umbria. One of the consuls, P. Decius Mus, ritually sacrificed himself (*devotio*) for the victory of his country—not the first of his family to do so.



CENTRAL ITALY, ABOUT 300 B.C.

The war continued. Though there were further serious setbacks for the Romans, Rome was no longer in danger. In 291 the Romans planted a large Latin colony at Venusia in Apulia. The war was ended by Manius Curius Dentatus in 290. The Samnites renewed their old alliance with the Romans and remained independent for a while. The whole Sabine territory was annexed to the Roman state. There was a large confiscation of land for the benefit of Roman citizens; the Sabines who survived were given *civitas sine suffragio* which was transformed into full citizenship in 268. A Latin colony was planted at Hadria.

Coinage.—In 289 the triumvirs of the mint were created. This is the first certain evidence for the existence of coinage in Rome and may be connected with the introduction of the *aes signatum*, rectangular bronze bars, bearing types on each side, of fairly constant weight. The so-called *aes grave*, cast bronze coins, is perhaps contemporary, but its chronology is doubtful. Very soon Rome's involvement in the Pyrrhic War led to the production of two silver issues (signed ROMANO) suitable for use in southern Italy. Roman silver coinage proper started in 269 and introduced bimetallism into the Roman economy (*cf.* R. Thomsen, *Early Roman Coinage*, i–iii [1957–61]).

Social Developments.—Great political leaders emerged in this period of reform. Almost all of them—whether they came from the patriciate or the plebs—tried to reduce the powers of the patricians and of the Senate and to improve the lot of the poorer citizens. Q. Publilius Philo, four times consul (first in 339), was the propounder of the *Leges Publiliae*. Appius Claudius Caecus, the censor of 312, who tried to eliminate the aristocratic control of the rural tribes, was also the enterprising builder of the great road and of the aqueduct which preserves his name. Manius Curius Dentatus was behind the conquest and colonization of the Sabine territory. A client of Appius Claudius, Gnaeus Flavius, a freedman's son, became a curule aedile in 304 and worked to spread the knowledge of legal formalities among ordinary citizens.

There was by now a large zone of agreement between the patricians and the plebeian upper class. Yet the right of any Roman to be judged by the *comitia centuriata* on capital charges (*provocatio*) and the complete parity of the *plebiscita* with the *leges* remained vital issues for all the plebeians. It would indeed have been impossible for the wealthy plebeians to make a stand against the poorer plebeians on such issues. About 286 the plebs organized its last secession and finally obtained full legal status for its *plebiscita* (*Lex Hortensia*).

The aristocrats of both orders, however (now reinforced by the aristocrats of the Latin cities and of Campania), were agreed in preferring indirect control of conquered enemies to occupation of enemy territory. The poorer peasants, on the other hand, were more interested in conquests which would result in their obtaining land. For that reason they favoured expansion toward the north. Their land hunger was an important factor in that development. New attacks of the Gauls made such expansion imperative. In 284 the Senones defeated the Romans near Arretium and provoked new unrest among Etruscans, Samnites, and Lucanians. The Romans marched into the *ager Gallicus*. A Roman colony was planted in Sena above Ancona. In 283 the consul P. Cornelius Dolabella routed Galli, Boii, and Etruscans near Lake Vadimo, south of Volsinii, a victory which was repeated in the following year. Rome made peace with the Gauls on easy terms and strengthened its influence in Etruria by giving support to the local aristocracies (for instance of Arretium) against the lower classes.

5. Pyrrhus and the Roman Unification of Central and Southern Italy.—In 282 the Romans helped Thurii against the Lucanians and offended the Tarentines by sending their ships into the waters of Tarentum despite old agreements to the contrary. The Tarentines had been suspicious of Rome since the days of Cleonymus. Now they asked for the help of Pyrrhus (*q.v.*), king of Epirus. Pyrrhus' expedition (25,000 soldiers and 20 elephants) was in line with previous attempts by Greek chieftains to seek in Italy the power they were unable to obtain in Greece. But his forces were greater, and his enemy, Rome, was in a different class from the southern tribes met by his predecessors. The Roman legions, confronted with the Macedonian phalanx and with ele-

phants, were defeated twice, at Heraclea (280), and, less seriously, at Ausculum (279).

Yet offers of peace by Pyrrhus were refused. Appius Claudius was the leader of the war party. As long as the allies remained faithful to the Romans, time was working in their favour. Their manpower was far greater than that of Pyrrhus. Shortage of men and money soon persuaded Pyrrhus to proceed to Sicily, where the Greeks needed help. This move inevitably reinforced the old friendship between Rome and Carthage. Rome, if somewhat reluctantly, entered into an alliance with Carthage and used Carthaginian ships to transport soldiers. When Pyrrhus came back from Sicily, where he had achieved nothing, he found Rome stronger and his own allies weaker. In 275 he was beaten by the Romans at Malventum (Maluentum; later Beneventum) and conceded defeat by sailing back to Greece. The garrison he left at Tarentum surrendered in 272.

Consequences of Victory.—This victory was the occasion for the reorganization and consolidation of Roman rule in central and southern Italy. The Samnite League was broken up. A Latin colony was settled at Beneventum. The Lucanians were deprived of Paestum, where a Latin colony was planted. A Roman garrison was placed in Tarentum. The allies, old and new, were required to provide either soldiers or ships; and there were confiscations of land even outside the territories used for settling colonies. In Etruria a Latin colony was established at Cosa. When the serfs of the Etruscan Volsinii rebelled about 264, their masters called in Roman help. Rome destroyed the city and resettled the Volsinian aristocrats in a new place (perhaps Orvieto). Thus the Romans demonstrated again that they were prepared to protect the upper classes, at a price.

In 268 a Latin colony was sent to Ariminum in the *ager Gallicus,* and special privileges were granted to the settlers which became the basis of the so-called *jus Ariminensium* (A. Bernardi, *Studia Ghisleriana,* i, pp. 237–259 [1948]). In the same year the greater part of the Picentes, after a rebellion, was incorporated in the Roman state with *civitas sine suffragio,* and a Latin colony was settled among them at Firmum (264). Rome now had five colonies on the Adriatic coast.

The victory over Pyrrhus made a great impression on the Hellenistic world. The Ptolemaic government of Egypt (not to speak of the city of Apollonia in Illyria) sought friendly relations with Rome. As the *Alexandra* by Lycophron shows (it was probably written about 270, but the date is controversial), the Greeks realized that a new great state was rising in the west. About 264 the historian Timaeus wrote a special book on the war between Rome and Pyrrhus. Even the poet Callimachus had something to say about Roman virtues.

The Confederacy.—In terms of manpower and military organization the Roman confederation was formidable. It extended from Ariminum and Pisa to the Strait of Messina. Its core was the Roman *Res publica* which included (*a*) full citizens enrolled in the tribes, (*b*) half-citizens or *cives sine suffragio.* Full citizens lived either in Rome or in *municipia* and *coloniae.* Both *municipia* and *coloniae* eventually achieved a form of self-government with annual magistrates. The half-citizens normally enjoyed rights of trade and marriage with the full citizens but were neither electors in Rome nor eligible for Roman magistracies. They had local self-government, when not deprived of it as a punishment. Half-citizenship gradually came to be considered a transitional stage toward full citizenship.

Outside the Roman state proper, there were the allies (*socii*) who were divided into two main groups. (*a*) The Latin allies gave their quota to the Roman army and could become Roman citizens by migrating to Rome. They had rights of intermarriage and trade with the Romans, but initially not among themselves. About 264 far the greater part of the Latin allies was concentrated in the Latin colonies; probably the majority of their citizens were either former Roman citizens who had given up their citizenship to become colonists, or their descendants. (*b*) The other allies (*civitates liberae*) were tied to Rome by more or less favourable treaties. They had to provide a fixed maximum of soldiers, commanded by Roman officers, or a fixed number of ships. They were allowed considerable autonomy in internal affairs and did not pay direct taxes to Rome. Unification of coinage, measures, and language developed slowly and apparently without much compulsion. The religious laws of Iguvium, some of which may have been written as late as the beginning of the 1st century B.C., are in the Umbrian language (*see* IGUVINE TABLES). Etruscan was still written (and spoken) at the end of the 1st century B.C.

Not all the territory controlled by the Romans was made up of cities. The tribal system remained important both in the north and in the south, in fact almost everywhere outside Latium, Etruria, Campania, and the coastal strip of Greek colonies. But directly or indirectly the Roman hegemony resulted in an increase in urban centres—not only *municipia* and *coloniae,* but marketplaces (*fora, conciliabula*). The Roman confederation included about 50,000 sq.mi., 10,000 of which were Roman territory and 5,000 Latin cities. The adult male Roman citizens (if that is the meaning of the formula *qui arma ferre possunt,* "those capable of bearing arms") numbered roughly 292,000 in 264. According to the famous list reported by Polybius (ii, 24; *cf.* F. W. Walbank, *A Historical Commentary on Polybius,* pp. 196 ff. [1957] for the difficulties of the text), in 225 the allies were required to provide Rome with a maximum of about 375,000 soldiers (and the *formula* did not include Italian Greeks and Bruttians).

The Roman system of ruling Italy was unusual in the ancient world in that it was not founded upon tributes or enslavement and was not justified in terms of racial or religious beliefs. It was basically a system of military obligations. The greater part of Italy was committed to participation whenever Rome had to defend itself or chose to attack. With a military force of that magnitude, the Romans were in a position to proceed indefinitely with their conquests, the more so because the Roman proletarians wanted land. They were an aggressive power, and Sicily became the next theatre for their ambitions. This ultimately led to the destruction of Carthage and to the extension of Roman military activities to Spain, to the Balkan Peninsula, and to Asia Minor. The roots of Roman imperialism are in the organization of the Italian Confederacy. (A. D. Mo.)

C. ROME AND THE MEDITERRANEAN STATES, 264–133 B.C.

1. Rome and the West, 264–201 B.C.—Before the 3rd century B.C., as before the first half of the 19th century A.D., Italy was "only a geographical expression"; the succeeding years in both periods witnessed the rapid growth of a united nation. The full development of the Italian Confederacy and the expulsion of Pyrrhus from Italy had demonstrated to the more civilized peoples of the Mediterranean world that a new power had arisen which would probably become involved in their affairs before much time had passed.

In particular the Greeks in the West, together with the Carthaginians who dominated the western end of the Mediterranean, soon became conscious of this fact. As early as 273 Ptolemy II of Egypt had established diplomatic relations and perhaps formal friendship (*amicitia;* not a treaty, a *foedus*) with Rome, the head of this powerful military and imperial state that was emerging. By the 4th century Greek writers, as Theopompus, Aristotle, and Theophrastus, knew of Rome's existence. Although Hieronymus of Cardia may have been the first Greek to sketch lightly the early history of Rome, Timaeus (who died after 264 B.C.) has rightly been called "the first historian of Rome"; he is the first known Greek writer to have appreciated the significance of Rome's rise to power.

First Punic War.—Carthage had long enjoyed treaties with Rome; the earliest known, which probably dated from the first year of the Roman republic as Polybius believed (508/507 by his reckoning), may well have renewed previously contacts made with Etruscan Rome.

Such agreements to limit the spheres of interest of the two parties would readily be renewed by Rome, which in the 5th and 4th centuries had no great interest in what went on outside Italy and had no objection to the merchants of Carthage dominating the western Mediterranean. But when Rome enrolled some of the Greek cities of south Italy as "naval allies," a new

situation was created, since these cities had trading interests such as the farmers of Latium had not enjoyed. Further, the Greek cities in Sicily, especially Syracuse, were being hard pressed by the Carthaginians in the west and centre of the island, while the Syracusans under King Hieron II were also challenged by some Italian mercenaries, who had seized Messana (Messina) *c.* 288 and were plundering northeastern Sicily. When these men, who called themselves Mamertines, were threatened by Hieron, the Carthaginians were unwilling to see Messana and control of the Sicilian Straits fall into his hands; they therefore put a Punic garrison into the town. The Mamertines, however, had appealed for help to the Romans, who themselves happened recently (270) to have expelled some other mercenaries from Rhegium (Reggio) in the toe of Italy.

Thus Rome and Carthage were brought face to face across the straits, and a crisis was precipitated by the appeal by Messana. Although some senators hesitated, the Roman people decided to accept the alliance, which would mean war with Carthage. Probably neither side deliberately planned war, but each was eager to deny to the other control of the straits. Yet if war had been avoided at this point, it would probably have come some time. Rome and Carthage were so different in race, culture, and religion, with different moral and material interests, that they would tend toward a clash when once the minor states lying between them had been either eliminated or assimilated. A balance of power, such as the Hellenistic monarchies in the east, with longer diplomatic experience and a common culture, tried to maintain, was more difficult to achieve in the west.

The military history of the war that followed (264–241) is treated in the article PUNIC WARS. Here it is sufficient to note that when the Romans, with Hieron, had occupied eastern Sicily and captured Agrigentum, they were faced with a decision that fundamentally affected their future history. If they decided to try to drive the Carthaginians completely out of Sicily, they would have to smash the Punic navy, and since they had virtually no ships of their own, they would have to build a fleet. However, they were practical as well as determined, and before long they had over 100 ships ready; even more surprising was the success that attended this fleet when it first went into action off Mylae (Milazzo) and defeated an enemy who had centuries of seafaring experience behind him (260).

After this victory the Romans in 256 boldly sent an expeditionary force to Africa to attack Carthage itself, but this daring adventure under Regulus ended in failure. The war dragged on in Sicily, where the Carthaginians were gradually confined to their western fortresses of Drepana (Trapani) and Lilybaeum (Marsala); when their fleet was finally defeated off the Aegadian (Aegates) Islands in 241, they capitulated. By the terms of the settlement they agreed to evacuate Sicily as well as to pay Rome an indemnity, but they remained an independent power.

The discipline of the citizen-militia of Rome, supported by the loyalty of the allies, had defeated an enemy whose armies consisted largely of mercenaries and subject peoples, officered by Carthaginians whom the home government sometimes regarded with suspicion. The struggle was, in the view of the historian Polybius, "the longest, most continuous and most severely contested war known to us in history."

First Two Roman Provinces.—The Romans thus found that they had Sicily on their hands. While leaving Hieron in control of his kingdom in the east end of the island, they made the rest into a *provincia,* which strictly meant the sphere in which a magistrate exercised his *imperium.* At first the administration was entrusted to a quaestor, but from *c.* 227 B.C., when the number of praetors was raised to four, a praetor was sent out each year as the governor to administer the island, which had to pay an annual tax to Rome in the form of a tithe on harvested crops. Thus when they acquired their first overseas province the Romans did not build up the nucleus of a new civil service: they used existing magistrates as administrators and farmed out the right to collect the taxes to the highest bidder in the province.

Meanwhile Carthage had crushed a desperate revolt of mercenaries in Africa in a struggle known as the Truceless War, but some others in Sardinia asked Rome for help. At first this was refused (239), but in the following year Rome decided to intervene and seized Sardinia; in reply to Carthaginian protests Rome threatened to renew the war, and so Carthage accepted the loss of the island. This unprincipled act embittered relations between the two powers just when they appeared to be improving. Rome's motive seems to have sprung from a passing fit of apprehension that if Sardinia remained in Punic control it might provide a base for an attack upon Italy if the Carthaginians ever turned to a war of revenge. In the event, such a war was made much more probable by Rome's aggressive folly. It took the Romans a few years to gain control of the mountainous interior, but in 227 Sardinia, together with the island of Corsica, was constituted as Rome's second province.

Expansion into Cisalpine Gaul.—But more serious trouble flared up nearer home. In 236 the northern frontier of Italy had been threatened by Gallic tribes, and ten years later a crisis arose when the Boii swept down into Italy and reached Etruria. Men remembered how Gallic tribes had sacked Rome in 390. After gaining a success near Clusium the Gauls began to retire with their booty northward along the coast of Etruria with a Roman consular army following behind.

Suddenly at Telamon they found their way barred by another Roman army which had been recalled from Sardinia and had landed north of them. The Romans won a decisive victory (225) and followed it up by deciding to reduce the northern plain of Italy, which they called Cisalpine Gaul (*see* GAUL, CISALPINE), in order to secure a peaceful frontier. The Boii were conquered by 224 and the Insubres, north of the Po, by 222. The consuls of 221 and 220 then carried through the reduction of the native tribes of Istria and thus secured the northeastern frontier toward the Julian Alps.

The way was now open for the spread of Roman culture in Cisalpine Gaul. This was hastened by the construction of the Via Flaminia from Rome to Ariminum (Rimini) in 220 by Gaius Flaminius (he had defeated the Insubres in 223), and by settling Latin colonies at Placentia (Piacenza) and Cremona in 218. Flaminius was also noted for his earlier quarrel with the Senate: as tribune in 232 he had carried a measure through the plebeian assembly, despite senatorial opposition, to distribute some land in north Italy (*ager Gallicus*) in allotments to poor Roman citizens. About this time also the Roman nobility had to allow a reform of the voting arrangements in the *comitia centuriata,* whereby more middle-class citizens would get a chance to exercise their vote. Shortly before this, in 241, two new tribes (Velina and Quirina) were created in Sabine and Picentine territory, thus bringing the total number of tribes to 35; thereafter the tribal system was always kept at this figure. Shortly afterward, in 218, Q. Claudius carried a measure which in effect forbade senators to engage in overseas trade. The Senate, however, despite the existence of some opposition, maintained control of policy, both domestic and foreign.

In Illyria and the Adriatic.—The attention of the Romans was also demanded in the Adriatic. The fact that under Queen Teuta the Illyrians had extended their kingdom southward to Acarnania would worry Rome less than the increasing scale on which they were practising piracy. In 229 Rome sent a force across the Adriatic and swiftly reduced them (228). In order to check future trouble and protect the Greek cities (as Dyrrachium and Apollonia) against the Illyrians, Rome established a small coastal strip north of Epirus as a protectorate; this was not a province, but Rome had declared an interest in this area and a desire that shipping should be unmolested. Envoys were sent to various parts of Greece, including Athens and Corinth, to explain Rome's conduct. Since the Greeks benefited no less than Italian merchants from the suppression of piracy, the Romans were well received; they were admitted by Corinth to the Isthmian Games and were thereby recognized as members of the Hellenic world.

Thus Rome came into official contact with Greece for the first time, but no similar diplomatic approach was made to the kingdom of Macedonia, which was probably annoyed by Roman intervention

in the Balkans—though without real cause, since the slowness with which Rome started the war and the terms imposed after it suggest that Rome was not deliberately cultivating an aggressive eastern policy. In 220 the Illyrians violated their treaty with Rome and thus provoked Roman intervention for a second time. In a whirlwind campaign the consuls of 219 reduced Illyria but made little change in the settlement, even though Illyria now enjoyed the support of Philip V, who had come to the throne of Macedonia in 221. They were in a hurry because of events in Spain.

Second Punic War.—During these years the Carthaginians had been busy building up an empire in Spain which would help to compensate for the loss of Sicily, Sardinia, and Corsica. The foundations of this dominion were laid by Hamilcar Barca (*q.v.*), who had shown great military ability as commander in Sicily during the last stages of the First Punic War. In 237 he crossed to Spain, with his nine-year-old son Hannibal, who had been made to swear eternal hatred to Rome. He quickly occupied southern and eastern Spain and managed to fob off a Roman protest, which no doubt had originated from Rome's ally Massilia, which disliked seeing the Punic frontier creeping so far north. When Hamilcar died in 229/228, he was succeeded by his son-in-law Hasdrubal, who established a new base at Carthago Nova (Cartagena). In 226/225 Hasdrubal made a treaty with the Romans, by which he agreed not to cross the Ebro River with an armed force, while the Romans possibly assured him that they would not interfere with his conquests south of the river.

A hundred miles south of the Ebro was an Iberian seaport, Saguntum, with which Rome at some point had made an alliance. If this was negotiated before the Ebro treaty, then presumably the alliance was virtually annulled by the agreement; if Rome accepted the alliance after 226, it infringed the spirit and perhaps the letter of the treaty. Thus when Hannibal, who succeeded Hasdrubal in 221, decided to regard the conquest of Spain as only preliminary to an attack upon Italy, he could use Saguntum to provoke Rome to action. In 219, therefore, when he was ready to challenge Rome, he attacked Saguntum. Disregarding Roman protests, he finally took it after an eight-month siege. This rendered a rupture with Rome inevitable, while it set his own hands free for further advance.

Even if he had not technically broken any agreement with Rome, Hannibal had deliberately provoked an incident which he knew would lead to war. For some time Barcid policy in Spain had been essentially defensive *vis à vis* Rome, but now Hannibal, ever mindful of Rome's previous seizure of Sardinia, moved to the offensive, and Rome accepted the challenge. Apart from the unprovoked seizure of Sardinia, Rome's policy after the First Punic War had not been deliberately aggressive; the Gallic wars were defensive in spirit, and the Illyrian campaigns were a necessary piece of police work. Rather, without pursuing deep-laid plans, Rome dealt with each situation as it arose. If Hannibal chose to question Roman interference in Spain, Rome was willing to face the consequences.

For details of the war that followed (218–201), *see* the articles PUNIC WARS; HANNIBAL; SCIPIO; FABIUS; etc. Hannibal's decision to leave his base in Spain, cross the Alps, and invade northern Italy was crowned with success, and culminated in a series of victories at Trebbia, Trasimene, and Cannae (*see* TREBBIA; TRASIMENO, LAGO; CANNAE). However, although he won over much of southern Italy, including Capua, he failed to break Rome's determination to fight on, and he failed to undermine the loyalty to Rome of the Latin cities and central Italy. Hence he had to cast his strategic net more widely. But this attempt too failed. His ally, Philip of Macedonia, achieved little; the revolt of Syracuse from Rome was soon crushed; the defeat of the Scipios in Spain failed to result in the expulsion of the Romans from the peninsula; Hannibal's movements and strength in Italy were checked by Fabius' strategy; the breakthrough to Italy by his brother Hasdrubal was foiled at the Metaurus. And finally Rome produced a military genius in Scipio Africanus, who drove the Carthaginians from Spain, persuaded his reluctant countrymen to allow him to invade Africa, won such success there that Hannibal was recalled from Italy to save Carthage, and finally defeated Hannibal at Zama.

By the terms of the peace Carthage was left as an independent state but had to give up everything outside an area roughly equivalent to that of modern Tunisia, to surrender the fleet, and to pay an indemnity over a period of 50 years. The Numidian prince Masinissa, whose cavalry had rendered Scipio invaluable service at Zama, was rewarded with an increase of territory. As Rome's ally, he stood watch over his neighbour Carthage, which by the treaty with Rome was forbidden to make war on anyone in Africa without the permission of Rome (and any war at all outside Africa).

Among the numerous factors that gave Rome the victory none was greater than the moral forces of a united people who were ready for any sacrifices in their will to conquer. These forces were soon to be blunted by ambition and avarice at home and by the contagious corruption of the eastern world into which Rome was quickly drawn. The effects of the war on Rome and Italy, on the constitution, on economic and social life, on religion and thought were profound, and it proved to be a turning point not only for them but for the history of the whole ancient world. After it no power arose which could endanger the existence of Rome. The Hellenistic monarchies of the east still flourished, but at Rome's touch they collapsed like a house of cards. German and other barbarian tribes in the north could threaten, and the emergent Parthian empire beyond the Euphrates might at times appear menacing, but for centuries such dangers were held at arms' length. Thus Rome became mistress of the fortunes of the civilized world and gradually introduced into that world a unity, unknown since the time of Alexander the Great, which was to last for five hundred years.

2. Rome and the West, 201–133 B.C.—*The Spanish Provinces.*—With the power of Carthage broken, Rome was faced by no other organized state in the west, but only by the native peoples of Spain, southern Gaul, Liguria, and the approaches of the Alps. The Romans had certainly not fought the Hannibalic War to gain Spain, but by ejecting the Carthaginians from the peninsula they found themselves in possession of the lower Ebro Valley, the east coast, and the rich Baetis (Guadalquivir) Valley. Beyond this area were the highland tribes of the interior. That the Romans finished by conquering them does not necessarily mean that they started with that intention. The need to preserve order on the borders of the more civilized south, whose rich resources Rome now began to exploit, may at least in part account for the long series of wars waged in Spain. For a few years after Scipio's conquest Spain was administered on a provisional basis, but in 197 the machinery of government was adapted by raising the number of praetors to six, and two provinces were established, Hither and Farther Spain (Hispania Citerior and Ulterior), each to be administered annually by a praetor.

Tribute was imposed in the form of a fixed tax (*stipendium*) to be paid in natural products or bullion. This later led to much extortion by unscrupulous Roman governors, unlike the fairer tithe system used in the province of Sicily, to which the former dominions of Hieron were added after his death. Sicily enjoyed peace and prosperity for many years until a slave war broke out in 135. Roman policy in Spain provoked a vast insurrection in 197 which started in the south and spread northward over the central highlands; it was checked, but not stamped out, by Cato in 195. The main resistance was in Celtiberia; it was undermined by the campaigns and wise settlement of Tiberius Sempronius Gracchus (father of the tribune of 133) in 179. Following the example of Scipio, who had left a settlement of his veterans at Italica near Seville in 206, Gracchus founded Graccuris on the upper Ebro, while later (in 168 or 151) Corduba was established in the south as another centre of Roman civilization.

In 154 war flared up farther west when the Lusitanians raided Roman territory; thanks to the brilliant guerrilla tactics of their leader, Viriathus, resistance was maintained until 139. In 138 D. Junius Brutus subdued Portugal up to the Douro and fortified Olisipo (Lisbon); a brief campaign farther north temporarily overawed the Callaici. Meantime the Celtiberians had made a second

unsuccessful bid for independence (153–151) and yet a third in 143. This last war, which centred on their capital, Numantia, dragged on for ten years and was marked, like many of these Spanish campaigns, by increasing Roman treachery and lack of military discipline.

At length a competent soldier was sent out, Scipio Aemilianus (the grandson, by adoption, of Scipio Africanus, the conqueror of Hannibal); he disciplined his troops, besieged Numantia (traces of his camps and walls of circumvallation survive, as do many other camps from these Spanish campaigns), and finally reduced the city by starvation; it surrendered in 133. Rome's control of Spain, apart from the Astures and Cantabri in the extreme northwest, was now complete, and the land quickly became one of the most prosperous and romanized parts of the Roman empire.

North Italy and the Balkans.—The Gallic tribes of the Po Valley, who had given Hannibal some support, attacked Placentia in 200 or 199. This led the Romans to tighten their grip on Cisalpine Gaul. By 191 the Boii, who had been supported by the Insubres and Cenomani, were defeated and many withdrew northward to settle in Bohemia. A Latin colony was established at Bononia (Bologna) in 189 and Roman colonies at Parma and Mutina (Modena) in 183, while the road system was extended by the Via Aemilia (built by Aemilius Lepidus, consul in 187; its name survives in the modern district of Emilia).

The Romans then dealt with the tribes on either side of Cisalpine Gaul. In the west Ligurian tribes held the mountains as far as southeastern France. In 201 Rome renewed earlier control of the ports of Luna (Spezia) and Genoa, but intermittent fighting with the Ligurians continued until 180; Luca probably received a Latin colony in 180 and Luna a Roman settlement in 177. After more disturbances in the 170s, the Romans in 154 pushed back the more westerly Oxybian Ligurians who raided the Massiliote ports of Antipolis (Antibes) and Nicaea (Nice); thereby they helped to secure their own communications with Spain.

East of Cisalpine Gaul lived the Veneti, who were loyal to Rome, and beyond them the Istrians at the head of the Adriatic. After founding a Latin colony at Aquileia (181), the Romans reduced the Istrians (178–177). Brief campaigns (157–155) against the Dalmatae and in Pannonia strengthened Roman control in the Adriatic. Thus Rome had asserted its authority from the Ligurians near Marseilles, round the sweep of the Alps to Istria, and thence down the western coast of the Balkans. Behind this shield Cisalpine Gaul could flourish.

Third Punic War.—Only one potential danger remained in the west, at least in the eyes of some Romans, and that was the reviving power of Carthage. Economic recovery from the Hannibalic War had been surprisingly speedy, but Carthage was constantly harassed by the aggressive pressure of Masinissa, who had built up Numidia into a powerful state. Goaded beyond endurance, the Carthaginians at last resisted him by force, thereby infringing their treaty of 201 with Rome. Cato was eager to seize the opportunity to destroy Carthage completely; other Romans advocated a more moderate policy, but the war party got the upper hand. It is unlikely that commercial interests affected the decision to any extent: hatred of their old enemy, combined perhaps with a passing mood of nervousness (such as affected the Roman attitude to Sardinia nearly a century earlier), led the Romans to declare war in 149. The Carthaginians surrendered and handed over quantities of war equipment, but when they learned of Rome's terms (the city must be destroyed, although the inhabitants could live anywhere beyond ten miles from the coast), they decided to fight on. The siege and destruction of Carthage in 146 in this Third Punic War are discussed in the article PUNIC WARS. Rome had acted perhaps with strict legality but certainly with great deceit in this final overthrow of its old enemy. The city was left in ruins, and most of the land that Carthage had controlled at the beginning of the war was organized as a new Roman province named Africa. Scipio Aemilianus, who had conducted the siege in its critical phase, returned to Rome and received, as his grandfather before him, the *cognomen* of Africanus. In the west Rome now had no possible rival.

3. Rome and the East, 200–188 B.C.—*Philip V.*—Rome's early contact with Greek cities during the First Illyrian War had been friendly (*see* above), but when Hannibal made an alliance with Philip V of Macedonia Rome had been forced to send an army to Greece to forestall a possible attack by Philip on Italy (214). Helped by Philip's unpopularity in Greece, the Romans made an alliance with the Aetolian League, which was soon joined by many other Greek states; the war dragged on until 205 when they negotiated terms with Philip in the Peace of Phoenice. The result of the war was that Rome had been drawn into formal relations with some Greek states and that many senators were resentful toward Philip or even suspicious of his ambition. But scarcely was the Hannibalic War over when the balance of power in the Hellenistic world was upset by the aggressions of Philip and Antiochus III, king of Syria. (*See* also ANTIOCHUS; MACEDONIA, KINGDOM OF.) These two monarchs took the opportunity offered by the accession of a child to the throne of Egypt to form a secret pact to seize Egypt's overseas possessions; they started in 202, and the complaints of many of Philip's victims were voiced on their behalf at Rome by an Aetolian embassy. The Senate, however, would not involve Rome in these affairs and rebuffed the ambassadors. Philip thereupon occupied the Cyclades and invaded the mainland of Ionia, clashing in naval engagements with the fleets of Rhodes and of Attalus of Pergamum, who appealed to Rome before the end of 201. The Senate then suddenly changed its mind and proposed that the Roman people, who alone could constitutionally declare war, should do so (March 200); but the people were war-weary and refused. The Senate thereupon sent an ultimatum to Philip, who was besieging Abydos, while one of his generals attacked Attica and thereby caused Athens also to appeal to Rome for help. At last in July the Senate persuaded the people to declare war on Philip, and an expeditionary force was sent to Greece.

Roman motives in undertaking this fresh war have been variously interpreted, since Rome was under no legal obligation to intervene; the appellant peoples were only "friends" (*amici*) and not treaty-bound allies (*socii*). Aggressive imperialism is not a probable cause; Rome was exhausted and in fact took no territory after the war was won. Since many Romans were at this time falling under the spell of Greek culture, it has been suggested that their policy was philhellenic, but an appreciation of earlier Greek achievements need not have led to sympathy for contemporary Greeks. Even if such sentiments contributed, a more basic explanation is still needed. Fear of Philip cannot have been strong, even if the desire to punish him for his past conduct was. The most probable explanation, and one that would account for the Senate's very unexpected change of policy, is that the Senate suddenly learned about the secret pact between the two monarchs. With Antiochus behind Philip the threat to Greece was serious, and Greece could be used as a hostile base. Rome was thus probably actuated by a defensive, rather than an aggressive, form of imperialism.

The war itself was quickly won. In 199 Rome gained the support of the Aetolians. In 198 T. Quinctius Flamininus (*q.v.*), having failed to persuade Philip to accept terms, drove him from the west to Tempe, overran Thessaly and central Greece, gained the support of the Achaean League, and in the following year decisively defeated him at Cynoscephalae (*q.v.*). Rome wisely allowed Philip to retain his kingdom of Macedonia but not his conquests nor his fleet. To have smashed Macedonia completely would have removed a barrier which protected Greece from the wilder tribes to the north and might also have encouraged Antiochus to intervene.

Amid scenes of great enthusiasm Flamininus proclaimed to the Greeks assembled at the Isthmian Games at Corinth in 196 that they were to be free, without garrisons (Philip had kept three in Greece) and without tribute, and to be governed by their own laws. Thus the Romans made clear that they had no intention of adding the administration of Greece to their responsibilities, and by 194 the Roman armies had left the country. They had, however, proclaimed their interest: all Greeks in Europe and Asia (where in fact Rome had no legal right to interfere) were to be free and autonomous. In a sense Rome thus extended a pro-

tectorate over the Greeks. A friendly Greece might seem the best guarantee against a revival of Macedonian power or any threat from Antiochus.

Antiochus III.—Meantime Antiochus, who had conquered Coele-Syria and Palestine (202–198), overran Asia Minor and crossing over to Europe established himself in Thrace, on which he had hereditary claims (196). In long diplomatic exchanges with Rome, whose fears were increased by the knowledge that Hannibal had sought refuge with Antiochus, misunderstandings prevented a settlement. In 192 Antiochus responded to the appeals of the Aetolians and sent a moderate force to Greece. He wanted the Romans to recognize him as an equal power and therefore was ready, if necessary, for a limited struggle; he did not accept Hannibal's alleged advice to invade Italy. Rome responded quickly. A force was again sent to Greece, and a single battle, at Thermopylae, was sufficient to drive Antiochus out of Greece (191). The Romans then decided for the first time to set foot in Asia, partly in the interests of their allies, Pergamum and Rhodes, and the Greek cities in Asia Minor. After the defeat of Antiochus' navy L. Scipio, the consul of 190, accompanied by his famous brother, Publius Africanus, led the legions of Rome into Asia. Again at one blow Antiochus was defeated, at Magnesia. The king was allowed by the subsequent Peace of Apamea to retain his throne, but he had to withdraw beyond the Taurus Mountains into Syria itself. Besides a heavy indemnity and the surrender of his fleet, he was forbidden to wage war in Europe or the Aegean. The terms in fact led to the rapid decline of Syria.

The Romans themselves had no intention of annexing territory in Asia, any more than in Greece. A great part of the land ceded by Antiochus was divided between Pergamum (where Eumenes II had succeeded Attalus) and Rhodes: Pergamum received Phrygia, Mysia, and Lydia, while the continental possessions of Rhodes were quadrupled by the gift of Caria and Lycia. Of the Greek cities on the western coast, those that had been subject to Antiochus were to be free, but those that had been tributary to Pergamum and those that had opposed Rome during the war were to pay tribute to Pergamum, though individual exceptions were made. Pergamum would act as a wedge between Syria and Macedonia, and at the same time would limit the ambition of the border states, Bithynia, Pontus, Cappadocia, and Galatia. The Galatians had in fact just been taught a sharp lesson by Manlius Vulso (189). They had been a constant menace to the Greek and native communities in Asia Minor, and so Manlius was sent to reduce them to submission. Unfortunately this useful piece of police work was spoiled by his cruelty and rapacity. Meantime his colleague Fulvius Nobilior had reduced the Aetolians, who had started fighting against Philip. Thus both Greece and Asia Minor were pacified, and the Romans, who had overthrown the two great Hellenistic monarchs in little more than a decade, withdrew, leaving not a single soldier behind. The Hellenistic world was left free to enjoy or abuse its liberty.

4. Greece, Macedonia, and the Hellenistic States, 188–146 B.C.—*Greece and Macedonia.*—Greece had been left free, but it certainly did not remain free from interstate quarrels and rivalries, which included a long struggle between Sparta and the Achaean League (189–181). Aggrieved parties tended to appeal to Rome, but Rome refused to go beyond diplomatic action and was often slow in enforcing its decisions. Under the strain of a bombardment of appeals from Greece the philhellenic protectorate policy of the Scipios and Flamininus began to weaken, especially as the political position of these men in Rome was undermined by the attacks of Cato, who wished Rome to wash its hands of Greek affairs. Thus Roman policy toward Greece hardened: the Senate began to support the pro-Roman at the expense of the nationalist patriotic parties, with less investigation into the rights or wrongs of a quarrel.

Meantime Philip of Macedonia, who had remained loyal to Rome during the war with Antiochus, was building up the power and resources of his kingdom to such an extent as to provoke Roman suspicions of his intentions. His son Perseus, who succeeded him in 179, soon decided to break with the Romans, who were forced to undertake military intervention in Greece once again in the Third Macedonian War (171–168/167). After three years of indecisive campaigns the Romans sent out an efficient commander, L. Aemilius Paulus, who finally defeated Perseus at Pydna (for the campaign *see* PYDNA, BATTLE OF). The settlement followed traditional Roman policy: freedom for Greece and Macedonia and no annexation of territory. Rome, however, could not allow the Macedonian monarchy to continue, since it had proved a threat to peace. Macedonia was therefore divided into four autonomous republics, which were to be separate political and economic units. They were to pay to Rome half what they had paid to their king in direct tax, as a substitute for a war indemnity. From Rome's point of view this might appear a generous settlement, but it did violence to the Macedonians' sense of nationhood.

Illyria also was divided into three districts. More brutal was Rome's treatment of Epirus and Greece. Epirus was systematically plundered (167). In Aetolia 500 Macedonian sympathizers were put to death, and 1,000 Achaeans were deported to Italy, among them the statesman and historian Polybius. Thus the Romans showed that they still preferred diplomacy to war, but the continued bickerings of the Greeks were undermining Rome's philhellenic policy and they had become more ruthless in their handling of the Greeks.

Hellenistic States and Provinces of Asia and Macedonia.—There was a similar hardening of Roman policy toward the Hellenistic states, details of which cannot be given here. Rhodes was punished for what the Senate regarded as too independent an attitude; it was deprived of its mainland possessions, while its commerce received a blow by Rome's encouragement of Delos as a competitor. Rome itself later paid the penalty through the increase of piracy which the Rhodian navy had hitherto helped to check. Rome's other friend, the kingdom of Pergamum, also became increasingly dependent upon Rome's favour until the death of Attalus III in 133; he bequeathed his kingdom to Rome, and the Romans accepted the legacy, converting Pergamum into the Roman province of Asia. Similarly the monarchies of Syria and Egypt, both of which were weakened by constant dynastic troubles, received short shrift from Rome when they tried to resume their mutual quarrels. Diplomatic pressure alone enabled Rome to keep them weak.

Rome's settlement of Greece was upset when a pretender, named Andriscus, tried to reestablish the Macedonian monarchy in 149. The next year a Roman army under Caecilius Metellus arrived and quickly ended Andriscus' career. Rome now finally reversed the policy of leaving Greece free and ungarrisoned: Macedonia was declared a Roman province. Trouble also flared up farther south, where Achaea tried to coerce Sparta, which appealed to Rome. Anti-Roman demonstrations in Corinth, where senatorial ambassadors were mobbed, led to quick reprisals. Rome's patience at last broke. An army under Metellus swept down from Macedonia and sacked Corinth (146), whose artistic treasures were shipped to Rome. Details of the settlement are obscure. The Achaean and all hostile leagues were temporarily dissolved, and timocracies (property-based oligarchies) replaced democracies in those cities that had been reduced in the war, but Greece was not made into a Roman province until a century later; the governor of Macedonia could supervise and maintain order there if necessary. There is little evidence that Roman policy was influenced by commercial, rather than by political motives. For over 50 years Greece had been left free to settle its own affairs, but had failed to maintain peace and order; these were now guaranteed by Rome in a settlement which did not necessarily bring prosperity or happiness.

Provincial Administration.—Thus Rome was now dominant in the eastern and western Mediterranean. In the west there were five provinces (Sicily, Corsica and Sardinia, the two Spains, and Africa) which had come into Roman possession as the result of the long struggles with Carthage, and to many parts of these regions Rome brought a higher type of civilization and government than they had known before. In the east Rome had been much slower to extend direct rule (to Macedonia in 146 and Asia in 133). Here an older and more advanced civilization flourished, and although Roman governors might bring order, the east remained Greek and not Roman in language, customs, and thought.

The conditions of administration of each province were defined in a charter (*lex provinciae*) which was granted when the province was formed; it could be supplemented with detailed regulations by the governor's edict. At first he was normally a praetor, but increasing use was made of promagistrates. In the provinces a few communities (*civitates foederatae* and *liberae*) enjoyed special privileges, such as greater autonomy and relief from taxation, but the majority were under direct control and subject to taxation, normally a fixed sum (but a tithe in Sicily and Asia). In theory the system was fair enough and at first worked well: thus Polybius in a well-known passage paid tribute to the incorruptibility of the average Roman governor, whom he contrasts with corrupt Greek statesmen. But in his day abuses were beginning to creep in, although the establishment in 149 of a permanent court in Rome to try cases of extortion at least testifies to a desire to maintain high standards.

Italian Allies.—Here too may be mentioned a gradual deterioration of Rome's relations with the allies in Italy during the first half of the 2nd century. The Senate did not deliberately seek to undermine their internal independence, but Roman control gradually overshadowed the local authorities until finally they became part of the machinery worked by the central government. Thus Rome tended to intervene when a matter, such as the Bacchanalian "conspiracy" in 186 (*see* BACCHANALIA), affected the interests of Italy as a whole; and on occasion Roman magistrates acted arrogantly in allied cities. In particular, the more privileged Latin allies were treated with less generosity than earlier, and they began to feel that the overseas empire was being exploited in the interests of Rome rather than of Italy.

5. Political, Social, and Economic Developments, 200–133 B.C.—*Constitution.*—In his classic description of the Roman constitution Polybius concluded that it contained three nicely balanced principles: monarchy represented by the consuls, aristocracy by the Senate, and democracy by the people. In practice, however, the Senate had gained general control: in effect it *was* the government. It controlled the chief military commands, finance, and foreign policy; it set up judicial commissions of inquiry and it supplied the jury for the first permanent court (*quaestio perpetua*) in 149. Only occasionally did the sovereign people intervene, as when Flaminius carried a bill of which the Senate disapproved in 232. So also in general it controlled the magistrates, together with the tribunes, who gained the right to convoke the Senate and became in effect magistrates of the people (*populus*) rather than officers of the plebs; increasingly they acted in the interests of the Senate.

The Senate itself had gained great prestige by its conduct of the Hannibalic War, but war conditions had caused constitutional breakdowns. Thus, the need for continuity of command led to the irregular election of men to a second consulship within ten years, while Scipio had been invested by the people with a proconsular command when he was a *privatus*, not holding any magistracy. Such irregular commands might have encouraged ambitious soldiers to challenge the central government; to guard against such a potential threat a *Lex Villia Annalis* in 180 regulated the order in which magistracies must be held (*cursus honorum*) and made sure that no one could reach the consulship before he was 34; soon afterward (in 150?) the minimum age was raised to 42.

Rome was in practice an oligarchy; the magistrates and people were controlled by the Senate, the stronghold of the nobility. These nobles were now a mixed body of patricians and plebeians, drawn from a limited number of families and as exclusive as the old patriciate had been; ten families supplied half the 200-odd consuls between 233 and 133. *Nobilitas* was confined to members of those families which had held the consulship; the extremely few men outside this closed circle who did succeed in winning the consulship automatically ennobled their families (Cato was the outstanding example of these *novi homines* ["new men"]). It was this inner circle of nobles that in practice controlled the Senate, and they were enabled to exercise their power through patronage. Most of the nobles had numerous clients (*clientes*) whose personal, economic, social, legal, or political interests they fostered. Political relations were essentially personal, and through patronage the nobles influenced the elections, which gave them control of the Senate, where the influence of the higher magistrates was paramount. The nobility tended to split into groups, based on families or *gentes*, which often formed political alliances (*amicitiae*), sometimes strengthened by intermarriage. These groups did not develop into political parties in the modern sense, but contended in keen rivalry with one another for the higher magistracies.

Optimates and Populares.—Such struggles may have become slightly less fierce by 133 when the nobility is found divided into Optimates and Populares. These political catchwords have sometimes wrongly been equated with "conservatives" and "democrats." The Optimates were the dominant group in the Senate. They blocked the wishes of the others, who were thus forced to seek tribunician support for their measures in the tribal assembly and hence were labeled Populares, "demagogues," by their opponents. The two groups differed therefore chiefly in their methods: the Optimates tried to uphold the oligarchy, the Populares sought popular support against the dominant oligarchy, either in the interests of the people themselves or in furtherance of their own personal ambitions. Finally, it is well to remember that the Senate's authority was based on custom and consent rather than upon law. It had no legal control over the people or magistrates: it gave, but could not enforce, advice. Until 133 B.C. any challenge to its authority was little more than a pinprick, but thereafter more deadly blows were struck, first by Populares and later by the army commanders from the provinces.

Influence of Greek and Oriental Culture.—The social, economic, and intellectual background of the Roman nobility, and indeed of Roman society as a whole, was changing rapidly, chiefly through the impact of the Greek world upon Roman thought and the *mos maiorum* ("ancestral custom"). Private tutors and teachers in schools taught the Greek language and literature, so that by 133 most educated Romans were bilingual. National consciousness, and not least an interest in Rome's legendary Trojan origin, fostered the development of Latin literature. Livius Andronicus (a Greek from Tarentum) translated the *Odyssey* into Latin; stimulated by Greek examples, Naevius and Ennius created an epic poetry. Plautus, Terence, and others produced Greek comedies in Roman form; dramatists, as Ennius, adapted Greek tragedies for the Roman stage. The satirist Lucilius developed a new literary *genre*. Roman senators, as Fabius Pictor, wrote histories of Rome in Greek, partly to justify Roman policy to the Greek world; and Cato soon followed with history written in Latin. (*See* LATIN LITERATURE.) Greek architecture influenced the construction of public buildings and private houses in 2nd-century Rome, while Greek statues and painting were increasingly admired.

Changes in religion and thought were equally profound. Greek and eastern cults, as of Phrygian Cybele (Magna Mater) and the Greek wine-god Dionysus (Bacchus), became popular in Italy. Greek philosophy, especially Stoicism and Epicureanism, although resisted at first by the old-fashioned Romans like Cato who feared it would undermine the *mos maiorum*, was increasingly studied in Rome. At first men like Scipio Africanus and Flamininus had encouraged the spread of Greek ideas and ways, while later Scipio Aemilianus gathered around himself a circle of intellectuals who included Laelius, Panaetius, Polybius, Terence, and Lucilius (*qq.v.*) They tried to blend together the best elements of Greek and Roman life.

A more material import from the east was the wealth that derived from war booty, profitable administration, and trade. In consequence many Romans enjoyed more luxurious lives, and sumptuary laws did little to check the growing extravagance. A contemporary, Calpurnius Piso (consul later, in 133), dated the overthrow of Roman modesty to the year 154. A healthy family life, the very basis of early Roman society, declined. There was greater freedom of divorce, an increasing disinclination to marry, greater emancipation of women, together with a demand for more public festivals, games, and gladiatorial shows; and above all, slavery increased.

Growth of the Equestrian Order.—The uniting of so much of the Mediterranean world under one hand naturally stimulated com-

merce and thus increased the importance of the business classes, who were known as the equestrian order. This comprised the original 18 *centuriae* of *equites* (younger nobles who served originally as cavalry) and a wider group of men whose property qualification would have entitled them to this status. Socially some of these men might come from the same class as the senators, but politically there was a great gulf. The *equites* were excluded from the Senate and a public career; instead they turned to business, as individuals and in companies, and became bankers, moneylenders, and traders. They also received contracts from the censors for carrying out some public works and collecting certain taxes, and they took over the operation of mines in Spain and Macedonia. They also helped to supply the Roman armies with equipment. Thus a new and important element was emerging in Roman society, which undertook many of the duties that the state itself failed to perform through the creation of an official machinery. There was some friction between them and the Senate, but this did not become serious until later.

Land System.—The wealth which these businessmen helped to create had many repercussions besides the social effects already noted and made the lot of the small farmer in Italy much harder. Men coming back to Italy, enriched by the wars or by trade, invested their capital in land, which now became an object of speculation. Landowners often ceased to be farmers and entrusted their estates to bailiffs to be run for profit. At the same time the wars increased the number of slaves, and servile labour began to oust free on the bigger estates in many parts of Italy. Thus peasant husbandry gave place to large estates (*latifundia*) worked by slaves and devoted to pasturage. Mixed farming on a moderate scale was still profitable, but the small farmer was hard pressed, and many abandoned their land to larger proprietors and drifted to Rome and other cities where they were often unemployed. This decline is reflected in the census figures, which rose until 164 B.C. and then regularly fell. The process was accelerated by the way in which the state disposed of the land that it had acquired in Italy, the *ager publicus populi Romani*. The less fertile parts had been let to squatters (*possessores*), who paid a nominal rent, but this was not enforced strictly since the state created no adequate machinery to collect it, and men came to regard the land as their own. The amount of such land that any individual might hold was limited (to 500 *iugera* or about 300 ac. in the 2nd century, and probably as early as 367). But in practice this limitation had been widely disregarded, not least because many senators, as large landowners, would benefit. The system, however, involved the possibility that, if the plight of the small farmers got very bad and they could find a leader to champion their cause, a demand might be made to enforce the law strictly and redistribute some of this "public land." Scipio's friend Laelius made such a proposal, but dropped it when he found the strength of the opposition. It was left to Tiberius Gracchus to tackle the problem in 133.

D. The Fall of the Republic, 133–31 B.C.

1. The Challenge of the Gracchi.—The first serious challenge to the senatorial government came from Tiberius Sempronius Gracchus (*q.v.*), tribune in 133. When he proposed an agrarian bill, under which the "public land" held in excess of the legal limit should be taken back by the state for distribution, he had the support of several leading senators, but the constitutional methods that he adopted soon lost him this backing. Despairing of winning full senatorial support, Tiberius took his measure straight to the *concilium plebis*, where a fellow tribune, M. Octavius, vetoed it in the interests of the Senate. He then took the extreme step of getting the people to vote for the deposition of Octavius. He was thus able to carry his measure, and a commission of three men with judicial powers was set up to carry out the redistribution of the land. This was to be divided into small allotments for Roman citizens in economic difficulties. Whether Tiberius' primary concern was to cope with the unemployment problem in the cities or, as is more likely, to try to reestablish the small farmers in Italy (the yeomen on whom the army had depended) may remain uncertain, but these are really only two aspects of the same basic problem.

In order to give his settlers a start Tiberius proposed to divert to this purpose some of the legacy of Attalus of Pergamum, who had just died and left his kingdom to Rome (*see* above). The Senate strongly resented this interference in financial and foreign affairs, which had been their preserve. When Gracchus decided on the unusual step of standing for a second tribunate, disturbances broke out at the elections, and some senators resorted to force and clubbed or stoned to death Gracchus and 300 of his followers. Thus after nearly 400 years blood was again shed in Rome in civil strife. There is no doubt that Tiberius was a sincere reformer, but his methods had antagonized the Senate. His appeal to the sovereign people was legitimate, but it would be unwise to suggest that the urban mob which attended the *concilium* was sufficiently responsible and experienced to offer an alternative body to the Senate or that a prolonged tribunate might not smack of demagogy. Neither of these potential aspects was probably uppermost in Tiberius' mind, but they might well have been the ultimate consequence of such action as he took.

The Senate allowed the land commission to continue its work, but difficulties arose, especially where the interests of the Latin and Italian allies who had rented public land were concerned. Scipio Aemilianus took some action to help, but he died in 129. The allies became increasingly discontented, and their cause was taken up by M. Fulvius Flaccus, who in 125 boldly proposed that all allies who wished should receive Roman citizenship and the others should be given the right of appeal against Roman magistrates. This statesmanlike proposal failed, and Fregellae revolted but was quickly reduced; a widespread allied revolt was averted for another 35 years. The cause of the allies, however, was championed by Gaius Gracchus (tribune in 123 and reelected 122), but he could not hope to tackle this thorny question until he had built up firm political support. This he did on a much wider basis than his brother had (*see* Gracchus, Gaius Sempronius).

Gaius won popular support by continuing his brother's agrarian work, by a law to provide grain at less than the market price, and by proposing to found some colonies in southern Italy and even at Carthage (Junonia). He gained the support of the *equites* by making them, instead of the senators, the jurymen to deal with cases arising from extortion in the provinces, and by giving them the right to bid for collecting the taxes of the new province of Asia. The Senate tried to thwart him by putting up another tribune, M. Livius Drusus (*q.v.*), to outbid him in popular favour with some specious proposals. Finally, Gaius proposed that the Latins should receive full enfranchisement and that the rest of the allies should get Latin rights (*see* Latin Rights). In this he failed, and he also failed to secure reelection to a third tribunate. Some disturbances ensued and the Senate for the first time passed "the last decree" (*senatus consultum ultimum*), which urged the consuls to defend the state by virtue of their *imperium*. The consul L. Opimius took to arms: Gaius, Flaccus, and many followers were killed, and others were executed without trial. Although Opimius was later prosecuted, he was acquitted.

The Senate, ruthless on this front, was more conciliatory toward the land commission, which was allowed to continue its work until 119. The whole question was wound up in 111, when all grants of land, which had been made alienable in 121, were made the private property of their occupiers, and the system of *possessio* was abolished. Thus the work of the Gracchi resulted in the setting up of many small farmers and some colonists, even though economic difficulties remained. The allies were more embittered, the *equites* more conscious of their political powers, and the people more ready to support a Popularis. Above all, the weakness of the Senate was revealed, and so the Gracchi, however unwillingly, precipitated the revolution that within a century overthrew the republic.

2. Marius, 119–100 B.C.—The rise of Marius to a political career was helped by the Caecilii Metelli, who dominated the Roman political scene for a decade (119–109). In 123 Q. Metellus crushed piracy in the Balearic Islands, where two colonies of Romans were established at Palma and Pollentia in Majorca. This helped to secure the sea route to Spain, but Rome was also concerned about the land route through southern Gaul. At the re-

ALINARI

(LEFT) MARIUS; (RIGHT) SULLA. IN THE VATICAN MUSEUMS

quest of Massilia in 125 Rome had sent a force against the Saluvii, Ligurians, and Vocontii. This provoked the hostility of the Allobroges and Arverni farther north; after they were defeated in 121, the Senate decided to annex southern Gaul (Provence) as a province (Gallia Transalpina or, later, Narbonensis; *see* GAUL). In 118 a proposal to establish a Roman colony at Narbo (Narbonne) led to a clash between the Senate and *equites,* since both strategic and economic interests were involved; the *equites* got their way, thus emphasizing their increasing political influence. A serious threat to the security of the frontiers arose when the Cimbri and Teutones, Germanic tribes, started moving in the search for fresh homes and defeated a Roman army at Noreia (113); for the moment, however, they turned westward through Switzerland. The need to guard the frontiers of Macedonia led to much fighting against the Thracian Scordisci and Taurisci, in which various Metelli and their political ally M. Aemilius Scaurus (*q.v.*) took a leading part (between 119 and 107).

At home the Metelli soon found that their "client" Marius (*q.v.*) would not accept their patronage for long; as tribune in 119 he took an independent line. He came of a good municipal family from near Arpinum, and thus, not being of senatorial descent, he had little chance of winning high office, but the traditional portrait of him as a rough uneducated soldier is scarcely true. He certainly had soldierly qualities and determination, and he knew how to use men for his own advantage. After managing to reach the praetorship in 115, he probably devoted some time to business interests and contacts with the *equites;* he also married into the noble family of the Julii. This no doubt helped his political advancement, because his aim was less to challenge the power of the Senate than to win an influential place within it: the *novus homo* wanted the consulship and recognition.

His chance came in the Jugurthine War. When Micipsa, king of Numidia, died in 118, his nephew Jugurtha (*q.v.*) quickly murdered Micipsa's two sons and seized the throne. The further murder of many Italian merchants in Cirta (Constantine, Algeria) angered the people and *equites* in Rome who demanded action. In 112 war was declared upon Jugurtha. Charges of senatorial inefficiency or corruption in the conduct of its initial stages were investigated by a special court set up at the instigation of a tribune, Mamilius, and the Senate sent out a competent soldier, Q. Metellus. His campaigns (109–108), although successful, did not lead to Jugurtha's capture or defeat, and the friends of Marius, who was himself serving on Metellus' staff, began to agitate in Rome on his behalf.

Thus with popular and equestrian support Marius won the consulship of 107. Two important developments followed. First, the people, disregarding the Senate's traditional right to assign the provincial commands, rejected its decision to prolong Metellus' command and appointed Marius to succeed him. Second, in order to secure an adequate and loyal army Marius set aside the rule that it should be recruited exclusively from the five property classes, and enrolled volunteers from those who lacked the necessary property qualifications (*capite censi* or *proletarii*). With this force Marius wore down Jugurtha's strength (107–105), and finally his quaestor, L. Cornelius Sulla, secured the handing over of Jugurtha by his former ally, Bocchus of Mauretania.

A more serious danger now threatened: Roman armies had been defeated in the Garonne Valley and at Arausio (Orange) in the Rhône Valley, and the Cimbri and Teutones were moving on northern Italy. Marius was elected irregularly to a second consulship for 104 and entrusted by the people with the northern command. As the enemy were slow to advance, he had time to train his army in those new methods and organization that gave the legions their predominance for the next two or three centuries. Elected to the consulship each year until 100, he defeated the Teutones at Aquae Sextiae (102) and the Cimbri at Vercellae (101); he returned to Rome a popular hero and the leader of a devoted army.

Meantime Saturninus, who was tribune in 103 and again in 100, carried some popular measures in the interests of Marius, the people, and the *equites* against the Optimates: a grain bill, a measure to provide land for Marius' veterans in Africa and elsewhere, and the establishment of a court to try cases of treason (*quaestio de maiestate*) which was aimed particularly at senatorial generals who had lately been disgraced. Trouble flared up during Marius' sixth consulship (100) when Saturninus was helped by some of Marius' veterans to get his measures carried, and when a rival candidate of his ally Glaucia, who was standing illegally for the consulship of 99, was killed (Saturninus himself had secured a third tribunate for 99). When the Senate passed the *senatus consultum ultimum,* Marius deserted his allies and rallied to the side of law and order. Saturninus and Glaucia, who had seized the Capitol, were lynched. Marius, who was not prepared to go further and use the army to gain power, was discredited. The authority of the nobility had triumphed over the turbulent demagogues, who might claim to be following the tradition of the Gracchi but in fact were actuated merely by personal ambition, and over a *novus homo* who had become an army commander. Future generals were to show greater political insight than Marius but less sense of responsibility and loyalty to the Senate and constitution.

3. The Social War and Sulla's Dictatorship.—The extreme actions of the Populares caused the senatorial and equestrian orders to move closer together, but any such *concordia ordinum* during the 90s was weakened by scandals in the lawcourts, such as the condemnation by an equestrian jury of P. Rutilius Rufus, who had protected the provincials of Asia from the exactions of the equestrian tax gatherers (92). More serious still was the selfish attitude of Senate and people toward the Italian question. The consuls of 95 tactlessly removed from the citizen list some allies who were wrongly registered, and the allies' cause was taken up by the younger M. Livius Drusus (*q.v.*), tribune in 91, who was an aristocrat enlightened enough to try to tackle some of the urgent problems of the day. He gained popular support by measures to provide allotments, colonies, and cheap grain, and then turned to the problem of the lawcourts which had so embittered relations between the two orders. He probably proposed that the courts should be shared between them; it is uncertain whether he also wished to add 300 *equites* to the Senate. This compromise pleased few, and when he was known to be supporting allied claims to citizenship he also lost favour with the Roman people, who were not willing to share their privileges. The Senate then declared his legislation invalid on technical grounds, and when soon afterward he was murdered the allies (*socii*) turned to war (hence called the Social War). Denied Roman franchise, they fought for independence.

The Social War.—The peoples of the hills of central Italy formed the heart of the uprising, the Marsi in the north and the Samnites in the south. Neither the Latin colonies nor Etruria and Umbria joined in. The Italians established their headquarters at Corfinium,

which they renamed Italia, created a senate and officers, and issued a special coinage; soon they had 100,000 men in the field. In 90 Roman armies were defeated in the northern sector, although Marius, who had not been given the command, managed to retrieve the situation, while in the south the Italians were equally successful and burst into southern Campania. Only by political concession could Rome hope to check the revolt: by a *Lex Julia* Roman citizenship was granted to all Italians who had remained loyal and probably also to all who were ready to lay down their arms. In 89 both consuls served in the north, where Pompeius Strabo inflicted a decisive defeat on the forces that were trying to break through to Umbria and Etruria; he then captured Asculum, where the revolt had started. In the south, with Sulla in command (Marius had been passed by), the Romans also gained successes.

The back of the revolt was now broken, although some resistance continued among the Samnites for a short time. Further legislation helped: a *Lex Plautia Papiria* in 89 supplemented the *Lex Julia*, a law (*Lex Calpurnia?*) regulated the municipal organization of the communities that now entered the Roman state, while a *Lex Pompeia* of Strabo dealt with Cisalpine Gaul (probably granting citizenship to all Latin colonies, not only to the Cispadanes south of the Po, and Latin rights to the rest, not merely to the Transpadanes). But even so the newly enfranchised citizens still had a grievance: through the way they were enrolled in the tribes they were not given equal voting rights with the old citizens. Thus, at a terrible cost in human lives in a life-and-death struggle, the political unification of Italy was achieved, and Romans and Italians, hitherto linked by alliance, could now learn to become a single nation.

Civil Struggles, 88–82, and the First Mithradatic War.—There were still a few troubles abroad. In Sicily a slave war (104–101) lasted no longer than the earlier one led by Eunus (135–132), while attempts by M. Antonius to check piracy in the eastern Mediterranean (102–100) were ineffective. More serious was the threat from Mithradates (*q.v.*) VI, king of Pontus, who had profited by Rome's absorption in the Social War to invade Bithynia and Cappadocia in alliance with Tigranes of Armenia. Diplomatic pressure by Rome led him to withdraw, but in 88 he swept through the province of Asia, promising freedom to the Greek cities and massacring 80,000 Italian businessmen and their families. He then accepted an invitation from Athens to invade Greece, where a Pontic force arrived before the end of the year.

This critical position led to political differences in Rome, where a tribune of 88, P. Sulpicius Rufus (*q.v.*), was trying to secure a fair deal for the Italians and their proper distribution in the tribes. In order to gain wider support Sulpicius was prepared to seek it from the people, the *equites*, and an embittered Marius. He therefore proposed that the command against Mithradates should be transferred to Marius from Sulla (consul in 88), to whom it had already been assigned. Disturbances in Rome forced Sulla to flee; he joined his army in Campania, where he learned that Sulpicius' measures had been passed. He then took a momentous decision: he appealed to his troops and led six legions against Rome, which he captured in street fighting since Marius and Sulpicius had no troops. The latter were declared outlaws. Marius escaped, but Sulpicius, a tribune in office, was killed and his legislation was annulled.

Sulla rushed some measures through the *comitia* in order to strengthen the Senate and then crossed to Greece, where he defeated the armies of Mithradates at Chaeronea and Orchomenos (86). Meantime L. Cornelius Cinna (*q.v.*), a consul of 87, tried to reintroduce Sulpicius' measure for the new citizens, but was driven from Rome by his colleague Gnaeus Octavius and declared a public enemy. He then raised forces and was joined by Marius, who returned from his refuge in Africa; together they captured Rome and declared themselves consuls for 86. Marius gratified his thirst for revenge by a terrible massacre, but luckily he died near the beginning of his seventh consulship, leaving Cinna in control for the next three years. Cinna, who was reelected consul each year, showed considerable moderation, and in particular saw to it that at last the new citizens were fairly distributed throughout the 35 tribes. But he had also had Sulla declared an outlaw, thereby ensuring and emphasizing that Sulla and his army stood against the republic.

Neither L. Valerius Flaccus, Cinna's consular colleague in 86, who was sent against Mithradates, nor Gaius Flavius Fimbria, who murdered Flaccus and succeeded to his command, moved against Sulla, who reached terms with Mithradates by the Peace of Dardanus (85). The king was to withdraw to Pontus and pay an indemnity, while Sulla imposed a severe settlement on Asia which crushed the province financially. He then prepared to return to Italy; Cinna, who tried to save Italy from further fighting, was unable to persuade his troops to cross to Greece and was killed by them (84). Rome was left in the hands of his colleague Gnaeus Carbo. When Sulla finally landed at Brundisium (83) he was joined by several younger men, among them M. Licinius Crassus and Strabo's son Gnaeus Pompeius (Pompey), who raised three legions in Picenum for Sulla. In a brief civil war (83–82) Sulla beat down all opposition and after the Battle of the Colline Gate at Rome itself, where he defeated Carbo and his Samnite allies, he was master of the city. Q. Sertorius had withdrawn to Spain to fight on, but the "Marians" who fled to Sicily and Africa were defeated by Pompey, whom Sulla sent against them. Massacres and proscriptions followed. Sulla confiscated the estates of individual opponents and the land of Italian cities that had taken the other side; he needed the land for his veterans and settled about 120,000 men in over ten colonies in Italy. By a vote of the *comitia centuriata* Sulla then became dictator for redrafting the constitution.

Sulla's Dictatorship.—Though Sulla's early career had not followed an orthodox Optimate pattern and he was not the fervent champion of the Senate that he has sometimes been called, he now probably realized that peace and order could be restored only if the Senate regained something of its old authority. The purpose of the reforms that he introduced was therefore probably to support the Senate and the Optimates against the Populares. He added 300 equestrians to the Senate and secured its future membership by making the quaestorship the automatic qualification. He managed to do without the censorship and controlled the other magistracies by means of the *cursus honorum;* in particular, he clipped the wings of the tribunate, making the office a dead end. He checked equestrian influence in the provinces by restoring the lawcourts in Rome to the senators. To check provincial governors he developed the law of treason (*maiestas*). He raised the number of praetors to eight and arranged that provincial governorships should normally be held by promagistrates after their year of office in Rome. His most enduring reform was his reorganization and development of the permanent courts in Rome to cover the chief crimes.

Having completed his arrangements Sulla resigned his dictatorship (79) and retired into private life, though death soon cut this short. He had given the senatorial nobility another chance, and though he must have known the weaknesses of his settlement (especially the potential threat of an ambitious and ruthless army commander) he may well have thought that it would function if sufficient men of good will tried to work it. That would be the responsibility of the younger generation, including many of his own officers. In the event, two of them, Pompey and Crassus, destroyed his work within ten years.

4. The Rise of Pompey.—The reinforced senatorial government was challenged even before Sulla's death by M. Aemilius Lepidus (*q.v.*), consul in 78, who produced a Popularis program that included the restoration of full powers to the tribunate. Availing himself of the social and economic discontent arising from quarrels between Sulla's colonists and the farmers they had dispossessed, Lepidus led a counterrevolution. After the passing of the *senatus consultum ultimum* his forces were crushed with the help of Pompey, to whom the Senate unwisely granted special *imperium* (77). Pompey then demanded that he should be sent to deal with Sertorius, who was still resisting the senatorial forces under Q. Metellus in Spain (*see* SERTORIUS, QUINTUS). The Senate capitulated and granted the young man proconsular *imperium* as the colleague of Metellus. After some early setbacks

Pompey ultimately defeated Sertorius, who claimed to be fighting not against Rome but against Sulla's illegal government (73).

Meantime Nicomedes IV of Bithynia died and bequeathed his kingdom to Rome. The Senate's acceptance, which changed the balance of power in Asia Minor, provoked Mithradates to invade Bithynia; he was driven out by Lucullus (*q.v.*) in 74–73 at the beginning of what proved to be a long struggle. In the eastern Mediterranean the well-organized fleets of the pirates, which were said to amount to 1,000 ships, were becoming more menacing, and M. Antonius (praetor in 74) was given a special proconsular command to deal with them. As part of this drive against the pirates, Cyrene, which had been bequeathed to Rome on the death of its ruler more than 20 years earlier, was declared a Roman province in 74. In Italy itself a slave rising, led by Spartacus (*q.v.*), reached menacing proportions, with the defeat of even consular armies, until it was crushed by Crassus (73–71). Pompey, on his way back from Spain, intercepted some of the slaves who were trying to escape and claimed his share of credit for Crassus' achievement.

Thus both Pompey and Crassus approached Rome with their armies. Both wanted the consulship for 70, though Pompey had not held any of the qualifying offices. But the Senate was discredited by its weak administration of recent years, combined with some scandals in the courts, and was in no way able to resist the demand of the two successful generals. Thus Pompey and Crassus, both old supporters of Sulla, gained office and proceeded to abolish most of what remained of his constitution. The tribunes regained all their former powers, the censorship was revived, and the courts were transferred from senators to a mixed panel of senators, *equites,* and *tribuni aerarii* (the next wealthiest class). The year 70 was also marked by Cicero's prosecution of Verres (*q.v.*). This had the effect of exposing corruption in the provinces, while Cicero's success made him Rome's leading advocate. At the end of the year neither Pompey nor Crassus took a proconsular command but both retired into private life, which for Crassus largely meant moneymaking.

Further opportunities soon came to Pompey. The pirate menace had become so great that exceptional measures had to be taken, and a tribune named Gabinius, now freed from the shackles that Sulla had imposed on the office, proposed that Pompey be given a great command in the Mediterranean and around its coasts, for three years, with considerable forces to crush the pirates. Pompey with great efficiency carried out the task in three months and thus put an end to a long-standing scandal of Rome's administration.

Meanwhile Lucullus had successfully driven Mithradates from his kingdom of Pontus and then invaded Armenia, where Mithradates had taken refuge with his son-in-law Tigranes. After defeating Tigranes near his capital, Tigranocerta (69), Lucullus then defeated the two kings in battle (68). But his men were getting restless, and his political opponents in Rome, especially the *equites,* were agitating for his recall. In 66, therefore, another tribune, Manilius, carried a measure, which was supported by Cicero, to give the Mithradatic command to Pompey. With much larger forces than Lucullus had commanded, Pompey advanced against Mithradates, who in the meantime had recovered his kingdom, and defeated him at Nicopolis (66) and forced the surrender of Tigranes. Before long Mithradates killed himself (63). His career had shown that the Hellenistic world, which he had failed to free from Rome, must come under one rule and that Rome's political horizon must now reach to the Euphrates.

Meanwhile Pompey had marched through the Caucasus area and then southward, where he reestablished order in Syria and Palestine and captured Jerusalem (64–63). He then resettled the nearer east. The chief change was Rome's annexation of Syria as a province, with the enlargement of Bithynia and Cilicia. Behind this line of Roman provinces, with outposts at Crete and (later in 58) at Cyprus, the various client-kingdoms in Asia Minor were reorganized; here Pompey, like another Alexander, encouraged city life, founding or restoring many cities with Greek institutions. His reorganization of the east gave reasonable security against the Parthian empire beyond the Euphrates; it also vastly enriched the Roman treasury and enhanced the personal prestige and following of Pompeius Magnus.

5. Pompey and Caesar.—In Rome Crassus, supported by Julius Caesar, intrigued to build up his political power against the return of Pompey. Caesar (*q.v.*), a noble who drew close to the Populares, had supported Pompey in 67 and gained the aedileship for 65, doubtless with the help of Crassus' wealth. After an abortive minor "conspiracy" by Catiline (*q.v.*), a bankrupt noble, at the beginning of 65, Crassus sought power in Spain, Transpadane Gaul (between the Po and the Alps), and Egypt. As censor he wished to grant full citizenship to the Transpadanes but was thwarted by his Optimate colleague Catulus. A proposal that Egypt (where the claim of Ptolemy XII Auletes to the throne was questioned) should be annexed was also defeated by the Optimates, supported by Cicero, who was protecting Pompey's interests in Rome. At the end of 64 a tribune, P. Servilius Rullus, was put up to propose an agrarian bill which would have placed large powers in the hands of a commission at a time when Pompey on his return would need land for his veterans. This too was defeated, thanks to the oratory of Cicero.

Cicero had beaten Catiline at the consular elections for 63 with Optimate support; as a *novus homo* of equestrian stock and a supporter of Pompey, Cicero was not an ideal candidate from the Optimate point of view, but he was at least preferable to Catiline. When Catiline failed once again at the elections of 63 to gain position by constitutional methods, he turned to revolutionary means, and planned a general uprising in Italy and a revolution in Rome. After the Senate had passed the *senatus consultum ultimum,* the plot was unmasked by Cicero, who arrested the leading conspirators in Rome and had them executed out of hand, thus preventing a *coup d'état;* Catiline, who had joined an army which he was raising in Etruria, was killed in the field in January 62. Catiline's threat of violence had united senatorial, equestrian, and Italian opinion on Cicero's side, and he began to hope to make this agreement (*concordia ordinum*) permanent. But without sufficient family connections and not being an army commander, he lacked an adequate *clientela* to build up a political party, and he depended too much on the goodwill of the Optimates. Further, hopes of a *concordia* were weakened by the scandal of the Clodius affair (*see* CLODIUS, PUBLIUS).

When Pompey returned to Italy at the end of 62 he disbanded his troops amid general relief, but Cicero, who had hoped that Pompey would play a leading part in his plans for *concordia,* did not find him very helpful. Pompey naturally expected widespread recognition of his achievements and was nonplussed when the Senate, led by Cato (*q.v.*), refused to ratify his eastern settlement at once and did not provide land for his veterans. Meantime,

ALINARI

(LEFT) POMPEY, IN THE PALAZZO SPADA, ROME; (RIGHT) JULIUS CAESAR, IN THE CAPITOLINE MUSEUM, ROME

Caesar, who had become *pontifex maximus* (63) and praetor (62), had campaigned in western Spain. He now wanted a triumph and to stand for the consulship of 59, but he was blocked by the Senate, which also alienated Crassus by refusing to adjust a contract for the taxes of Asia.

Repulsed by the more conservative senators, these three men made a private compact (*amicitia*), the so-called first triumvirate, to promote their mutual interests. Thus, with the help of Crassus' money, Pompey's potential military strength, and Caesar's prestige, the three men got their way. Cicero recognized this agreement, which was strengthened by Pompey's marriage to Caesar's daughter Julia, as a turning point and the ultimate origin of the civil war of 49. He felt that he had lost freedom of speech and *auctoritas* and that henceforth the state was at the mercy of dynasts (*principes*), who strove for personal *potentia* and *dignitas*. When Caesar became consul (59) he secured the ratification of Pompey's eastern settlement and, with the help of Pompey's veterans, carried a land bill for them, together with a rebate for Crassus. He himself was given a provincial command by a *Lex Vatinia:* Cisalpine Gaul and Illyricum, to which Transalpine Gaul was added, for five years. In 58 he started that series of campaigns which added all Gaul to the empire (*see* CAESAR, GAIUS JULIUS).

During his absence his interests in Rome were upheld in 58 by the tribune P. Clodius, who gained popularity by a measure to distribute free grain (for the first time; this was a very different measure from the cheap grain sold by Gaius Gracchus; Clodius, rather than Gracchus, should be charged with the demoralization of the urban plebs). Clodius also secured the outlawing of Cicero for his execution of the Catilinarian conspirators without a trial, and sent Cato off on a mission to Cyprus. He then attacked Pompey, who was forced to turn for protection to Milo. Milo organized a rival gang to oppose the rowdies who supported Clodius, and gradually order broke down in the city; mob rule threatened. Pompey secured Cicero's return in 57.

The triumvirate seemed to be breaking up, but the three men met at Luca in 56 and agreed to continue their cooperation. Pompey and Crassus became consuls for 55, and Caesar's Gallic command was prolonged for another five years. Pompey, after his consulship, was to govern Spain (which he did through deputies, *legati,* while remaining in Italy himself). Crassus obtained Syria, where he launched a campaign against the Parthians which ended with defeat and his death at Carrhae (*q.v.*) in 53. Thus a link between Caesar and Pompey was broken; another had snapped when Julia died in 54. Disorders in Rome culminated in the murder of Clodius by Milo (52), when Pompey became sole consul to secure order.

In a rapidly deteriorating situation Pompey and Caesar drifted further apart. Caesar feared that if he came to Rome as a private citizen he would be attacked by his enemies. He therefore sought a prolongation of his Gallic command until he could step straight into a second consulship (in 49 or 48). The Optimates opposed this and Pompey did nothing to help Caesar, who relied for help in Rome on Curio (tribune in 50). The extremists in the Senate, who tried to use Pompey to crush Caesar, refused to accept a vote of the Senate that both men should give up their commands and disarm. When finally they asked Pompey to save the republic, he decided to accept the call. The Senate expelled Marcus Antonius and another tribune and passed the *senatus consultum ultimum.*

When the tribunes fled to Caesar in north Italy, he crossed the Rubicon, thereby invading Italy and precipitating a civil war that was fought in the last resort for personal power and honour rather than in defense of a free republic: few could believe that this still survived or that the Optimates could justly claim to represent it.

6. Caesar's Dictatorship and the Second Triumvirate.—Now that the die was cast, Caesar compensated for his relative weakness (his main troops were still in Gaul) by speed of movement. This, combined with the obstinate lack of cooperation by L. Domitius Ahenobarbus (who had been appointed to succeed Caesar in Gaul), forced Pompey to evacuate Italy within two months and to withdraw to Greece. Since Pompey had forces in Spain (his province), Caesar struck at these first, defeating the main army at Ilerda (*q.v.*), securing the whole peninsula, and capturing Massilia on his return to Italy. His cause was less successful in Africa, where he sent Curio to eject its Pompeian governor; Curio was defeated and Africa remained Pompeian for over two years. Back in Rome Caesar was made dictator, but as soon as he was elected to his second consulship for 48 he resigned the dictatorship after 11 days. He then crossed to Greece, where after a setback at Dyrrachium he finally defeated Pompey at Pharsalus (*q.v.*) in 48. Pompey fled to Egypt, where he was murdered on landing. Caesar followed and spent the winter in Alexandria with Cleopatra (*q.v.*), who after the death of her brother Ptolemy XIII became queen of Egypt. After a swift campaign against Pharnaces, the son of Mithradates, which ended in victory at Zela (47), Caesar returned to Italy and Rome, where there had been disturbances and no consuls had been elected for 47.

During his absence Caesar had been made dictator again, probably for a year from October 48, and his master of the horse, Mark Antony (Marcus Antonius; *see* ANTONIUS), was trying to maintain order. Caesar, who was elected to his third consulship for 46, carried some economic measures, pardoned many Pompeians who submitted, and then left for Africa, where in 46 he defeated the Pompeians at Thapsus (*q.v.*). The subsequent suicide of Cato symbolized the death of republican hopes. Before Caesar returned to Rome to celebrate a fourfold triumph, he had already been appointed dictator for ten years and *praefectus moribus* with censorial powers; later he was elected consul for 45. Meanwhile two of Pompey's sons had been organizing resistance in Spain, and Caesar was forced to go there before the end of 46. After defeating them at Munda (45), he returned to Rome where he remained until his death. He was elected to his fifth consulship for 44, with Antony as colleague, and finally, about mid-February of 44, he was made dictator for life; a month later came the Ides of March.

Caesar's Achievements.—During his brief periods in Rome Caesar had carried out an immense amount of legislation: measures to relieve debt, to reform the calendar, to suppress all political clubs, to improve the city (*e.g.,* a new Forum) and help Italy (*e.g.,* draining the Pomptine Marshes), to enfranchise Transpadane Gaul, to settle his veterans and poor citizens in new colonies (especially overseas, in Gaul, Spain, and Africa and, for commercial purposes, at Carthage and Corinth), to improve the taxation of the provinces, to grant Roman citizenship widely to provincials, and to give Latin status to communities where the native element predominated. He planned to safeguard the frontiers of the empire by campaigns against the Dacians and, to avenge Crassus, against the Parthians; he was about to start on the latter when he was murdered.

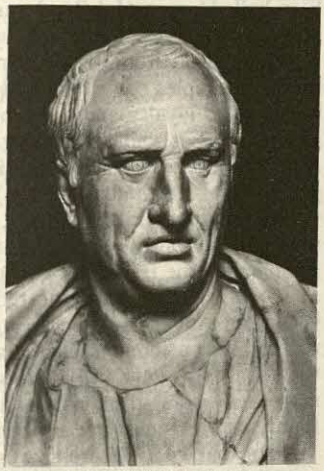
At home his power rested constitutionally upon the dictatorship; his other offices were secondary. Although he increased the number of praetors and quaestors, he overshadowed the magistrates and controlled the administration either personally or by means of his master of the horse, *praefecti,* and even private agents. He increased the Senate to 900 members, rewarding those who had helped him to victory; many of the new senators were knights, men of substance, especially from Italian towns; the number of centurions, freedmen, and provincials (who included a few notables from Gaul) was small. If the Senate retained its prestige, it lost its powers of initiative, since its majority owed all to Caesar.

There is no doubt that his conduct became more autocratic in the last months of his life when more and more honours were heaped upon him, and that therefore he became increasingly obnoxious to many of the older nobility. He traced his own ancestry to Venus Genetrix and on public occasions wore a laurel wreath and triumphal robe, but though Antony became his priest (*flamen*) the evidence that he sought worship rather than honour is highly suspect. Some have thought that he wished to become a Roman *rex,* reviving the monarchy of five centuries earlier, despite the Roman hatred of the word *rex.* Others, with even less probability, have believed that he wanted to become a Hellenistic king (*basileus*) with all the trappings of oriental ruler cult. Others again have

argued that he had not decided to destroy the form of the republic and that he would not have reached any final decision until he had returned from his Parthian expedition.

His intentions may well not have been fully formulated, and they are certainly veiled from us, but he must have realized that some form of autocratic control was necessary. Since some of his contemporaries also realized and resented this, Gaius Cassius, M. Brutus, and at least 60 others formed a conspiracy to remove the "tyrant," although the Senate had taken an oath to protect his person. They struck on the Ides (15th) of March, and Caesar fell at the foot of Pompey's statue.

Civil War.—The result of Caesar's assassination was 13 years of civil war. The surviving heads of state were the consul Antony and the master of the horse, M. Aemilius Lepidus. By decisive action while the Senate hesitated, they gained control of the situation; and on Cicero's proposal the assassins were granted an amnesty and the office of dictator was abolished. But Antony's position was soon challenged by Gaius Octavius, Caesar's adopted son and heir (conventionally known from 44 to 27 as Octavian), who came from Greece to claim his position, trusting to gain the support of Caesar's veterans. During the winter of 44/43 Cicero tried to revive the old republican constitution and boldly denounced Antony's ambitions in a series of speeches, the *Philippics*. In 43 he was so far successful that war was declared on Antony, who was defeated by the republicans and Octavian. But Octavian himself then marched on Rome and demanded the consulship.



ANDERSON—ART REFERENCE BUREAU

CICERO, PORTRAIT BUST IN MARBLE. IN THE CAPITOLINE MUSEUM, ROME

Thereafter he met Antony and Lepidus, and the three formed the "second triumvirate," this time a formal commission, confirmed by a *Lex Titia*. They then proceeded to eliminate the republicans by a ghastly proscription in Rome (the victims included Cicero) and by force of arms in Greece; Brutus and Cassius, who had been mustering forces in the east, were defeated at Philippi (*q.v.*) in 42. Antony's next task was to see to the east and deal with the Parthians, while Octavian remained in the west to check Sextus Pompeius (*q.v.*) and to get land for their veterans; Lepidus was virtually ignored.

Octavian first had to eliminate opposition from Antony's brother Lucius and wife Fulvia, who were compelled to capitulate at Perusia (41), leaving Octavian master of Italy. A breach with Antony was avoided by the Treaty of Brundisium (40), and the reconciliation was strengthened by Antony's marriage (Fulvia had died) to Octavia, sister of Octavian. After temporarily recognizing Sextus Pompeius, who had gained control of Corsica, Sardinia, and Sicily (Treaty of Misenum, 39), Octavian turned against him. After a meeting with Antony at Tarentum (37), where the triumvirate was renewed for five more years, Octavian with the help of his friend Agrippa defeated Sextus in a naval campaign and then overthrew Lepidus, whose occupation of Sicily he refused to recognize. Thus Octavian had restored order by land and sea and was master of the west (36).

In the east, where the Parthians had invaded Syria, Antony was slow to act, but his generals were successful: Ventidius defeated the Parthians (39–38), and Sosius installed Herod the Great in Jerusalem. But Antony had met Cleopatra at Tarsus in 41 and had spent the winter of 41/40 with her at Alexandria; in 37 he sent his wife, Octavia, back to Italy and may have married Cleopatra according to Egyptian, but not Roman, form. At last in 36 he invaded Parthia, but with disastrous results, though in 34 he temporarily annexed Armenia. Back in Alexandria he proclaimed the Donations of Alexandria by which Cleopatra and her children received grants of lands and titles in the east. The children were Caesarion, whom Antony recognized as the legitimate son of Caesar (thereby making Octavian a usurper), and Alexander Helios, Ptolemy Philadelphus, and Cleopatra Selene, whose father was Antony himself.

Meantime Octavian was protecting Italy's northeastern frontier by campaigns in Illyricum (35–33). The break with Antony could not be long delayed, especially when he formally divorced Octavia in 32. A general swearing of allegiance (*coniuratio*) to Octavian took place in Italy and the west; the Senate annulled Antony's triumviral powers and declared war on Cleopatra. As consul in 31 Octavian mustered large land and naval forces in Greece. The final clash came by sea at Actium (September 31). Cleopatra fled to Egypt, followed by Antony; after they had committed suicide (30), Octavian annexed Egypt and settled the east. He was now undisputed master of a war-weary world.

Despite civil wars, misgovernment, corruption, the ambitions of rival dynasts (*principes*), and the collapse of the republican constitution, the Roman world still offered a foundation on which a new system could be built. Further, the political unification of Italy was reflected in the greater unity of Italian civilization. The whole of this period, and especially the Ciceronian age, showed a steady advance in oratory, art, and letters, and a greater synthesis of Greek and Roman traditions. If Cicero was the dominant literary figure, there were also Lucretius and Catullus, Caesar, Varro, and Sallust. Political instability had not undermined all creative production, nor had the civil wars destroyed the economic prosperity of Italy, supported as it was by the resources of the provinces.

II. THE EMPIRE

A. The Principate, 27 B.C.–A.D. 284

1. The Establishment of the Principate.—Octavian, the heir of Caesar, had led a faction to victory in a civil war. With the elimination of all his rivals, he could now identify his faction with the state. "By the common consent of all men I received the absolute control of affairs": in these words he proclaimed his universal sovereignty and the moral basis on which he alleged it rested. His triumviral powers may legally have terminated at the end of 33, but he held the consulship every year from 31 onward, and as long as he enjoyed the loyal support of the armies his position was unchallengeable.

But with peace reestablished, how was he to act? If he followed the example of Sulla and retired into private life, the renewal of civil war was almost certain. If, however, he openly tried to retain autocratic power, he would so offend the nobility and the traditions of 500 years that he would court the same fate as Julius Caesar. In order to safeguard internal peace and to ward off external attack by the barbarian tribes beyond the empire, he alone must retain a unified military command, otherwise history might be repeated and the central government be challenged by provincial commanders. But such authority, if retained, must be masked in republican forms if it was to endure. Octavian thus had to seek a compromise. This he reached by a careful process of testing and responding to public opinion, of trial and error, and so he ultimately found a secure basis on which to establish a principate which lasted for about 200 years.

His first task was to restore confidence and to ease the transition from war to peace. While he was still in the east he was granted various honours; if these included, and he accepted, an offer of tribunician power, he made little use of it before 23. More noticeable was his continued use of *Imperator* as a *praenomen* in place of Gaius, which he had adopted in 38; it connoted an exceptional claim to authority (*see* Emperor) but lacked any constitutional significance. At the beginning of 29 the Senate confirmed all his official actions (*acta*); by August he had returned to Rome, where he celebrated his triumph and marked the formal end of the civil wars by closing the Temple of Janus. He reduced his 60 legions ultimately to 28 and settled the veterans in colonies in Italy and the provinces. In 28 he held his sixth consulship, with his friend and helper Agrippa, and both consuls remained in Rome throughout the year for the first time for 20 years. By virtue of a grant of *censoria potestas* Octavian reduced the number of senators

from 1,000 to 800 (later to 600) and held a census. By edict he retrospectively annulled any illegal actions taken during the civil wars.

Stability was returning and he was ready for a more general settlement, hastened on perhaps by the implications of the military achievements of M. Licinius Crassus, the proconsul of Macedonia, and by the ambitions of Gaius Cornelius Gallus, his prefect of Egypt. Thus in January 27 B.C., at a meeting of the Senate, he formally renounced all his powers and provinces and put them at the free disposal of the Senate and Roman people, but he at once agreed to administer a large *provincia,* comprising Spain, Gaul, and Syria, for ten years. Whether he received a special grant of proconsular *imperium* for this purpose, or acted through the consulship which he held each year until 23, is uncertain; the view that his *imperium* was (at this stage) greater (*maius*) than that of governors in the senatorial provinces is improbable. Despite the title *Augustus* and many other honours which he received, despite widespread oaths of personal allegiance to him, he might claim that the "restoration of the republic" was secured by the fact that his powers derived from the Senate and Roman people and were limited in time. Others might regard the settlement as a recognition by law of a personal supremacy.

In 23 important changes were made in the formal basis of the authority of Augustus. He abandoned the consulship; his long tenure of it had been unpopular with the nobles and perhaps burdensome to himself, especially in view of critical illnesses in 25 and 23. By way of compensation the Senate increased his *imperium* in two respects: it was not to lapse when he entered Rome, and it was made *maius imperium proconsulare*—that is, greater than that of any other proconsular governor, so that, if he required, Augustus could intervene in any senatorial province. This gave him ultimate control of the armies and provinces, but now that he had ceased to be the chief magistrate in Rome he needed further authority in civilian affairs. This he found in tribunician power (*tribunicia potestas*). He had been offered this previously (indeed he received tribunician sacrosanctity as early as 36), but if he had accepted the offer, he certainly made little use of this power until 23. The tribunate had a long popular history in the city, and so Augustus kept his military powers as veiled as possible and advertised his tribunician power. From 23 B.C. he numbered the years of his principate from this power, which Tacitus later described as "a term to express his supreme position." It gave him such rights as presenting legislation to the people and exercising a veto (*intercessio*). He received also the right to bring forward the first motion at any meeting of the Senate, a body which he could himself summon and consult. These powers, although originating from the Senate, were perhaps sanctioned by the people in a *lex de imperio,* such as that later passed on behalf of the emperor Vespasian, which has survived.

Proconsular *imperium* and tribunician power were the two foundations on which the authority of Augustus and his successors rested. He refused some further powers, such as the offer of a dictatorship and consulship for life in 22, but in 19 he accepted an official seat between the consuls, together with an escort of 12 lictors, and possibly some other specific rights enjoyed by a consul. When Lepidus died in 12 B.C. Augustus became *pontifex maximus,* and in 2 B.C. he was acclaimed as the "father of his country" (*pater patriae*); throughout his lifetime his pronconsular *imperium* was regularly renewed for five or ten years at a time.

Such was the ingenious compromise by which room was found for the master of the legions within the narrow limits of the old Roman constitution. Augustus could say with truth that he had accepted no office which was "contrary to the usage of our ancestors," and that it was only in *auctoritas* (prestige) that he took precedence of his colleagues. Yet the compromise was unreal, and its significance was ambiguous. It was an arrangement avowedly exceptional and temporary, yet few could suppose that in effect it would be other than permanent. The powers voted to Augustus were voted only to him; they were thus made coextensive in time with his life, and there was no provision for hereditary or any other form of succession. Thus Augustus had to devise various expedients to bridge the gap which would be caused by his death.

He had in fact developed a political position which was capable of transference, and dynastic succession was an obvious solution. But Augustus had no son, only a daughter, Julia, whom he married successively to his nephew Marcellus, his friend Agrippa, and his stepson Tiberius. But his two grandsons, born to Julia and Agrippa, died, so that he ultimately was forced to adopt Tiberius, who was granted tribunician power in A.D. 4 and proconsular *imperium* in 13. Thus when Augustus died in 14 Tiberius was virtually a co-regent, and was marked out as the man upon whom the remaining powers of the principate would naturally be bestowed. Not the least of Augustus' achievements was this somewhat makeshift arrangement for the transference of power in a way that averted the renewal of civil war. But in contrast to the maxim that "the king never dies," it has been well said that in law, though not in practice, the Roman principate died with the death of the *princeps*.

Thus Augustus did not seek to become a Roman king, a *rex,* and still less a Hellenistic monarch, a *basileus*. His private life was comparatively simple and his household moderate. But in Egypt he was the successor of the god-king pharaoh and in Syria of the Seleucid monarchs who had developed a ruler cult of the living king. Further, it was nearly 200 years since a Roman had first been hailed by grateful Greeks as divine, and many Romans thereafter had received divine honours in the east. Augustus tried to canalize this attitude by allowing Greek cities in Asia Minor to dedicate temples to "Rome and Augustus." Such cults were expressions of loyalty and were maintained by federations (*koina*), groups of cities which sent delegates to a joint assembly; a similar *concilium* was even introduced into the west for the three Gallic provinces at Lugdunum (Lyons).

In Rome and Italy, however, where Augustus fostered the revival of old Roman religious cults and practices and where he had championed the traditions of the west against the religious beliefs of the east which were reflected in the challenge of Antony and Cleopatra, Augustus deprecated any worship of himself. Since 42 B.C. and the posthumous consecration of Julius Caesar, he had been the "son of a god" (*Divi filius*), but he would countenance no more than worship of his Genius, the spirit which promoted his family and fortunes; and he linked this with the Lares Compitales (spirits that guarded crossroads). For this cult he allowed the establishment of *seviri Augustales,* freedmen in the cities of Italy. But all this, though technically not far from deification, was conceived as an expression of loyalty to Augustus and the new order, and Augustus frowned upon any suggestion of real worship of himself in Rome or Italy. Only after his death did Augustus become *Divus,* an honour which came to be reserved for those emperors whose principates had won general approval.

2. Administration by Princeps and Senate.—Although the Augustan system is not now generally regarded, with Mommsen, as a "dyarchy," a joint rule of *princeps* and Senate, Augustus clearly shared the administration with the Senate while at the same time retaining the undivided control of the army which was the ultimate sanction of his power. The *princeps* could legislate in various ways (*e.g.,* by edict), while the resolutions of the Senate (*senatus consulta*) gradually gained the force of law. In jurisdiction both *princeps* and Senate received the authority to act as high courts in cases of sufficient gravity, with no right of appeal from the verdict of one court to the other. Further, since Augustus was granted the right to reverse capital sentences passed by magistrates, "appeal (*appellatio*) to Caesar" gradually replaced the republican process of "appeal (*provocatio*) to the people."

In financial matters the republican *aerarium* remained the chief treasury; when it was in difficulties Augustus made large grants to it from his private funds (*patrimonium*). Although an imperial treasury or *fiscus* (apart from his patrimony) was probably not centralized in Rome until the reign of Claudius (if then), Augustus exercised a general financial oversight, as seen in his regular publication of a balance sheet of the empire (*rationes imperii*).

The general administration of Rome and Italy remained the primary concern of the Senate and the ordinary magistrates, who were also responsible for all those provinces which the emperor himself did not administer; these senatorial or "public" provinces

were in the main those where it was not necessary to station legionary forces. In yet another way the influence of the Senate was soon increased: Augustus' successor, Tiberius, transferred the election of magistrates to it from the *comitia.* Augustus himself did not go so far, but a *Lex Valeria Cornelia* in A.D. 5 probably established a panel of senators and *equites* who by a complicated voting system (*destinatio*) recommended candidates for the consulship and praetorship; the *comitia centuriata* thereafter probably merely ratified the choice. Augustus himself seems to have made only sparing use of the powers of nominating and commending candidates which were exercised by later emperors. Thus in all spheres, except the military, the Senate retained some of its traditional activities and even gained some new duties. Its cooperation in running the empire was essential to the success of Augustus' hopes for peace and stability.

In order to make the Senate more efficient, Augustus designed a standing senatorial committee to prepare business for the main body; this council, however, was not maintained either by himself or his successors in its original form. But efficiency depended no less on personnel than on machinery, and Augustus determined to make the senators more worthy and responsible. This he did by controlling entry into the Senate, which was normally recruited from members of the senatorial order, men of senatorial birth. In addition to birth, he made a period of military service, a property qualification, and above all personal integrity indispensable prerequisites for entry. He could also grant to young *equites,* suitably qualified, the possibility of membership of the Senate. Further, senators alone would not suffice in the vast task of administering the empire, so he turned to the equestrian order and made membership of it dependent on personal character as well as on a property qualification and military service. By using members of this order in the public service, he secured their loyalty to the state and helped to heal the breach that had long divided them from the Senate.

Augustus' insistence on the moral qualities of public servants reflects his general concern to raise standards of conduct. Wealth, derived from foreign conquests and provincial exploitation, combined with the demoralizing influences of years of civil war, had corrupted Roman society, particularly those classes which would provide the leaders. And so Augustus tried not only to infuse some fresh blood from Italy into the older Roman oligarchy, but also to reform the heart of Roman society itself by a body of legislation designed to promote respect for marriage and the family by punishing adultery and encouraging the birth rate. He also tried to stem the increasing intermixing of foreign elements with the Italian citizen body by laws which put a check upon manumission. In an attempt to revive pride in older Roman ways and in the city as the heart of the empire, Augustus not only restored old temples and buildings and beautified the capital city but also improved its public services: the water and food supplies were secured, the danger of fire was reduced by the creation of seven cohorts of *vigiles* (the watch), and public order became the responsibility of three urban cohorts under the command of the prefect of the city. Further, Augustus revived many traditional cults and ceremonies. Under his patronage Virgil, Horace, and Livy recalled the earlier virtues of Rome and the Italian countryside, its destiny and imperial responsibilities, while the peace and prosperity of the new era were splendidly depicted on the Ara Pacis Augustae in the Campus Martius. The Greco-Roman culture of the Mediterranean world was now becoming one, and Augustus fixed the centre of gravity of the empire in Italy and the west.

3. The Civil Service and Army.—*Civil Administration.*—The authority of Augustus and the stability of the new regime would have been speedily undermined if he had failed to enjoy the support of the civilian administrators and the officer class. The former were drawn from the reorganized senatorial and equestrian orders, and for them Augustus provided an attractive career in which efficiency was rewarded with promotion in accordance with a well-established pattern. Members of the senatorial order who were properly qualified and had held a minor magistracy (the vigintivirate), if elected quaestors, entered the Senate, and then the more able could ascend the higher rungs of a senatorial career. After holding either the aedileship or the tribunate of the plebs, they could stand for one of the (normally) 12 praetorships if they had reached the age of 30. Since the regular age for holding the consulship was 42, an interval followed during which many "praetorian" posts were open. A man might become the commander (*legatus*) of a legion, serve as *legatus* on the staff of a provincial governor, become the governor of a lesser imperial province (*legatus Augusti pro praetore*), or proconsul of a senatorial province (such governors received this title, whether or not they had yet held the consulship itself).

Those who then gained the consulship could look forward to the governorship of a more important imperial province, a curatorship in Rome (*e.g., operum publicorum,* responsible for public buildings), the prefecture of the city, or the governorship of one of the important senatorial provinces of Africa or Asia. A good career in administrative posts was also opened up for suitably qualified members of the equestrian order, after their preliminary military service. Augustus used them as financial agents (*procuratores*) in his provinces (their traditional business interests made them well suited in this sphere), and also as governors (*procuratores,* though at first some may have been called *praefecti*) of the less important imperial provinces (*e.g.,* Judaea). Thereafter the most successful might look forward to one of the great prefectures: of the fleet (*classis*), the watch (*vigiles*), the grain supply (*annona*), Egypt, or the praetorian guard.

Thus Augustus laid the foundations of a civil service. These men were not amateurs, like the magistrates of the republic, but became professionals who served for long periods and received a salary. The greater number were the servants of the emperor, appointed by and responsible to him, and not many of those who were appointed by the Senate to serve in senatorial provinces and posts would be likely to secure appointment without his approval. Thus an efficient system was developed which avoided many of the weaknesses that had marred the administration of the late republic; misgovernment and corruption were reduced, although not totally banished. This achievement of Augustus, though unspectacular, was among his great gifts to the Roman world. By supplementing with new machinery what he could salvage from the republican system, he avoided too sharp a break with the past and created a means to hold the empire together and to promote its prosperity.

Military Organization.—Good civil administration, however, was little use if the security of the empire was threatened by attack from beyond its frontiers. A professional army was needed for defense, but its loyalty to the central government must be ensured at the same time. Since the challenge of provincial governors, backed by their armies, had been one of the main causes of the collapse of the republic, Augustus had to create a standing army whose loyalty he could count upon and which was large enough to guard the frontiers. None knew better than he the dangers inherent in the older army system when he set his hand to creating from the armies of the triumviral period a professional force which would remain loyal to state and *princeps.* First, he established a privileged corps, the praetorian guard of nine cohorts stationed in various parts of Italy. At the end of the civil war more than 60 legions were under arms; of these he discharged over half (providing land for them) and retained 28 legions. These became permanent units, each with its number and title, with adequate pay, good prospects of promotion (there were 60 centurions in each legion), and a pension in the form of money or land after 20 years' service. This pension was provided ultimately by the state and not by the emperor, who created a special fund (*aerarium militare*) for this purpose and maintained it from the revenue from a sales tax and death duties. The legionaries were recruited from Roman citizens, and therefore primarily from Italy and the western provinces.

The second main branch of the army comprised the *auxilia,* which were kept separate from the legions although coming under the command of the legionary legates. They were raised from non-citizens in the less romanized (that is, the imperial) provinces, and as a reward for 25 years' service they received citizenship on discharge. Thus Augustus made much more use of the manpower of the provinces for defense than had been the practice

during the republic. In all, the *auxilia* probably numbered around 150,000 men, and the total of the legions was about the same, so a regular army of about 300,000 men was established, and its units were stationed in the provinces where they were most needed.

In relation to the length of frontiers to be guarded, this force was only just adequate, and wars often involved moving troops from one front to another. Under the immediate successors of Augustus the normal distribution was three legions in Spain, eight on the Rhine, seven on the Danube, four in Syria, two in Egypt, and one in Africa. In peacetime also they played a useful role, building roads, bridges, aqueducts, and canals, and spreading Roman ways of life to the more distant parts of the empire. (*See* also ARMY: *Ancient Armies: Rome.*)

Augustus also maintained a small regular naval force with bases at Misenum, Ravenna, Forum Julii (Fréjus), Alexandria, and probably Seleucia in Syria. These ships kept down piracy and enabled troops and supplies to be moved throughout the Mediterranean with speed and safety.

As long as Augustus could count on the loyalty of the commanders, this military reorganization would guarantee the maintenance of the *pax Romana* within the empire and guard it from external attack, provided that adequate frontiers could be established.

4. Frontiers and Provinces.—*Eastern Frontier.*—Now that one man controlled the military forces of the state and very largely determined its foreign policy, it became possible to regard the problems of the empire as a whole and to design plans to secure really effective frontiers. One danger spot was in the east, where the Parthians still held the Roman standards captured from Crassus and Antony. Augustus showed appreciation of this threat by his own presence in the east (in 30–29 and again in 22–19) and by the commands in the east granted to his friend and helper Agrippa in 23–21 and in 17–13. To the three Roman provinces in Asia Minor (Asia, Bithynia, and Cilicia) Augustus added Galatia when its king was killed in 25 B.C. The key state in the east, however, was the native kingdom of Armenia, which might prove to be a bone of contention between Rome and Parthia. Augustus decided, if possible, to avoid war, and by a show of force persuaded the Parthians to return the Roman standards in 20 B.C. and to acquiesce in a Roman nominee on the throne of Armenia. This diplomatic triumph Augustus regarded as one of the great achievements of his principate; it was confirmed by further negotiations in A.D. 1, and so the two great empires could continue to live at peace, with the Euphrates limiting their spheres of interest. Roman military defense of the east was based on the forces in Syria.

To its south lay the client kingdom of Herod the Great in Judaea, but after his death (4 B.C.) and ten years of oppressive rule by his son Archelaus, Judaea was made into a small imperial province. A Roman expedition into Arabia in 25–24, designed to promote trade and further commerce with India, met with ill success and was not followed up.

Northern Frontier.—The relative security in the east gained by agreement with Parthia allowed Augustus to undertake thoroughgoing measures to safeguard the other frontier where danger lay, the northern. Since the mass of barbarian tribes beyond the Rhine and Danube might threaten the security of Italy and the Balkans, Augustus planned by widespread conquest to advance Roman control as far as the Danube. This was achieved in a series of campaigns, in which his stepson Tiberius played a leading part: Raetia and Noricum (16–15 B.C.) and, farther east, Pannonia (13–8) and Moesia were added to the Roman Empire. When in 12 B.C. Augustus ordered an advance over the Rhine as far as the Elbe, he was apparently contemplating the permanent occupation of western Germany and a frontier along the Elbe and Danube to replace that of the Rhine and Danube which had just been gained. In order to complete this scheme it was necessary to reduce the Marcomanni in Bohemia, but before a converging attack of no fewer than 12 legions could be completed, news came of a great revolt in Pannonia and Illyricum (A.D. 6–9). No sooner was this crushed than Arminius, the chief of the Cherusci in Germany, annihilated three Roman legions under Varus in the Teutoburg Forest in western Germany. Although the immediate situation was retrieved, Augustus, now old and disheartened, abandoned his policy of conquest east of the Rhine and reverted to this river as the permanent frontier, on which no fewer than eight legions were stationed in six camps between Holland and Switzerland. The line of the Danube was guarded by seven legions.

Africa, Spain, and Gaul.—Elsewhere in the empire there was reorganization, but this involved relatively little fighting. Egypt, where Augustus was the successor of the Ptolemies, was administered for him by a prefect of equestrian rank, and the complicated bureaucratic and monopolistic administration of the Ptolemies was adapted to the new needs; Alexandria remained a centre of commerce and culture, and the peasants of Egypt toiled to produce grain and wealth for their new master. The southern frontier was secure after a punitive raid into Ethiopia (Nubia). Another granary of Rome was the old province of Africa which now, with Numidia, became Africa Proconsularis, a senatorial province with a former consul as its proconsular governor. With Carthage restored as a Roman colony, Roman civilization continued to spread through an area already permeated with Berber and Punic influences; minor campaigns on its desert frontiers thrust raiding tribesmen back.

In Spain the Astures and Cantabri in the northwest had never really submitted to Roman authority. Augustus himself in 26 B.C. led a campaign which was ended by the more ruthless methods of Agrippa in 19. Settlement followed the conquest: hill tribes were moved down to more open valleys, new towns were developed in the northwest, and veterans were settled at Emerita (Mérida) and Caesaraugusta (Saragossa). Spain was divided into three provinces: the more civilized Baetica was handed over to senatorial administration, while Augustus became responsible for Lusitania and Tarraconensis (Hither Spain, or Hispania Citerior).

Gaul too was reorganized. Narbonensis (Gallia Narbonensis), which had been a province for nearly a century, was entrusted to the Senate, while the rest of Gaul was divided into three districts, the *Tres Galliae:* Aquitania, Lugdunensis, and Belgica. Like Spain, it flourished; tribal organization began to merge into municipal, road construction promoted commerce, and a provincial *concilium* at Lugdunum (as one at Tarraco in Spain) loyally fostered the worship of *Roma et Augustus.* Trade across the English Channel increased, but despite rumours that he would invade Britain, Augustus decided to leave the island outside the Roman Empire.

Provincial Administration.—The provinces, exhausted by long periods of civil war and maladministration during the late republic, now enjoyed peace and more equitable government from the professional salaried officials of the reformed senatorial and equestrian orders. (*See* also PROVINCE, ROMAN: *The Principate.*) In order to spread the financial burdens more fairly, Augustus surveyed the resources of the empire by means of periodical censuses which revealed the extent and ownership of land and other wealth. These returns provided the basis for fair taxation. Direct taxes were levied on all occupiers of land (*tributum soli*) and on other forms of property (*tributum capitis;* this was a poll tax in backward areas, like Egypt). Italy and a few towns that enjoyed the *Jus Italicum* were alone exempted from the land tax which all provincials, including Roman citizens, had to pay; some privileged towns were exempt from the *tributum capitis.* Indirect taxes were levied on manumission, on the sale of slaves, and on inheritances, together with some customs and harbour dues. These taxes were still collected by *publicani,* but the latter were now strictly controlled. The direct taxes in the imperial provinces were collected by an imperial procurator of equestrian rank who was largely independent of the governor, while in the senatorial provinces the quaestor was responsible for finance, although *publicani* continued to act as middlemen in some of them. In general the revenue from the taxes was only just adequate to meet the normal expenditure on the army and its pensions, on the civil service, and on public works; when it proved insufficient Augustus used some of his great personal wealth to help, a precedent which not all his successors wished or were able to follow.

Development of Urban Life.—Augustus followed the republican tradition of working through the existing provincial communities,

whether cities or tribes. Without an adequate basis of local self-government the administrative system imposed by Rome on the provinces would have collapsed. The officials had to rely on the cooperation of the provincials. Where no cities with organized magistrates and councils existed, Rome made use of the tribal system (as in Gaul, and later in Britain), but the tribes (*civitates*) often quickly borrowed the titles used in Roman cities and had their own *duoviri* and senate (the *ordo*). Rome encouraged, without enforcing, city life, and towns served as centres to large areas which were attached ("attributed") to them for administrative purposes; municipal privileges would be extended to this territory when it became more civilized. The settlement of colonies of veterans in the provinces helped to spread urbanization; at least 40 were established by Augustus, the majority in the peaceful areas in the west.

The status of the provincial cities varied considerably. The most privileged were the colonies, settlements of Roman citizens, and next to them the *municipia*, existing cities which were granted Roman citizenship. Next came the "Latin" cities, whose status was between that of citizen and non-citizen towns; their local magistrates became Roman citizens. These Latin rights (*see* LATIN RIGHTS) were generally granted to cities before they were raised to the status of *municipia*. Lastly were the "stipendiary" cities, which formed the majority in most provinces.

The internal constitutions of all these various cities naturally varied, but even those without Roman citizenship tended to copy the institutions of republican Rome, with popular assemblies, senates, and magistrates, while the older Greek cities in the eastern part of the empire had enjoyed well-developed constitutions for centuries. In general the propertied classes controlled the local senates, and it was they who provided the magistrates, who in accord with Roman tradition were collegial, annual, and unpaid. Many of these men were extremely generous to their towns, providing baths, theatres, and other amenities. Thus local patriotism fostered a healthy municipal life, which was secured by the degree of civic liberty that the Romans wisely accorded to the provinces and by the increasing spread of Roman citizenship.

TABLE I.—*Roman Emperors, 27 B.C.-A.D. 180**

Reign dates	Name	Reign dates	Name
27 B.C.–A.D. 14	Augustus	81–96	Domitian
14–37	Tiberius	96–98	Nerva
37–41	Gaius (Caligula)	98–117	Trajan
41–54	Claudius I	117–138	Hadrian
54–68	Nero	138–161	Antoninus Pius
68–69	Galba	161–169	Marcus Aurelius and Lucius Verus
69	Otho		
69	Vitellius	169–177	Marcus Aurelius
69–79	Vespasian	*175*	*Avidius Cassius (East)*
79–81	Titus	177–180	Marcus Aurelius and Commodus

*Usurpers in italics.

Economy.—Economic life continued in much the same way as during the republic: Augustus initiated no fresh economic policy, no state controls or monopolies. Private competition was allowed to continue freely between all who engaged in industry or trade. The main difference was rather the changed conditions resulting from peace and political unity. Prosperity increased. With Italy in the lead, each province developed its natural resources with increasing specialization of production. This led to greater expansion of trade between all parts of the empire (and beyond, as to India) and to a rise in the standard of living, especially in the cities, where the middle classes enjoyed a prosperous life.

Summary of Augustus' Achievements.—All this was the result of the long years of constructive work which was achieved by Augustus and his helpers, after he had abandoned the role of a revolutionary faction leader and had become both the sole master of the Roman world and at the same time a responsible statesman. He had reached a delicately balanced *modus vivendi* with the Senate and republican traditions; he had created an improved administrative system; he had developed a consistent frontier policy to replace the somewhat haphazard development during the republic and had counseled his successors to keep the empire within the boundaries he had established; he had created a standing army to hold these frontiers against barbarian attacks; he had tried to stem the decline in standards of behaviour in public and even private life, to make Rome a worthy capital of the new empire, to integrate Italian with Roman interests, and to centre the new order on a united Italy whose municipal life offered an exemplar to the provinces; and with the securing of peace he made possible the romanization of western Europe.

ALINARI

TIBERIUS. IN THE VATICAN MUSEUM

In an edict he once expressed the hope that he might be allowed to set the state on a firm and secure basis and as a result be regarded as the "author of the best possible government" (*optimi status auctor*), and that at death he might carry with him the hope that the foundations that he had laid for the *Respublica* would remain unshaken. In many aspects his hopes were fulfilled, but he failed to include within the *optimus status* one essential component, real and unfettered liberty.

5. The Julio-Claudian Emperors.—*Tiberius.*—The official account that Augustus himself gave of his achievements (*Res Gestae*) was set up at his death in A.D. 14 on his family mausoleum in Rome (a copy from Asia is preserved, the *Monumentum Ancyranum; see* ANCYRANUM, MONUMENTUM). But his achievements might well have been in vain if his authority had not been peacefully handed on to a successor. The transference of power was accomplished smoothly, not least because his stepson Tiberius, whom he had adopted and made a virtual co-regent with himself, was a soldier of great distinction and therefore the more easily commanded the loyalty of the legions. During his principate (14–37), however, Tiberius found it increasingly difficult to cooperate smoothly with the Senate despite a sincere desire to do so. The senatorial administration came to depend even more upon the will of the *princeps*, although the Senate now entirely replaced the people in the election of magistrates and its judicial activities increased.

Tiberius suffered from dynastic difficulties. The death of his nephew Germanicus, whom he was wrongly suspected of having poisoned, increased his unpopularity, while his son Drusus was murdered through the intrigues of Sejanus. The career of the latter, who stationed the praetorian guard at Rome (23), demonstrated the potential power of the praetorian prefect and the vulnerability of Tiberius, who trusted him until his final plot for supreme power was unmasked in 31 (*see* SEJANUS, LUCIUS AELIUS). Betrayed and suspicious, Tiberius was less inclined to check the abuse of the law of treason (*maiestas*) which Augustus had extended to protect the person of the *princeps;* professional informers (*delatores*) increased and treason trials multiplied, but the portrait that has come down to us from Tacitus, of Tiberius as a sinister tyrant whose rule ended in a reign of terror, is unduly coloured by Tacitus' own bitter experiences under Domitian. Even Tacitus admitted that the civil government during the first nine years of Tiberius' reign was good; it deteriorated during the last few years, but although he refused to enter Rome again, he still devoted care to public affairs (as during a financial crisis in 33).

His provincial administration also was good. In general he accepted the precept of Augustus not to extend the frontiers, although he did annex Cappadocia. In the north Germanicus was allowed to restore Roman prestige in Germany by campaigns beyond the Rhine (14–16) but not to annex territory east of the river (*see* GERMANICUS CAESAR). Disturbances in Africa, Gaul, and Thrace were crushed, but Judaea was restless under Pilate's administration (26–36), which was marred by other errors besides the crucifixion of Jesus Christ. Tiberius, however, usually chose

REGIONS, TOWNS, AND MAJOR ROADS IN ROMAN ITALY, ABOUT A.D. 14

good governors and was harsh to those who fell short. When disasters occurred he could be generous, as after an earthquake in 17 in Asia, which showed its gratitude by erecting at Smyrna a temple to Tiberius, his mother Livia, and the Senate. But Tiberius deprecated the spread of emperor worship and refused a similar request from Spain; he remarked that he was satisfied to be human and to occupy the first place (*principem*) among men. With this he had to be content even after death, since he was not granted those divine honours which he himself had secured for *Divus Augustus*.

Caligula.—The chief advantage of the principate of Gaius (Caligula, Germanicus' son; 37–41) was its brevity. Although it started hopefully, he quickly developed into a megalomaniac and tyrant, imitating Oriental ideas of absolute monarchy, encouraging delation, humiliating the Senate, increasing taxation, and spending recklessly. His military operations in Germany and his abortive threat to Britain did little to enhance his reputation, while his folly in provoking rebellion in Mauretania and in outraging Jewish sentiment in both Judaea and Alexandria was stopped only by his timely murder in 41. His conduct had subjected the Augustan system to a severe strain and emphasized the autocratic tendencies latent in the principate.

Claudius I.—Gaius' uncle Claudius, who reigned from 41 to 54, was accepted reluctantly by the Senate when he was thrust on it by the praetorian guard; senatorial hopes of a revival of the republic were exposed as unrealistic. Claudius reacted sharply from Gaius' autocracy and tried sincerely to cooperate with a Senate that despised him on personal grounds. He wished to rule well,

and in many ways he succeeded, although his achievements have been denigrated by a contemptuous or hostile tradition. His sense and knowledge of history impressed him with Rome's ability to introduce change without destroying essential traditions. Hence his thoughts turned to the more creative period of Augustus and even of Julius Caesar rather than to the more conformist years of Tiberius. The needs of a growing empire required a more centralized administration, so he built up the civil service in Rome by establishing special imperial departments under freedmen to deal with official correspondence, with petitions, accounts, judicial cases, and literary matters. These new imperial freedmen, who gained great power and wealth, were an offense to the senatorial aristocracy, a support to the emperor, and a means to greater efficiency in administration. Although he may not have established an imperial *fiscus* in Rome alongside the senatorial *aerarium*, he certainly tightened his control over finance. Desire for efficiency and a partiality for jurisdiction led him to improve the judicial system, but his hearing of many criminal cases privately *intra cubiculum* was unpopular and allowed his wives and freedmen to intrigue more freely. His revival of the censorship, which he held in 47–48, also gave offense to the Senate.

In foreign policy he abandoned Augustus' precept and followed his example, showing a preference for direct Roman rule in place of the use of client-kings. No fewer than five provinces were added: the two Mauretanias (*c.* 42), southern Britain (43), Lycia (43), and Thrace (46). Claudius also thought that now that Latin culture was being assimilated more widely, the time had come to extend Roman citizenship to those who had reached an adequate degree of romanization. Less careful of the privileges of Rome and Italy, he tried to improve the status of the provinces, especially in the west, by generous grants of Roman citizenship and municipal rights to individuals or communities; he also founded many colonies. Further, he admitted leading provincials, especially from Gallia Narbonensis, to the Senate. Augustus had made this body more representative of *tota Italia;* now Claudius was prepared to open it to worthy representatives of the provinces. This well-intentioned policy, however, contained the seeds of danger; the further undermining of the old governing class might lead to greater centralization of power in the hands of one man. So too the new bureaus were the seeds from which grew the gigantic bureaucratic machine which over two centuries later began to throttle the free life of the whole Roman world; but that was a development that Claudius could scarcely have foreseen.

In his domestic life he was less happy. Through the intrigues of his last wife, Agrippina, who probably poisoned him in 54, he was succeeded not by his own son Britannicus but by her son of a former marriage, Nero, a lad of not yet 17.

Nero.—The new principate (54–68) started well, since Nero was guided by his tutor Seneca and the praetorian prefect Burrus, but his reconcilation with the Senate did not last long and he gradually scandalized the aristocracy. Throwing off all controls, Nero murdered Britannicus (55), his mother, Agrippina (59), and his wife, Octavia (62), and forced Seneca into retirement. Instigated by the prefect Tigellinus, the successor to Burrus who may have died a natural death, Nero indulged his artistic passions with extravagance and excess. His unpopularity was increased by this conduct, by his reliance on Greek and Oriental freedmen, by his use of the treason law and his plundering of the rich, by the fire that ruined half of Rome in 64, by the Golden House that he built over the ruins, and by his excessive cruelty to the Christians, whom he tried to blame for the fire.

Disorders soon followed in the provinces. A more aggressive policy in the east led to a clash with Parthia and a great military defeat at Rhandeia (62), although the Armenian question was then settled through a display of Roman might by Corbulo, and the Armenian king came to Rome to receive his crown from the hands of Nero. A revolt in Britain, led by Boudicca (*see* BOADICEA), was successfully crushed (60–61), but a widespread rebellion blazed through Judaea (66–70), while provincial governors rose against Nero in the west: Vindex in Gaul and Galba in Spain. Nero had made the fatal mistake of not getting to know his armies. At home aristocrats, Stoics, army chiefs, and countless individuals

ANDERSON—ART REFERENCE BUREAU

NERO. IN THE MUSEO NAZIONALE, ROME

opposed and hated him. One conspiracy, led by Gaius Piso in 65, was betrayed and crushed. Finally the praetorian guard deserted their emperor. Nero fled from Rome and committed suicide. Thus the Julio-Claudian dynasty crashed amid rebellion and civil war, but the work of Augustus, Tiberius, and Claudius survived the disaster.

6. The Flavian Emperors.—Nero had no son, and no member of the Julian or Claudian families survived to claim the succession and maintain the link with Augustus. In the absence of a claimant at Rome, as the famous epigram of Tacitus emphasized, "a secret was revealed that an emperor could be made elsewhere than at Rome." It was not the Senate but the wishes of the armies in the provinces that settled the matter, although the armies recognized that their nominees were still pretenders until they were approved by the Senate. While all the armies had remained loyal to an heir of Augustus their separation on the various frontier provinces had proved beneficial by making any concerted action against the central authority more difficult. But now their geographical separation emphasized their differences of interest, and each army group wished to put forward the claims of its own commander.

Galba, Otho, Vitellius.—The movement started when Gaius Julius Vindex, a romanized Gaul and governor of Gallia Lugdunensis, revolted against Nero, probably desiring a better emperor rather than a restoration of republican authority or a nationalistic breakaway by Gaul. He was soon defeated by the legate of Upper Germany, Verginius Rufus, whose victorious troops offered him the empire. Verginius declined but finally gave his support to Galba, the governor of Hispania Tarraconensis, who had renounced his loyalty to Nero and secured the support of Otho, the governor of Lusitania. By October 68 Galba had reached Rome, where he was accepted by the Senate and the praetorian guard. But a series of tactless actions quickly alienated sympathy, and news soon reached him of the disaffection of the armies on the Rhine, which were proclaiming their leader Vitellius as emperor. Galba in vain hastily adopted as co-regent a certain Piso Licinianus, but this merely infuriated Otho, who was thus passed over. He won the support of the praetorian guard, which killed Galba, and Otho became emperor for three months (69). The armies of Vitellius boldly invaded Italy, where Otho managed to hold the line of the Po until he was defeated near Cremona; then, to spare his fellow countrymen from further fighting, he committed suicide in April. Vitellius soon exposed his personal incompetence and weakness as emperor, and the armies in the east, refusing to accept the choice of the Rhine armies, put forward a candidate of their own, T. Flavius Vespasianus, who was in command of the forces reducing the Jewish revolt.

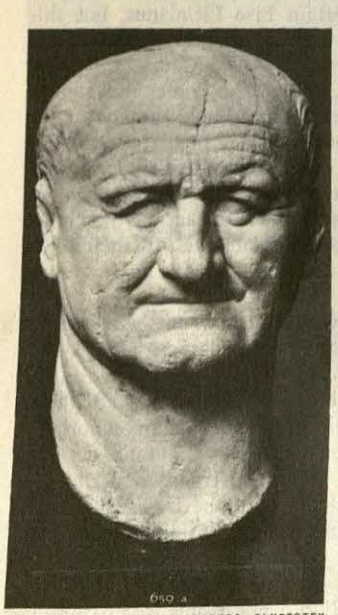
Vespasian.—Vespasian's future was assured when the armies on the Danube, which had favoured Otho, now declared for Vespasian. While Vespasian himself was organizing supplies in Alexandria and his supporter Mucianus, the governor of Syria, was advancing slowly toward Europe, Antonius Primus swooped down on northern Italy from Pannonia and, at another battle near Cremona, defeated the Vitellians. By December the Danubian troops had captured Rome and killed Vitellius. On Dec. 22 all the imperial powers, including unlimited rights of "commending" candidates for magistracies, were voted *en bloc* to Vespasian by the Senate and ratified by the people in a *Lex de imperio Vespasiani,* of which a partial copy survives. He himself did not reach Rome for over six months. It remained to be seen whether he would succeed in the daunting task of stamping out civil war, winning the allegiance

of all the armies, reestablishing orderly civil government, and above all of re-creating a widespread faith in Rome's future.

One of the first tasks of Vespasian (whose principate lasted from 69 to 79) was to quell two rebellions. Recent events in the west had given an impetus to the Jewish War, which Vespasian handed over to his elder son Titus. In 70 Titus besieged, captured, and destroyed Jerusalem; Judaea was made a province, and a Roman legion was stationed there. Even more serious was a rising of the Batavians of the lower Rhine district, led by Civilis, which started before the death of Vitellius. Civilis was soon joined by Classicus, a leader of the Gallic Treveri who hoped to form a new independent Gallic empire. The rebels smashed Roman power on the Rhine, destroying all but two of the Roman camps; that of Vetera held out during a bitter siege until 70. However, divergence of aims weakened the insurgents; eight legions were sent against them and the rebellion collapsed. Vespasian realized that the revolt had been facilitated by Roman troops quartered in the north who had been recruited locally. Henceforth auxiliary troops had to serve on frontiers far from their native homes; they were also to be less homogeneous and have Roman officers in place of native chiefs. The non-Italian element in the legions was increased by greater recruitment from the western provinces. Vespasian avoided Nero's mistake of neglecting the army, and he secured its loyalty; further, he reconciled it to the principate as such, even when this was no longer held by members of the Julio-Claudian family. More than a century passed before a *princeps* had serious trouble with the army. To secure the loyalty of the praetorian guard, Vespasian made his son Titus its prefect.

The fact that he had two sons was an inestimable advantage: he might hope to found a dynasty and thus minimize the threat of renewed civil war when he died. He therefore kept them in the public eye, sharing his powers and offices with Titus, who with his brother Domitian received the titles of *princeps iuventutis* and *Caesar*.

With the Senate Vespasian took a strong line. Although only 30 of the old republican families were still represented in it and a few provincials had come in under Claudius, he decided to make it more representative of the provinces. To do this he held the censorship, with Titus, in 73 (and perhaps annually thereafter), and he drew his new senators from the municipal towns of Italy and the west, although the east and Africa were not neglected (the first African reached the consulship in 80). He thereby infused a much healthier element into the Senate, and a new aristocracy of service arose. This was in line with Vespasian's own character; he was a hard-working, shrewd countryman from Sabine country, not a Roman aristocrat. But if the Senate now provided better administrators (there is only one recorded trial for provincial misgovernment in his reign), any claim it had tried to maintain to be a partner of the emperor disappeared; Vespasian might treat it with courtesy, but not on equal terms.



BY COURTESY OF NY CARLSBERG GLYPTOTEK

VESPASIAN. IN THE NY CARLSBERG GLYPTOTEK, COPENHAGEN

In finance he was faced with a treasury drained by extravagance and war; he therefore increased taxation (*e.g.*, he diverted to Jupiter the annual contribution that pious Jews had paid to the Temple at Jerusalem) and practised economy, introducing a simpler court life. Yet he spent where necessary, as with the building of the Flavian Amphitheatre, which we call the Colosseum. Much of his work antagonized the older nobility, but open opposition came only from republicans such as Helvidius Priscus, Stoics, and Cynics; Vespasian therefore banished itinerant philosophers. When he died in 79 he was deified and was succeeded without trouble by Titus.

DETAILS OF RELIEFS FROM THE ARCH OF TITUS, ERECTED IN THE FORUM A.D. 81

(Top) Titus standing in a *quadriga* (four-horsed chariot), led by Roma, while Victory crowns him; (bottom) triumphal parade in Rome of Jewish vessels (a seven-branched candlestick, table for the shewbread, and the sacred trumpets) removed after the sack of Jerusalem (A.D. 70)

Titus and Domitian.—Titus' brief but popular reign (79–81) was marked by lavish generosity and by the destruction of Pompeii and its neighbourhood through the eruption of Vesuvius in 79. His brother Domitian (81–96), who had been kept somewhat in the background, developed the tendencies to autocracy which had begun to show under Vespasian: he would be master of Senate, people, and army. He held the consulship frequently, assumed the title of *censor perpetuus* (from 85), entered the Senate in triumphal robes and exposed it as his servant, gave the *equites* more influence at the expense of both freedmen and senators, welcomed, although he did not demand, the form of address of *dominus et deus* ("master and god"), and probably made oaths by his Genius and sacrifice to his image a test of loyalty, which led to clashes with Jews and Christians. His costly buildings, games, and shows, and an increase in army pay, all required money, which he obtained by efficient administration and partly by confiscations (although the latter may primarily have been aimed at weakening aristocratic opposition). After the unsuccessful rebellion of Saturninus, governor of Upper Germany, in 89, Domitian was alarmed and allowed his fears and cruelty free rein. A period of terror followed, in which delation and treason trials flourished. Some senators, as Frontinus and Agricola (*qq.v.*), found safety in retirement from public life, and few senators could breathe freely until the tyrant was assassinated in 96.

Foreign Policy under the Flavians.—The foreign policy of the three Flavian emperors was directed less to extending the empire than to strengthening its frontiers. In the east, where the province of Cappadocia was flanked by the client states of Lesser Armenia and Commagene, Vespasian made a radical change: Cappadocia and Lesser Armenia were put under the administration of the governor of Galatia, and Commagene was added to Syria in the south, whose governor was now relieved of the supervision of Judaea, which had become a separate province. This reorganization, with legionary troops stationed in camps on the Euphrates, and with the two major provinces of Galatia and Syria now facing Parthia, secured peace in the east for nearly half a century.

On the Rhine frontier the Flavians decided to annex some territory east of the river and guard this with forts and troops. In 74 Vespasian annexed the Agri Decumates in the Black Forest area, thereby eliminating the awkward angle between the sources of the Rhine and Danube. He also penetrated up the lower Neckar Valley, and later Domitian defeated the Chatti and encircled the Taunus Mountains (83–84). After the revolt of Saturninus in 89 this new frontier was consolidated by establishing Upper and Lower Germany as two "provinces" with some kind of civil as well as military organization. Farther east the Dacians who lived north of the Danube (in modern Rumania) crossed the river and invaded Moesia in 85. After an initial defeat the Romans won a victory at Tapae in 88; Domitian came to terms with Decebalus, the Dacian king, and agreed to pay him an annual subsidy. Domitian did not regard this as a great achievement.

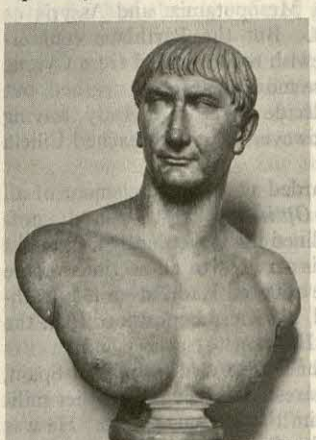
In Britain also there was further advance. Petillius Cerialis moved north to Eburacum (York) and reduced the Brigantes (71–74), while his successor, Frontinus, conquered the Silures in southern Wales (*c.* 74–77). Gnaeus Julius Agricola then overran north Wales and northwestern Britain, and penetrated into Scotland. After his victory at Mons Graupius he was recalled by Domitian (84); his conquests in the north were held for some years, but the frontier was then drawn back to the line of the Solway and Tyne; to hold the north would have involved maintaining in Britain a permanent garrison of four instead of three legions.

Thus Rome and the empire owed much to the Flavians. Like Augustus, Vespasian had to restore peace and order at home and abroad after civil war; both men succeeded in establishing stable government. If the relations between emperor and Senate deteriorated and the former edged a little nearer to autocracy, at least all men had been given renewed confidence in Rome's *aeternitas* (if Vespasian had failed, the 3rd-century breakdown might have occurred two centuries earlier) and they began to look for their well-being to the *providentia* of the emperor. A firm foundation had been provided for the prosperity which was to reach its climax in the days of the Antonines.

7. The "Five Good Emperors."—*Nerva.*—Domitian left no heir, and the threat of renewed civil war was heavy, but his murderers had been careful first to choose as a candidate an elderly jurist and senator, M. Cocceius Nerva, who was remotely linked through his mother to the Julio-Claudians. The crux was whether the army would acquiesce in a nominee of the Senate. In fact, after some early murmurings, it did, and the principate was saved; well might the coin types proclaim *Roma Renascens* ("Rome reborn"). To the Senate Nerva naturally showed deference and he tried to uphold constitutional practice; thus Pliny could speak of the restoration of constitutional government (*libertas restituta*), and Tacitus of the blending of such government and the principate, which had formerly been incompatible. Nerva tried to gain goodwill by various acts of generosity and by damning the memory of the tyrant Domitian. One of the most important measures attributed to him was an alimentary scheme (*alimenta*) to help the small farmers of Italy, to relieve poverty, and to stimulate the birth rate. But he had two weak spots: he had no son to succeed him, and his lack of military experience made the support of the army uncertain. He therefore adopted an heir who would commend himself to the army and keep the praetorians in hand (they had forced Nerva to allow the execution of the murderers of Domitian). He chose wisely in making M. Ulpius Traianus his heir and co-regent, since Trajan was a distinguished soldier and governor of Upper Germany. This move was highly significant in two respects. First, Trajan was of Spanish descent; the choice was the logical conclusion of the liberal policy that Claudius and Vespasian had advocated for the provincials. Second, the principle of adoption was now used in place of dynastic succession; the principate was opened to talent, and the result was the so-called five good emperors.

Trajan.—When Nerva died at the beginning of 98, Trajan succeeded without a hitch to an empire which owed much to Nerva despite the brevity of his reign. He had averted the recurrence of civil war and established better relations between Senate and *princeps*. These were maintained and enhanced by Trajan (98–117) through his tactful and attractive personality. His power was no less than that of Domitian, but he used it differently. Both Pliny in his *Panegyricus* and Dio Chrysostom in his discourse *On Kingship* depicted Trajan as the first servant of the state, unchallenged, but a leader rather than a lord, *princeps*, not *dominus*. Trajan avoided honours, held the consulship seldom, treated the Senate with respect, punctiliously consulting it and reporting to it, and recognizing the moral influence that it exerted, while he mixed with individual senators as their social equal. Although he did not add to the Senate's power, he banished the atmosphere of suspicion and conspiracy which was Domitian's legacy, and he bequeathed to his successors a tradition of mutual respect between *princeps* and Senate.

This is the more remarkable since he did not hesitate to intervene in the senatorial sphere in the interest of efficiency. Thus he improved public works in Italy (*e.g.*, the Via Traiana), insisted that senators should invest one-third of their capital in Italian land, and sent out officials named *curatores* to take over the financial administration in some cities in Italy (and in the provinces). When he found that the senatorial province of Bithynia was in financial difficulties he temporarily took it over and sent out as governor the younger Pliny, whose correspondence with the emperor throws much light not only on conditions in Bithynia (*e.g.*, the position of the Christians there) but on imperial administration in general. This well-meaning interference marked a beginning of the paternalism which was increasingly shown by the central government. Trajan's concern for Italy is also indicated by his development of the alimentary system. In administration he made further use of *equites* in place of freedmen. He spent lavishly on public buildings (as his Forum and Column), especially when gold began to reach Rome from the mines of conquered Dacia, and he made many distributions of money (*congiaria*) during his reign. Thus he gained the support of the people and Senate. He was no less popular with the army.



BY COURTESY OF THE TRUSTEES OF THE BRITISH MUSEUM

TRAJAN. MARBLE BUST FOUND IN THE ROMAN CAMPAGNA. IN THE BRITISH MUSEUM

Near the beginning of his reign Trajan determined to annex Dacia. This was an important change in imperial policy. As Claudius earlier had felt that the time had come to advance Augustus' frontiers, so Trajan apparently judged the time ripe for further expansion after the very moderate changes since Claudius' time. Also he may have regarded Domitian's peace terms with Dacia as unworthy of Rome, and thought that the Danube frontier would be more secure if a bastion of Roman territory was thrust into the land north of the river where it would separate and check the barbarian tribes. The conquest was completed in two campaigns (101–102 and 105–106). Decebalus committed suicide, Dacia was annexed as an imperial province, and its capital, Sarmizegethusa, was made a colony, Ulpia Traiana. The impact of Rome was such that a Latin language (Rumanian) is still spoken in this

MANSELL—ALINARI

DETAIL FROM TRAJAN'S COLUMN, ROME
Roman soldiers defend their garrison from an assault by Dacian forces

area. One legion was stationed in the province. With three on the lower Danube, two in Upper Moesia, and four in Pannonia, ten legions now held the Danube front.

Trajan also determined on advance in the east. On the death of Agrippa II, Transjordania had been added to Syria (probably in 93), and in 105–106 Arabia Petraea or Nabataea was quietly annexed as an imperial province. The southward movement of Caucasian tribes, as the Alans, together with Parthian interference in Armenia, might have provoked a limited Roman intervention, but Trajan's aims went further: Parthia was to be challenged. He advanced swiftly over the Euphrates and captured Ctesiphon, the Parthian capital, adding Armenia, Mesopotamia, and Assyria as new Roman provinces (114–115). But the Parthians counterattacked in Armenia and a great Jewish revolt spread from Cyrene to Egypt, Cyprus, and Asia. These movements were crushed, but Trajan was reluctantly forced to decide to return to Italy, leaving Hadrian in charge in the east. However, when he reached Cilicia he died (117).

This blunt soldier was later regarded as the most clement of all the emperors, while the title of *Optimus* ("best"), used unofficially since 100 but modestly declined by Trajan until 114, might then seem to have been won by his services to all sections of the Roman world. Whether or not he adopted Hadrian on his deathbed, as his widow Plotina asserted, is of less importance than the fact that he indubitably intended Hadrian to succeed him.

Hadrian.—Hadrian, who came of a senatorial family in Spain, was Trajan's second cousin and nearest relative. His earlier military career and experience made him the obvious choice. He was accepted by the army and by the Senate, to which he wrote apologizing that he had not been able to consult it about his adoption. His interest in the empire was keen and personal, as his two long tours of the provinces showed (121–125 and 128–134), but he believed that Trajan's expansive policy imposed too great a strain on the resources and perhaps the manpower of the empire. Hence he abandoned Assyria, Mesopotamia, and Armenia, though retaining Dacia, and strengthened Rome's ties with vassal kings around the frontiers. The frontiers themselves were to be delimited and further fortified. In particular he erected fortifications on the Rhine-Danube frontier, and in Britain, where after the annihilation of one of the legions he constructed the Wall for 73 mi. from Tyne to Solway.

The only serious war resulted from Hadrian's determination to reconstruct Jerusalem as Aelia Capitolina in 131, and other anti-Jewish measures. These provoked the bitter revolt led by Bar-Cochba (*q.v.*), which caused widespread devastation and heavy casualties before it was crushed in 135. Thereafter Jews were forbidden to get within sight of Jerusalem (Aelia), and Judaea, renamed Syria Palaestina, was garrisoned by two legions.

But peace depended above all on maintaining the spirit of the army. By intensive training and frequent inspections Hadrian tried to improve its fighting qualities. He extended local recruiting so that even many of the legionary officers ceased to be Italians (only the praetorians remained predominantly Italian), and many of the differences between the legions and *auxilia* disappeared. In the higher commands he did not exclude senators but he employed more *equites*.

Hadrian's outward relations with the Senate were cordial enough, but he recognized its increasing inefficiency and narrowness of view and therefore he tended to gather more power into his own hands; relations became more strained at the end of his reign. In particular his creation of four consular judges in Italy violated the Senate's traditional sphere. Further he impinged on senatorial administrative duties by his reorganization of the imperial council, in which lawyers and *equites* predominated. He substituted *equites* for freedmen in the imperial household and bureaus and built up the civil service on the basis of the equestrian order; by making military service no longer obligatory, he created a purely civil equestrian career with a hierarchy of grades and honorary titles (as *vir egregius, perfectissimus,* and *eminentissimus;* senators became *clarissimi*). Hadrian's legal work was outstanding, in particular the codification of the *edictum perpetuum,* the law interpreted

BERNARD G. SILBERSTEIN—RAPHO GUILLUMETTE

HADRIAN'S VILLA AT TIVOLI

by the praetor's edict. He also created a new form of Latin rights, *Latium maius,* which gave Roman citizenship to all the local senators (*decuriones*) of the towns which received this right. At the same time more members of the Senate in Rome were recruited from the provincial nobility both in the east and west; senators who looked back to the old traditions of Rome may have despised Hadrian's love of things Greek.

Since Hadrian had no children, an illness in 136 prompted the adoption of L. Aelius Verus. After the latter's death in 138 Hadrian adopted Antoninus Pius, a man of 51 and a respected senator. He also looked to the future, making Antoninus in turn adopt two sons, Marcus (later Marcus Aurelius), who was Antoninus' own wife's nephew, and L. Aelius, the son of Verus.

Antoninus Pius.—Unlike his predecessors, Antoninus did not leave Italy during his principate (138–161) and by living the life of a country gentleman he directed attention to Italy away from the more cosmopolitan ideas of Hadrian. He thus worked well with the Senate, even abolishing the consular judges of Italy, though in fact he gave it no fresh powers and maintained the centralizing policy of his predecessor. Abroad he tried to strengthen the *limes* (*q.v.*) in Britain and in Germany by building a second wall in Britain (from the Forth to the Clyde in Scotland) and also in Germany. There were minor disturbances in Britain, Dacia, North Africa, and Judaea, while Antoninus installed vassal kings to rule the Quadi on the Danube, the Lazi in Colchis, and the Armenians; this was accomplished without serious trouble with Parthia. In 147 he celebrated the 900th anniversary of Rome in an age when men could speak of the *felicitas saeculi* ("happiness of the age") with real feeling, and Aelius Aristides could deliver a eulogy of Roman rule. But there was a touch of autumnal chill in the warm air of the Indian summer.

Marcus Aurelius.—As soon as Antoninus died his successor, Marcus Aurelius, asked the Senate that his "brother" Lucius Verus be given tribunician and proconsular power and the title of *Augustus;* he thus received a colleague and the principate was made collegiate. It is anomalous that Marcus, who was a Stoic philosopher and not a soldier by inclination, had to spend no less than 16 of the 19 years of his rule (161–180) in warfare. The frontiers were threatened in east and north. When the Parthians seized Armenia and defeated two Roman armies, Marcus sent out Verus (162), but it was Avidius Cassius who invaded Mesopotamia, captured Ctesiphon, and ended the war (166). Unfortunately Verus' troops brought back with them a virulent plague which probably left a permanent mark on the strength of the empire which it ravaged (165–166). At this moment German tribes (the Marcomanni and Quadi) broke over the Danube and even attacked north Italy, while the Iazyges attacked Dacia. After the tide had been stemmed (and Verus had died, in 169), Marcus planned to annex extensive territories north of the Danube in central Europe. In a series of campaigns (169–175) he defeated the three tribes and was on the point of creating new provinces of Marcomannia and Sarmatia when news came of the rebellion of Avidius Cassius, who had been left in supreme command in the east (he had quelled a revolt in Egypt in 172).

Avidius was soon murdered, but in 177 Marcus had to return to the front to repel further attacks of the Marcomanni and Quadi, leaving his son Commodus in Rome with the title of *Augustus* and the authority of a co-regent. Marcus' campaigns went well and he would soon have annexed his enemies' territory, but he died suddenly, and Commodus promptly renounced his father's policy of annexation. It soon became clear that Marcus' rejection of "the choice of the best" and his return to a dynastic policy without regard to the personal qualifications of a son and heir were not without grave dangers to the empire, whose economic and social life had already suffered severe blows from war and plague.

MARCUS AURELIUS IN A QUADRIGA (FOUR-HORSED CHARIOT) ENTERING ROME IN TRIUMPH; FROM A RELIEF IN THE PALAZZO DEI CONSERVATORI, ROME

At home Marcus showed goodwill to the Senate, though bureaucracy increased, and circuit judges (now named *juridici*) were revived for Italy. Despite all his devotion to duty and his care for jurisdiction and finance, he lacked the constructive imagination to infuse fresh life into a reasonably contented but wearying world. It is, however, scarcely fair to blame him for his failure: the "self-sufficiency" of the Stoic philosopher was a limiting ideal, while the growing and relentless pressure of the barbarians upon the frontiers claimed too much of his energy; only in the intervals of his campaigns could he turn to his *Meditations.*

8. The Empire in the 2nd Century.—It is natural to speak of the Antonine "monarchy." In appearance, and to a very considerable degree in fact, the principate retained the civilian basis that Augustus had created for it, but in practice the charismatic and autocratic aspects of the ruler were increasing, and, despite the great gifts of the five "good" emperors in humane and effective government, there was a strong progression toward the dominate or autocracy. True, the Senate, as representing the state, remained the one legitimate source which bestowed on an emperor all his powers, but the Senate's hands were already tied, occasionally by the praetorians in Rome (as with Claudius) or by the frontier legions (as in 69), but normally by the ruler's own choice of a successor, whom usually he had raised to collegiality and had adopted as his son if he had no son of his own.

The ruler's powers, which for Augustus had comprised an accumulation of separate grants, retained an apparent diversity (even though conferred in a block grant), so that an emperor might act

in his role as censor or *pontifex maximus,* but in practice the *imperium,* which Augustus had tried to keep in the background, became the decisive element, by which he commanded the armies and controlled the revenues; personal names and titles, as *Imperator Caesar Augustus,* became signs of power. Less the recipient of various powers, he now exercised a general *imperium* as head of the state: he controlled the composition of the senatorial and equestrian orders, he granted Roman citizenship, together with political, social, and economic benefits, and he watched over men's moral and religious activities. In the interest of efficiency he had built up a civil service dependent upon himself, with increasing bureaucratic control from the time of Hadrian. Hence greater centralization and paternalism of government. He relied more and more upon the "friends of Caesar," the *consilium principis,* and on the help of the prefect of the city and the praetorian prefect; and by the imperial constitutions he had taken over the legislative functions of the *comitia,* which died a natural death (the last law passed by it was in A.D. 98). Little wonder therefore that throughout the empire men began to regard the emperor as benefactor and saviour: benefactor as securing the prosperity of the empire, saviour as guarding it against the barbarians beyond.

The increasing military needs, however, tended only to emphasize the emperor's military power and paved the way for the ultimate triumph of the military over the civil authority. The *princeps* was still very far from being a military dictator, yet he was an "emperor." However, if the people had no voice in the direction of affairs, at least the emperor was expected to rule in the interests of the governed, and thanks to the personal qualities of the emperors from Nerva to Marcus Aurelius they did rule with a full sense of their duties and responsibilities. By careful economy and a modest court the emperors could be liberal in public expenditure, with *alimenta* and *congiaria,* planning public works and endowing education, although the *fiscus* began to feel the strain under Marcus Aurelius.

Political Life.—The nature of the relations of *princeps* and Senate was still the final touchstone of the worthiness of an emperor. The Senate still enjoyed great prestige, though it recovered nothing of its earlier powers as an instrument of government. Augustus might appear as its servant, Marcus Aurelius was clearly its master. There was no serious senatorial opposition to principate or *princeps* after the Flavian period. In composition too it was very different from the Senate of the late republic. A few, but very few, men of the older republican nobility survived to reach the consulship in the Julio-Claudian period, but most of these families had fallen into obscurity or extinction. Augustus had reinforced the Senate with the "flower of Italy," wealthy men of the equestrian class from all parts of the peninsula. Gradually the civilized regions of the west began to supply a small number of senators, and after Claudius provincial senators became more common, at first mainly from Italian families abroad, but after Nero some descendants of native provincials.

The increase in senators from both west and east, men whose main wealth was in the provinces, made the Senate more representative of the empire as a whole, but it also meant that the real interests of many senators no longer lay in Italy (hence Trajan's measure that some of their property should be invested in Italian land). Emperors tried to strengthen the patriciate as a social elite; they used their right to grant this status chiefly to elevate men of Italian rather than provincial origin. There was much greater social mobility than earlier; families could rise in two or three generations even from freedmen status to high society. This was all the more necessary since many senatorial families, both Italian and provincial, failed to perpetuate themselves and had constantly to be reinforced by fresh blood. The new families, although providing good administrators, failed also to stimulate the Senate to creative activity; it realized too clearly its dependence on the emperor's goodwill and guidance. But membership was still highly coveted, and the social gulf between senators and the upper middle class became ever wider.

Nevertheless the Senate was still more than a mere social class; it played an active, though not a controlling, part in legislation and jurisdiction as well as in administration. It looked with favour at the decreasing use of imperial freedmen, but askance at the increasing activities of the equestrian order. On the other hand friction between the two orders was lessened by the clear demarcation of their spheres of duty, while they were drawn closer together by two circumstances: the knights were socially much closer to the senators than to the rest of the population, and it was from the equestrian order that the emperors normally chose the new senators.

In both the equestrian order and the army tendencies were developing which were to increase the significance of each group in the following century. The army, which still effectively held the frontiers, was becoming less mobile and predominantly provincial. While the praetorian guard and the urban cohorts retained a Latin tradition, the bulk of the provincial soldiers, although good fighters, were only superficially touched by Roman political ideas or Greco-Roman culture, while the higher officers, as a result of the widening gap between military and civil careers, had little experience in civil government even though the majority may still have been of Italian stock.

Social and Economic Life.—Although many of the difficulties of the 3rd century were foreshadowed before the end of the Antonine age, Edward Gibbon's famous words, that the human race was never happier than in this period, may well be true, at any rate until his day. Urbanization reached its widest extent in the provinces, where the governing aristocracies were often public-spirited men who spent generously to endow and maintain their own cities. The municipalities flourished as never before, although on occasion the financial strain of compulsory contributions imposed on the local magistrates and senators proved too heavy, and the Roman central government was forced to limit their liberties in order to support their finances or to maintain public order. The care which the emperors exercised in the provinces is attested in Trajan's correspondence with Pliny and by Hadrian's tireless tours, while these emperors' own provincial origin naturally inclined them to generosity in granting Roman citizenship, and so prepared the way for the final act when Caracalla in 212 granted citizenship to all communities within the empire.

With peace predominant throughout Mediterranean lands and with the extension of the road system and the improvement of communications, the empire reached its peak of economic development. In agriculture and industry the provinces began to outpace Italy. There were few improvements in industrial technology or organization, but some new sources of raw materials were obtained, and commerce by land and sea flourished as never before, bursting the bounds of the empire to reach Scandinavia, overland to China, and through the Indian Ocean to the east. This increasing prosperity was reflected in the growth of cities, while other new towns grew out of *canabae,* the settlements of traders around the military camps. The new buildings in Rome, such as the Colosseum, Trajan's Forum, and the Pantheon, found their counterparts in the fora, theatres, amphitheatres, baths, aqueducts, and bridges which increasingly adorned the chief cities in the provinces. Roman sculpture, which reflected many of Rome's imperial achievements, kept pace with architecture, and imperial ideals often reflected the artistic traditions of the provinces.

In contrast with the creative genius of certain epochs, some would speak of the "intellectual stagnation" of this period, yet schools and libraries showed the interest of state and private benefactors in education. Literature entered upon its Silver Age with the work of Tacitus, Suetonius, Quintilian, Pliny, Fronto, and Apuleius, of Martial and Juvenal, although admittedly the output began to decline as time advanced. There was a revival of Greek letters, Christian apologists developed a new branch of literature, and Roman jurisprudence reached its maturity. In all spheres, and especially in the religious, provincial influences spread, and the western stamp which Augustus had set upon the empire gradually became less clear-cut. Christianity, despite intermittent persecution, had taken root in Italy, Africa, and Gaul, and was developing an organization which ultimately could challenge the imperial regime.

Rome had imposed no uniformity of culture but had allowed the provincials to retain their varied customs and institutions, al-

THE ROMAN EMPIRE, A.D. 14 TO 116

though naturally romanization had spread widely, not least by means of the armies on the frontiers. The predominantly Latin culture of the west was complementary to the Hellenism of the east. But despite diversity there was a bond of unity, and all men looked to the emperor as to a universal Providence by whose unremitting care the *pax Romana* was preserved.

There was of course another side to the picture. Many grave problems, as the social evils of slavery and the pauperization of urban populations (increased under Marcus by plague and famines) or the possibility of a wise policy of decentralization and provincial representation, were not tackled. Further, the culture of the empire meant less to the toiling masses in the provinces than to the middle and upper classes, for whose benefit the empire chiefly existed, while many future unhealthy changes were already foreshadowed. Nevertheless, the barriers between Rome and the provinces had fallen, Italy had lost its privileged position, and in an age of greater goodwill and humanity, the stability of the empire and the *Aeternitas Populi Romani* must have appeared unshaken and unshakable. (H. H. Sd.)

From this point, political history is covered in detail in the articles on individual emperors (*see* tables); further information is also given in articles on individual provinces (*see* table in Province, Roman). This article deals henceforward chiefly with the social and economic development of the Roman Empire.

9. The Empire, A.D. 180–284.—Marcus Aurelius died in 180. Half a century later, the elderly senator and historian Dio Cassius commented that with his death "the age of gold turned to rusty iron." Like most ancient and many modern writers, Dio Cassius blames the personal character of Marcus' successors. But the rust had set in earlier. Marcus had been continuously at war longer than any of his predecessors. His Parthian campaign achieved a sensational victory, but the victorious armies brought the plague back. He was decisively beaten, beyond the Danube, by the Germans, who devastated the Balkans, some forces reaching Italy, where no armed enemy had penetrated for 250 years. When the frontiers were recovered and Marcus determined to annex Bohemia and Moravia, his initial victories were thwarted by the revolt of Avidius Cassius.

When Cassius was dead and his supporters stilled, Marcus resumed the offensive but died in March 180. The accession speech of the young prince Commodus, certainly composed by the general Pompeianus, proclaimed the goal of continuing the war until Roman arms reached the Ocean.

But the ambition of the generals was wrecked by the numerous internal tensions bred of the long war. Two among them are immediately apparent: social discontent, and the diverging interests of the Latin West and Greek East. The long war had produced very many deserters, who, a few years after Marcus' death, were strong enough to seize a number of towns in southern Gaul, with the help of poor townsmen. A full-scale army was required to subdue them. Beaten in the field, they infiltrated Rome, where the audacious plot of their leader Maternus to seize the imperial throne was checked by treachery. It was the first internal social rising recorded since the days of the Republic, and it was soon followed by others. Twenty years later a bandit leader, Bulla Felix, with a force of runaway slaves, deserters, and bankrupts, terrorized southern Italy for two years, while from the later years of Marcus onward the lawyers emphasize the difficulty of telling a slave from a freeman and fulminate in vain against landlords, short of labour on their estates, who accept and shelter strangers without inquiry into their origins. The social discontent continued throughout the 3rd century, gaining strength from the

divisions among men of wealth and power.

The long war sharpened the inherent mutual suspicions of the Latin-speaking and Greek-speaking provinces; for, until the end of the century, the Senate remained overwhelmingly Latin, the far wealthier provinces of the east being proportionately ill represented. Surviving sources are too slight and too heavily biased toward the Senate to permit more than a few hints of the degree and articulateness of this feeling, but as early as 180 a contemporary African Latin inscription had described the revolt of Cassius as *motus orientalis*, "the rising of the east." The resources of the eastern provinces and the social cohesion of the empire were alike squandered on a vain attempt to subdue the unprofitable forests of Germany. It was not many months before the young emperor was induced to dismiss Pompeianus, end the Danubian war, and place his confidence in a Bithynian Greek, Saoterus.

The reaction was violent; Pompeianus' son tried and failed to murder Commodus, but the aristocracy succeeded in murdering Saoterus and in placing the Italian prefect Perennis at the head of affairs. The emperor was a great deal more interested in sport than in politics and acquiesced when a *Putsch*, initiated by the officers of the army of Britain, whose morale had recently been smashed by a disastrous defeat, removed Perennis. The next prefect, an easterner, was destroyed in a city riot organized by a rival, who fell soon after. The urban plebs and the guards came again to exercise a political influence denied them for many years under the stable empire. The chaos ended in civil war, and the victor, Septimius Severus (193–211), strove with temporary success to restore the old stability, while his wife, Julia Domna, patronized the syncretist philosophers who sought to show that Oriental, Greek, and Latin religion, philosophy, and myth were but variant expressions of a single universal truth. Severus' two sons were bitter enemies, each attracting opposing factions throughout the empire. Seeking to avert the risk of civil war, the imperial council discussed a proposal that one brother should rule the eastern provinces, with a Senate of all Greek-speaking senators, while the other ruled the west with a Latin Senate. The proposal was rejected and a simpler solution found in the murder of the younger brother. But the proposal anticipated the later division of the empire, whose causes were already present.

The senatorial writers of the 4th century saw the period between the Severan emperors and Diocletian as a uniform half-century of military anarchy, a concept that has left a deep imprint on modern writers. But this harsh schematic presentation is much too simple; the only valid sharp and sudden break with the past lies in the disasters that overtook the Roman world about the year 260. Before then, evolution was jagged and complex, determined by the uneven effect of long-term and slow-growing changes. Under the early emperors, the population had consisted of a small number of Roman citizens, mostly Italian, and almost all from the Latin Mediterranean west, who ruled alien non-Roman subjects. The outlook of the Latin senators derived from this tradition, but two centuries of ever-widening franchise had made it long out of date, when, in 212, Caracalla abruptly bestowed Roman citizenship on all freeborn inhabitants of the empire. The legal equality of Syrian, Briton, and Italian scarcely became fully accepted in social and political practice till the 4th century, but it expressed and accelerated changes unwelcome to the aristocratic tradition; the established aristocracy fought tenaciously for its ancient privilege.

When Caracalla and his effeminate cousin Elagabalus were removed, the throne passed in 222 to a docile child, Alexander Severus, in whose name the empire was governed by a council of 16 senators, elected by the Senate to advise and control his mother. Their rule was precarious in Rome, where people and guards, in all else mutually hostile, united in dislike of the government, and they faced several provincial revolts. Their authority was destroyed by a military disaster in Persia, directly caused by the cowardice and incompetence of the emperor and his mother. When Alexander soon after bought peace from the Rhineland Germans, the angry troops killed him in 235 and proclaimed Maximinus (Maximin) the first professional soldier emperor. But the senators were not yet beaten, and in 238 they successfully organized a rebellion of Italy, which defeated and killed Maximin. But the Senate was too tied to tradition to exploit success; tradition enjoined that when the Senate chose an emperor, it should select the oldest available noble, preferably childless, whose senile function was to appoint a successor the Senate welcomed. Galba had chosen ill, Nerva well, and Pertinax had had no time to choose. Now the Senate chose colleagues, and chose former city prefects, Maximus and Balbinus, both well hated in Rome. People and guards dictated their own choice, the younger Gordian (Gordian III, then about 13 years old), and then made away with the Senate's emperors. Successive prefects struggled to control the boy, and the last of them, Philip, an *eques* from Arabia, succeeded him. Philip faced four successive revolts by senatorial army commanders, the last of which, led by Decius in 249, succeeded. Decius and his successor Gallus both belonged to the aristocracy, and a large influence fell to Valerian, a veteran of the Italian rebellion of 238, who ultimately succeeded Gallus in 253.

Valerian recognized that it was no longer possible for one emperor to control the whole empire, and appointed his son Gallienus to rule the west while he went to the east. But he was too late. Successive rebellions had demoralized the Danubian legions, which were scarcely in shape to withstand their old enemies and now faced the formidable new confederation of the Gothic empire. The frontier crumbled, and the Goths wasted northern Asia Minor and much of Greece. Before the emperors could intervene, Valerian was taken prisoner by the Persians.

Gallienus' energy recovered the Balkans and secured Italy. But the Rhineland, with Gaul, Spain, and Britain, and the eastern provinces acknowledged independent regional rulers, whom Gallienus could not even attempt to subdue. Gallienus drew the moral of the disaster; the frontiers had been demoralized by senatorial commanders who rebelled, so he forbade senators to command armies. It was the sharpest possible break with immemorial Roman tradition, and with few exceptions (most, perhaps all, under Aurelian) the new rule was permanently applied. Gallienus also raised a mobile cavalry reserve, henceforth the elite of the army. In his later years he faced a catastrophic inflation and renewed invasions, which culminated in the physical destruction of much of central Gaul.

Gallienus' edict did not end revolts. It was too late: now non-senators might also become emperors, and Gallienus was replaced by his own equestrian cavalry commanders, Claudius and Aurelian, who reduced the separate emperors of east and west to obedience. These men, and their successors, were professional equestrian officers, whose rule rested on a military crisis but gave no greater guarantee of stability than the rule of senatorial emperors. The murder of Aurelian gave the Senate a last belated and unexpected chance, for the army council, disillusioned at the small authority

of military emperors, asked the Senate to choose a successor. After six months' debate, it chose again the oldest available childless senator, the feeble Tacitus. He had no opportunity to designate a successor, and no one again troubled to ask the Senate to choose an emperor. The able praetorian prefect Probus took charge, and after him Carus, who seems to have died a natural death. There seemed no inherent reason why the army's next choice, Diocletian, should last longer than his predecessors, save that he had the wisdom to follow Valerian's example and appoint a loyal colleague to rule the west while he campaigned in the east. But the Roman world was weary of perpetual change and repeated disaster; though Diocletian faced as many rebel emperors in his first few years as any of his predecessors, none of the rebels found sufficient support to succeed.

In the crisis of Gallienus' reign, almost all the Roman world except central and southern Italy was overrun by barbarians. It is remarkable that the empire had strength to survive another century and a half. Recovery was achieved, partly because the barbarians came only to raid and were not yet familiar enough with Roman ways to settle within the frontiers, partly because the centuries of orderly Roman life were still recent and gave the empire a confident toughness strong enough to offset the shock of disaster and enable individual generals and emperors to repair the worst of the damage. But the disasters altogether killed the old financial and administrative system of the empire, destroyed the ancient authority of the Senate save in the eyes of its own members, and effaced the old preeminence of Italy. Diocletian's 20 years gave him the opportunity to consolidate and systematize the many military and administrative changes the crisis entailed, to organize them around a new centralized and unifying monarchy.

The disruptive crisis and the new unity had destroyed the force of old religions and philosophies; throughout the century, successive rulers strove to achieve a unity of ideas, grouped around a syncretist philosophy, neo-Platonism, or the worship of the unconquered Sun. Its common experience was that all older cults and philosophies were willing to sink themselves in each successive fashionable compromise, except the Christians. Decius, Valerian, and Diocletian therefore persecuted the Christians as enemies of the state, of Roman unity. Under Diocletian's successors the failure alike of the artificial world religions and of the persecutions forged Christianity into the unifying religion that the new empire needed. (X.)

B. The Dominate, A.D. 284–476

1. Diocletian and Constantine.—When Diocletian was proclaimed emperor on Nov. 20, 284, the barbarians had been repelled and the territorial integrity of the empire restored, but much remained to be done to repair the disorder and instability created by the anarchy of the preceding generation. Above all the constant military revolutions had to be checked and political stability restored. This Diocletian achieved, reigning for more than 20 years before he abdicated on May 1, 305. His success was mainly due to his sharing the government of the empire with loyal colleagues. In 285 he made Maximian Caesar and in 286 Augustus to rule the west, and in 293 he created two Caesars, Constantius and Galerius, to assist Maximian and himself. The four emperors were able to maintain close touch with all the armies and hold their loyalty; there were in fact only two rebellions, that of Carausius and Allectus in Britain (286–296) and that of Domitius Domitianus in Egypt (296–297). Diocletian also attempted to enhance the dignity of the imperial office by adopting Persian court ceremonial. Like his immediate predecessors, he claimed a quasi-divinity, styling himself Jovius, vice-gerent on earth of Jupiter Optimus Maximus. Maximian was styled Herculius, a title which emphasized his subordination to Diocletian.

†The terms West and East are used for convenience here, not to denote a split in the empire.

Diocletian greatly increased the size of the army, perhaps doubling its numbers, and strengthened the fortifications of the frontiers. He made no great change in its organization. Each emperor had a small mobile field army (*comitatus*), but the bulk of the forces were as hitherto stationed on the frontiers. In some frontier provinces he separated the military command from the civil administration, appointing a *dux* in addition to a *praeses*. He increased administrative efficiency by subdividing the larger provinces and grouping them in 12 larger circumscriptions called dioceses, governed by *vicarii* (*see* below).

Diocletian attempted to reform the coinage, issuing good gold and silver coins. He continued, however, to issue silver-washed copper *nummi* in vast profusion, and prices (including those of gold and silver) continued to rise. He endeavoured to fix prices and wages by edict in 301, but goods vanished from the market, and prices had to be allowed to take their course. Despite this failure he placed the imperial finances on a sound footing by organizing on a systematic basis the requisitions in kind (*indictiones*) on which the government had come to depend for feeding and clothing the army and the civil service and for providing labour and materials for public works. The *indictiones* were now no longer levied sporadically, when and where required, but became universal and regular. To provide a basis for them, censuses of the land and the agricultural population were held throughout the empire. Land was assessed, according to its use and quality,

in fiscal units (*juga*) of equal value, and the population (and also animals) in units styled *capita*. Each year the praetorian prefects drew up a budget of all the goods required, and worked out the amount due from each *jugum* or *caput*.

For the greater part of his reign Diocletian continued the policy of tacit toleration of the Christians which his predecessors had followed since Gallienus. Toward the end of his reign, probably under the influence of his Caesar Galerius, he instituted a severe persecution, which began on Feb. 23, 303.

On May 1, 305, Diocletian abdicated, and on the same day Maximian did the same in the west. The two Caesars were proclaimed Augusti and two new Caesars were appointed, Severus for the west and Maximinus for the east. Diocletian no doubt hoped that he had solved the problem of the succession, but things did not work out according to plan. Constantius, the western Augustus, died at York, and on July 25, 306, his troops proclaimed his son Constantine his successor as Augustus. Later in the same year Maxentius, the son of Maximian, headed a revolt at Rome against Severus, whom Galerius had declared Constantius' successor, and Maximian himself resumed the purple in his son's support. Severus was defeated and killed, and Galerius himself was forced to withdraw when he invaded Italy. In 308 Galerius called Diocletian and Maximian to a conference at Carnuntum. Maximian was persuaded to resign once more, and Licinius was proclaimed Augustus of the west; Constantine and Maximinus were recognized as Caesars. Both, however, insisted on the title of Augustus, and Maxentius remained unsubdued in Italy. There were therefore now six Augusti.

In 311 Galerius died, and Licinius occupied his European provinces, Maximinus Asia Minor. Next year Constantine conquered Maxentius, thus becoming Augustus of all the west. In 313 Maximinus attacked Licinius, who defeated him and thus became Augustus of all the east. Galerius and Maximinus had been active persecutors of the Christians. Constantine, believing that he owed his victory over Maxentius to the aid of the Christian god, whose monogram (☧) he had inscribed on his soldiers' shields at the decisive Battle of the Milvian Bridge, became a Christian and granted money and privileges to the church. Under his persuasion Licinius proclaimed toleration in his dominions. Constantine soon quarreled with Licinius and in 314–315 conquered from him the dioceses of Pannonia and Moesia. The final struggle came ten years later. Licinius began to persecute the Christians, and Constantine in 324 decisively defeated him, thus becoming sole Augustus.

To celebrate his victory he rebuilt Byzantium on a magnificent scale and renamed it Constantinople. Constantinople was from the first a Christian city, furnished with many churches. It became Constantine's normal residence and was perhaps from the beginning styled the New Rome, though it lacked Rome's constitutional prerogatives.

Constantine made a major military reform in greatly increasing the size of the field army (*comitatenses*) and reducing the frontier army (*limitanei*) to a secondary role. The field army was led by commanders in chief of the cavalry and the infantry (*magister equitum* and *peditum*), and the frontier troops by zone commanders (*duces*). The praetorian prefects, vicars, and provincial governors thus lost all military power. Constantine also initiated a sound gold and silver currency; his gold coin, the *solidus*, maintained its weight and purity into the Middle Ages. He obtained the necessary bullion partly by a tax in gold and silver levied on merchants and craftsmen but mainly by the confiscation of the temple treasures in 331.

Constantine considered it his duty to heal dissensions in the church, which he feared might provoke God's wrath against the empire and more particularly against himself, to whom God had entrusted its government. Immediately after his conversion he was faced with the Donatist controversy in Africa, and on his conquest of the east with the Arian controversy (*see* DONATISTS; ARIUS). To settle the former he summoned councils of bishops at Rome and at Arles, and finally confirmed their judgment himself. To solve the latter he convoked in 325 an ecumenical council at Nicaea, at which he himself presided (*see* COUNCIL), and another great council at Jerusalem in 335. He executed the decrees of these councils, persecuting those whom they condemned as heretics. He built many magnificent churches, notably at Rome, Constantinople, Antioch, and Jerusalem, and granted many legal and fiscal privileges to the churches and the clergy. Paganism he at first tolerated, but in 331 he confiscated the treasures and lands of the temples, and he seems to have banned sacrifices in the last years of his reign.

ALINARI

OVERSIZED HEAD OF CONSTANTINE ADORNING A FAÇADE IN ROME. BELOW, AN ALLEGORICAL STATUE REPRESENTING ONE PROVINCE OF THE EMPIRE

The reigns of Diocletian and Constantine gave the empire a new lease of life, but the vast increase of the army and civil service placed a heavy strain on the manpower of the empire, already depleted by the wars, famines, and plagues of the 3rd century. The maintenance of the larger army and civil service, the great program of public works—frontier fortresses, arms and clothing factories, churches, and Constantinople—and Constantine's lavish benefactions to the church placed an even heavier strain on its resources. Manpower shortages developed, and the rate of taxation on agriculture rose so high that marginal land began to fall out of cultivation, while the decurions of the cities, on whom lay the collection of the taxes, found their task increasingly difficult. The response of the government to these difficulties was to attempt to tie to their tasks various classes whose functions were vital to the empire's needs, and to extend this tie to their children; since most classes were in practice hereditary, this was a natural solution. Sons of soldiers and veterans were obliged to join the army, sons of civil servants to enter their father's office. Decurions were forbidden to resign from the councils of their cities, and their sons, who inherited their property, had to accept membership. Above all, in order to make sure that the poll tax was paid and that the land was cultivated and furnished the requisite foodstuffs for the indiction, the agricultural population was hereditarily bound to the places where it was registered in the census. Similar rules applied to miners and to the shippers who transported government cargoes. These rules were difficult to enforce and were frequently disobeyed and evaded. Ambitious

men could always escape from their hereditary status, and many men of humble origin rose to high positions in the state service. But the government did achieve its object, to maintain an army adequate to repel increasing barbarian pressure.

Constantine's conversion had momentous consequences for the future of the church and of Christianity. From being a poor society, living under precarious toleration, the church became a wealthy and privileged body. Christianity, which had been confined to a small minority of mainly humble folk, on gaining official favour attracted many converts, especially from the upper classes; numbers grew, if the quality of the recruits declined. At the same time the church acquired a master, for Constantine, being convinced that he was God's servant, did not hesitate to intervene in ecclesiastical affairs.

2. The Reorganized Empire.—Diocletian approximately doubled the number of provinces, dividing some into five or six; he also partitioned Italy into provinces. The provinces were grouped in 12 large circumscriptions called dioceses, in each of which a deputy of the praetorian prefects (*vicarius*) supervised the governors and served as a link between them and the central government. In each diocese there were also representatives of the two finance ministries (*magistri rei privatae* and *rationales rei summae*). Completing a process which had begun in the 3rd century, Diocletian almost eliminated senators from the provincial administration; Asia and Africa still had their proconsuls, the Italian provinces (and Sicily and Achaea) were governed by *correctores*, who might be senators, all the rest by equestrian *praesides*. The governor was now responsible for all branches of administration, except in the provinces where the military command was held by a *dux*. Constantine completed the separation of civil administration and military command, and from his reign they were combined only in Isauria. He also admitted senators to provincial government on a larger scale, substituting senatorial *consulares* for equestrian *praesides* in a number of provinces.

Each governor was assisted by a judicial assessor, usually a barrister, of his own choice, and was served by a staff (*officium*) of about one hundred clerks and messengers. His main duties were to collect the revenue and administer justice. The average term of office was short, about a year, and the standard of official morality was low, extortion and corruption being widespread. This was partly because governorships were much sought after and were often virtually purchased by large bribes to the emperor's chief ministers and advisers, and those appointed were forced to supplement their official salaries by illicit means to recoup themselves.

(A. H. M. J.)

3. The Empire, A.D. 337–476.—For the internal politics of the period and the various usurpations *see* the articles on the individual emperors. The financial and military reforms of Diocletian and Constantine proved to be of permanent value, and the state as organized by them was little altered by their successors. The administration of the empire, too, as refashioned by Diocletian and Constantine, continued to function and develop throughout the rest of the period of the later empire.

Emperors.—After the death of Theodosius I in 395 the empire was never again ruled for any significant length of time by a single emperor. From 395 to 480 it was ruled by two or more colleagues, one in the east and one or more in the west, all with equal rights. When an emperor had sons he usually appointed his eldest son as co-Augustus, as Valentinian and Theodosius appointed respectively Gratian and Arcadius. This son was expected to become his successor, and normally he did in fact succeed. But if the emperor had no son, then the army appointed his successor (as was done, *e.g.*, on the death of Julian), and the appointment was then announced to the Senate. In the 5th century the duty of crowning the eastern emperor was given to the patriarch of Constantinople.

In theory, and in many ways in practice too, the empire remained a single unit even when ruled by a plurality of emperors; and, although it is convenient sometimes to refer to the "Western Empire" and the "Eastern Empire," this must not be taken to imply that there were two empires. Laws were published over the names of all the legitimate emperors; when the ruler of one part of the empire died, his power automatically passed to his surviving colleague until a successor was appointed; and each emperor named one of the two consuls for each year.

Senates.—As for the Senate, Constantius II elevated the Senate of Constantinople to an equal level with that at Rome, so that there were henceforth two Senates in the empire other than the local, municipal senates. Membership was hereditary; and the sons of senators entered the Senate when they had held the quaestorship or, after the end of the 4th century, the praetorship. Senators were divided into three classes, the *illustres*, the *spectabiles*, and the *clarissimi*. The most important offices in the state gave their holders one or other of these ranks and so brought them entry to the Senate. Moreover, the late emperors showed much generosity in conferring the rank of *clarissimus* on favoured individuals. It has been calculated, in fact, that in the 5th century there were about 2,000 senators in the western empire; the number in the east may have been smaller. The wealth of these senators was derived from the landed estates they owned, and in some cases it reached fantastic dimensions. An early 5th-century historian cites some western senators as having an annual income of 1,000 or 1,500 or even 4,000 lb. of gold, together with an income in kind of one-third of these amounts. Symmachus (*q.v.*) spent 2,000 lb. of gold on the occasion of his son's holding the praetorship. The younger St. Melania, the daughter and grandaughter of senators, owned estates in Gaul, Italy, Spain, Sicily, Africa, and possibly in other provinces, too. When she died *c.* 440 she manumitted in her will 8,000 slaves. It was not unusual for the estates of wealthier senators to be distributed thus through several provinces; the loss of any one province to the barbarians thus would not necessarily bankrupt them. The growth of the large senatorial estates, however, had advanced much farther in the west than in the east, and it would appear that these vast fortunes, common enough in the west, were distinctly rare by comparison in the east.

Local Government.—The members of the local town councils, the *curiales* or decurions, as they were called, were the object of close attention on the part of the emperors. In addition to the ordinary duties of local government, they were in this period responsible for the collection of the land tax in the locality in which they lived. If there was any deficiency in the amount due to the central government, the curials were collectively obliged to make it up out of their own pockets. As the empire declined, their position became desperate; their efforts to escape from their obligations by joining the army, the civil service, the church, etc., were so continuous that in 336 Constantine had made the curial office hereditary. No fewer than 192 laws had been enacted regulating the position of the curials by the time Theodosius II published his law code in 438. Valentinian I established a new office, that of the *defensor* in the municipal towns, in an attempt to protect the poor from oppression. The *defensores* were not successful, even when Theodosius I transferred the duty of appointing them from the praetorian prefect to the curials. Local government offices, which in the early empire had been posts of honour, were in this period heavy and sometimes intolerable burdens to those who held them.

Economy.—The principle of compelling sons to follow their fathers' careers was also enforced by the government in the case of certain trades and professions, particularly those responsible for ensuring the food supply of Rome and Constantinople—the shippers who transported the grain from Africa and Egypt, and the bakers who made this grain into bread. But during the 4th century the members of all trade guilds were tied to their jobs by law; and in the state factories the workers were actually branded, to make recapture easy if they should flee from their occupations. The economy of the later empire was essentially one of private enterprise, for most industrial and commercial property was still privately owned. But this private enterprise was controlled by the state with a rigour for which it would be difficult to find a parallel in any other period of history.

It would be a mistake to suppose that all the agricultural land outside the walls of the cities was given over to the great estates of the senators and the emperors and to the smaller estates of the curials. There were also many small farms belonging to free

peasant proprietors, to humble city dwellers, and to peasants who leased them in a great variety of ways. Nor were all landworkers *coloni* (peasants bound to the soil) or slaves. The labourers in the fields were now, it is thought, less often slaves than they had been in the earliest days of the empire. But agricultural slavery certainly existed still, and, even though the cessation of the great wars of aggression had reduced the intake of slaves, a slave trade still flourished on the frontiers of the empire, where slaves were apt to be cheaper than they were in the interior. But the characteristic form of labour, at any rate on the large estates, was the *colonus,* first mentioned in a law of 332 and referred to in a law of 364 as being hereditarily bound to the soil.

There was a severe shortage of agricultural labour in the later empire, and indeed very large areas of land were left uncultivated because there was no one available to cultivate them. The practice of tying peasants to the soil seems to have had a fiscal origin; but landlords found it useful, for tenants were hard to find and, once found, they could now be prevented from moving on to places where they might hope to better themselves. Dozens of laws were enacted relating to the restoration of fugitive *coloni* to their masters. Even so, the tying of the *colonus* to the land was not carried through in all parts of the empire simultaneously; it was introduced into Palestine, for example, only during the reign of Theodosius I and it does not appear at all in Egypt until the 5th century.

The condition of the agricultural workers was in general very harsh, and in Gaul and Spain extensive and prolonged revolts broke out, particularly in the 5th century. Even in 284–285 there had been a rebellion in Gaul of the "rustics," who had given themselves the name of *Bagaudae.* This name is used frequently by 5th-century authors to denote the rebellious peasants of Spain, the French Alps, and particularly Armorica (approximately Brittany), this last place being the main centre of revolt. But shortly after the middle of the 5th century these rebellions died down and are not heard of later in the west, though they continued in the Danubian provinces. While the *Bagaudae* continued to operate, many farm workers fled to join them from parts of Gaul which were not directly the scene of revolt. Many others fled in the 5th century to the Visigothic kingdom in the southwest of the country, where they found the conditions of life less harsh than in the Roman provinces. Others, too (particularly in the provinces south of the lower Danube), when a barbarian raid took place, were likely either to join the barbarians or to take advantage of the confusion caused by the raid to flee from the occupations to which the law bound them.

Barbarian Invasions.—The barbarian invasions were among the most momentous phenomena of the later empire. The eastern frontier was seriously disturbed until the year 363 when, following on the failure of Julian's great expedition into the Persian Empire, Jovian made a disgraceful peace with the Persians, surrendering to them much Roman territory and some Roman cities of great strategical importance. But thereafter the eastern frontier of the Roman Empire was comparatively peaceful, as the Persians were fully occupied by the attacks of the Hephthalite Huns on their northern frontier. The raids of the Saracens, the tribes of the upper Nile Valley, and the Moors were of minor importance.

On the other hand, the European provinces of the Roman Empire were subjected not only to innumerable small raids and plundering forays by land and sea but also to three major waves of attack by the Germanic peoples of the north. The first of these major assaults came in 376, when the Visigoths, fleeing before the Huns, were permitted to cross the lower Danube. After their victory at Adrianople (378), where they killed the emperor Valens, they settled in Moesia in 382 as federates (allies under a treaty, *foedus,* to defend the frontiers). But in 395 they left Moesia and wandered westward. In 410 they captured Rome itself and in 418 they were again settled by the Roman authorities as federates, this time on the western seaboard of France between the mouths of the Garonne and the Loire. In 443 the Burgundians were settled by Aetius as federates in Savoy, and in 456 they extended their power over most of the Rhône Valley. In the middle of the 5th century, then, the greater part of Gaul south of the Loire was occupied by Visigothic and Burgundian federates.

The second great intrusion of barbarians began on Dec. 31, 406, when the Vandals, the Suebi (Sueves), and the non-Germanic Alani crossed the middle Rhine, ravaged Gaul for three years, and then settled in Spain from 409 to 429. In the latter year those of the Vandals and Alani who still survived crossed into Africa and in 435 were recognized as federates by the government at Ravenna. But in 439, after they had captured Carthage, they became an independent state, the first free German state to be set up in the Mediterranean area of the Roman Empire. The second such state was that of the Visigoths in southwestern Gaul, for their king Euric threw off the overlordship of the Roman government in 475.

The last of the major barbarian invasions followed on the collapse of the empire of Attila (*q.v.*) and his sons in 455. Several Germanic peoples now made for the Roman frontier, and being hungry and landless begged to be admitted to the provinces as federates. The Ostrogoths were thereupon settled by the eastern Romans in Pannonia, and other less important peoples elsewhere. Fragments of several peoples also descended into Italy, where in 476 they deposed Romulus Augustulus and established Odoacer (*q.v.*) as their king. These peoples, too, were recognized as federates, and Odoacer, though in effect king of Italy, admitted the overlordship of the eastern Roman emperor. (*See* also separate articles on the various barbarian peoples.)

The position, then, in 476 was that North Africa and southwestern Gaul were in the hands of German kings who were politically independent of the Romans. Southeastern Gaul and Italy were ruled by German kings who acknowledged themselves subjects of the emperor at Constantinople. The position in northern Gaul is exceedingly obscure, for sources of information about that region can scarcely be said to exist. Little is known of Spain; much of it was presumably still in Roman hands, but the northwest of the peninsula was occupied by the Suebi, who had entered Spain with the Vandals and Alani in 409. They may have been independent. The provinces along the upper Danube were under heavy pressure from the barbarians, especially the Alamanni. Britain had stood outside these movements, and it was still controlled by the Roman administration in 409. But in that year the emperor Honorius wrote to the cities in the island bidding them look to their own defense against the barbarians. Italy, in that and the following year, was invaded by Alaric (*q.v.*), and no troops could be spared for the defense of the island. For many years thereafter nothing is heard of Britain; but there is no evidence that the Romans formally "withdrew" from the island, and presumably the Roman administration continued to function, at any rate in some parts of the country, for some time. But by 476 Roman rule had long since passed away.

In all the German states of the continent, both those of the federates and those which were independent, life continued as it did in the provinces which were still directly ruled by the emperors of the east and of the west. A somewhat exceptional case was Africa, where the Vandals expropriated many of the large Roman estates and continued to exploit them with the existing labour force and with the existing agricultural methods. The Roman population continued to be subject to Roman law in all the kingdoms alike; and this law continued to be administered by a Roman civil service, which also collected the taxes and which even in the independent states was recruited from Romans. The essential difference was that the armed forces were now composed of Germans only, and Romans were excluded from military service.

Except in Africa tension between the Germans and the Romans was slight; but it certainly existed, and the two peoples were everywhere divided by religion, the Romans being Catholics and the Germans remaining Arians everywhere throughout this period. Intermarriage between Romans and barbarians had been made a capital offense by Valentinian I, and his law remained in force both in the empire and in the kingdoms, though a few cases are known where it was broken with impunity.

The numbers of the Germans who settled in the provinces cannot be calculated even approximately; it is known that the Vandals who crossed from Spain to Africa in 429 numbered 80,000. It cannot

reasonably be doubted, however, that the new settlers amounted to no more than a small percentage of the population as a whole. In all, it can scarcely be said that the 5th century marked a decisive break in the history of continental Europe or Africa in any sense except a political one. Roman laws, institutions, literature, and even the Roman administrative machine continued to flourish throughout the west. In Britain, on the other hand, the years following 409 formed a break which was both decisive and complete.

(E. A. T.)

BIBLIOGRAPHY.—*Sources: Republican Period:* The formation of Roman historiography and the sources for Roman history before 264 B.C. are described above; the material which the sources provide for the subsequent history of Rome is essentially more reliable. The early annalists, such as L. Calpurnius Piso Frugi (consul in 133 B.C.), were well informed about contemporary events, whatever their knowledge of Rome's earlier history. The collection and publication (*c.* 123 B.C.) of the *Annales Maximi* in 80 books by Mucius Scaevola made much early material available in a definitive form which was used by later annalists. At the same time the Greek statesman Polybius wrote an accurate "universal" history because he saw that Rome's conquest of the Mediterranean world made such treatment possible for the first time. Whereas only a few fragments survive of most of the early writers, there are large portions of Polybius' work, which started with the First Punic War. His work was continued by Poseidonius. During this period monographs (as that of Coelius Antipater on the Hannibalic War) and autobiographies (as those by Aemilius Scaurus, Rutilius Rufus, and later Sulla) appeared. In the Sullan age the annalistic tradition was carried on by diffuse and rhetorical writers such as Claudius Quadrigarius and Valerius Antias (both of whom were used by Livy). Sempronius Asellio wrote a history (*res gestae*), not in annalistic form (*annales*), probably from 146 to 91 B.C., where the story was taken up by Sisenna who probably took it down to 78, where Sallust's *Historiae* started; Sallust also wrote two valuable monographs. The excellent *Commentaries* of Julius Caesar and the exceedingly important correspondence of Cicero, as well as many of his speeches, survive. In the Ciceronian period much valuable antiquarian work was done by such men as Varro, Pomponius Atticus, and others which aided later writers to correct the mistakes of their predecessors.

In the Augustan age the materials accumulated by previous generations were worked up by compilers whose works are in some cases preserved. The work by Livy covered the history of Rome from its foundation to 9 B.C. in 142 books; of these only 35 are preserved in their entirety, while the contents of the rest are known in outline from an epitome (*periochae*) and from the compendia of Florus and later authors. Diodorus Siculus followed the earlier annalists in the sections of his *Universal History* (down to Caesar) which dealt with Roman affairs; Dionysius of Halicarnassus, in his *Roman Antiquities* (7 B.C.), treated early Roman history in a more ambitious and rhetorical style, with greater fullness than Livy, whose work he seems to have used. Universal histories were also written in the Augustan age by Pompeius Trogus, whose work is known from the epitome of Justin (2nd century A.D.), and Juba, the learned king of Mauretania. Strabo, whose *Geography* is extant, was the author of a continuation of Polybius' history (to 27 B.C.). The learning of the time was enshrined in the encyclopaedia of Verrius Flaccus, of which part of Festus' abridgment (2nd century A.D.) remains, together with an epitome of Festus by Paulus Diaconus (of the time of Charlemagne). An official list of the consuls and other chief magistrates of the republic was inscribed on the arch of Augustus in the Forum, together with a similar list of *triumphatores;* the former of these is known as the *Fasti Capitolini* (A. Degrassi, *Inscriptions Italiae,* xiii, 1 [1947]), since the fragments which have been recovered are preserved in the Palace of the Conservatori on the Capitol.

Among writers of the imperial period who dealt with republican history the most important are Velleius Paterculus, whose compendium of Roman history was published in A.D. 30; Plutarch (*c.* A.D. 45–125), in whose biographies much contemporary material was worked up; Appian, who wrote under the Antonines and described the wars of the republic under geographical headings (partly preserved) and the civil wars in five books; and Dio Cassius (*see* below), of whose history only that portion which deals with events from 69 B.C. onward is extant.

The evidence of inscriptions and coins begins to be of value during the last 150 years of the republic. A series of laws and *senatus consulta* (beginning with the *senatus consultum de Bacchanalibus,* 186 B.C.) throws light on constitutional questions, while many of the coins struck from about 150 B.C. onward bear types illustrative of the traditions preserved by the families to which the masters of the mint (*triumviri monetales*) belonged.

Sources: Imperial Period: The memoirs of Augustus as well as those of his contemporaries (Messalla, Agrippa, Maecenas, etc.) and successors (Tiberius, Agrippina the younger, etc.) have perished, but the *Res gestae divi Augusti* inscribed on the walls of his temple at Ancyra survive, together with fragments of copies at Apollonia and Antioch, both in Pisidia (ed. by T. Mommsen [1883] and J. Gagé, 2nd ed. [1950]). Aufidius Bassus wrote the history of the civil wars and early empire, perhaps to A.D. 49, and this was continued by Pliny the elder in 31 books, probably to the accession of Vespasian. These works and others were used by Cornelius Tacitus, whose *Annals* (properly called *ab excessu divi Augusti*) and *Histories* carried the story of the empire down to A.D. 96. Pliny's correspondence with Trajan about the affairs of Bithynia, which he administered in A.D. 111–113, is of great historical value. Suetonius, who was for some time secretary of state to Hadrian, wrote biographies of the emperors from Julius Caesar to Domitian. Arrian, a Bithynian Greek, wrote on Rome's policy and wars in the east. Appian dealt with the wars waged under the early empire in the closing books of his work, which have not been preserved.

Dio Cassius wrote a history of Rome to the death of Elagabalus in 80 books; only epitomes and excerpts remain of the portion dealing with events from A.D. 46 onward, except for parts of the 78th and 79th books, in which Dio's narrative of contemporary events is especially valuable. Herodian, a Syrian, wrote a history of the emperors from Commodus to Gordian III, which as the work of a contemporary is not without value. The *Historia Augusta,* upon which it is necessary to rely for the history of the 3rd century A.D., consists of a series of lives of the emperors (including most of the pretenders to that title) from Hadrian to Carinus, professedly written by six authors, under Diocletian and Constantine. It is now generally believed that (at least in its present form) it is a compilation of mixed value made perhaps in the latter half of the 4th century. The fragments of Dexippus, an Athenian who successfully defended his native town against the Goths, throw much light on the barbarian invasions of the 3rd century.

The most important historian of the 4th century was Ammianus Marcellinus, a native of Antioch and an officer in the imperial guard, who continued the work of Tacitus (in Latin) to the death of Valens; the last 18 books of his history, covering the years A.D. 353–378, remain. Two compendia of imperial history pass under the name of Aurelius Victor, the *Caesares,* or lives of the emperors from Augustus to Julian, and the *Epitome de Caesaribus* (not by the same author) which goes down to Theodosius I. Similar works are the *Breviarium* of Eutropius (secretary of state under Valens) and the still briefer epitome of Festus. The writings of the emperor Julian and of the rhetoricians Libanius, Themistius, and Eunapius—the last-named continued the history of Dexippus to A.D. 404—are of great value for the latter part of the 4th century A.D. They wrote as pagans, while the Christian version of events is given by the three orthodox historians, Socrates, Sozomen, and Theodoret, and the Arian Philostorgius, all of whom wrote in the 5th century. An imperial official, Zosimus, writing in the latter half of that century, gave a sketch of imperial history to A.D. 410; the latter part is valuable, being based on contemporary writings. The bishops Synesius and Palladius, who lived under Arcadius and Theodosius II, furnish valuable information as to their own times; while the fragments of Priscus tell much of Attila and the invasions of the Huns.

Mention must also be made of the poets and letter writers of the 4th and 5th centuries—Ausonius, Claudian, Symmachus, Paulinus of Nola, Sidonius Apollinaris, Prudentius, Merobaudes, and others—from whose writings much historical information is derived. Cassiodorus, the minister of Theodoric, wrote a history of the Goths, transmitted in the *Historia Gothorum* of Jordanes (*c.* A.D. 550), which gives an account of the earlier barbarian invasions. Several chronological works were compiled in the 4th and 5th centuries. It will suffice to name the *Chronology* of Eusebius (to A.D. 324), translated by Jerome and carried down to A.D. 378, and the *Chronography of A.D. 354,* an illustrated calendar containing miscellaneous information.

The codes of law, especially the *Codex Theodosianus* (A.D. 438) and the code of Justinian, as well as the army list of the early 5th century, known as the *Notitia Dignitatum,* possess great historical value. Inscriptions of the empire are of incalculable importance as showing the working of the imperial system in its details; the coins also throw much light on the dark places of history in the lack of other authorities. Papyri are not only instructive as to legal, economic, and administrative history but also contribute to general knowledge of events. *See* especially L. Mitteis and U. Wilcken, *Grundzüge und Chrestomathie der Papyruskunde,* 4 vol. (1912), and bibliography in M. Rostovtzeff, *Social and Economic History of the Roman Empire,* 2nd ed. (1957). *The Journal of Egyptian Archaeology* gives an annual bibliography of this subject.

Modern Works: General Histories: The Cambridge Ancient History, ed. by S. A. Cook, F. E. Adcock, M. P. Charlesworth, and (vol. xii) N. H. Baynes; vol. vii–xii (1928–39) cover the history of Rome to A.D. 324; M. Cary (ed.), *Methuen's History of the Greek and Roman World,* vol. iv, *A History of the Roman World from 753 to 146 B.C.,* by H. H. Scullard (3rd ed., 1962), vol. v, *146–30 B.C.,* by F. B. Marsh (3rd ed., 1963), vol. vi, *30 B.C.–A.D. 138,* by E. T. Salmon (4th ed., 1963), vol. vii, *A.D. 138–337,* by H. M. D. Parker (2nd ed., 1958); M. Cary, *A History of Rome down to the Reign of Constantine* (2nd ed., 1954) is the best one-volume history; M. Rostovtzeff, *A History of the Ancient World,* vol. ii, *Rome* (1927); A. E. R. Boak, *A History of Rome to 565 A.D.,* 5th ed. (1964); G. Glotz (ed.), *Histoire ancienne,* part iii, *Histoire romaine,* 4 vol. (1926–47); A. Piganiol, *Histoire de Rome,* 3rd ed. (1949); L. Pareti, *Storia di Roma,* 6 vol. (1952–61); A. Heuss, *Römische Geschichte* (1960).

Modern Works: Early Rome and Italy: J. Whatmough, *The Foundations of Roman Italy* (1937); E. Gjerstad, *Early Rome,* vol. i–iii

(1953–60; three more volumes in preparation), collects the archaeological evidence; recent literature and theories are discussed by A. Momigliano in *Journal of Roman Studies,* vol. liii, pp. 95–121 (1963); P. de Francisci, *Primordia Civitatis* (1959); R. Bloch, *The Origins of Rome* (1960).

Modern Works: The Republic: T. Mommsen, *The History of Rome,* Eng. trans. by W. P. Dickens, rev. ed., 5 vol. (1908–13); W. E. Heitland, *The Roman Republic,* 3 vol. (1909); T. Frank, *Roman Imperialism* (1914). The most authoritative work (down to 133 B.C.) is G. De Sanctis, *Storia dei Romani,* vol. i–iv (1907–64). *See* also K. J. Beloch, *Römische Geschichte bis zum Beginn der punischen Kriege* (1926); F. Münzer, *Römische Adelsparteien und Adelsfamilien* (1920); M. Holleaux, *Rome, la Grèce et les monarchies hellénistiques au III^e siècle avant J.-C. (273–205)* (1921); G. Colin, *Rome et la Grèce de 200 à 146 avant Jésus-Christ* (1905); H. H. Scullard, *Roman Politics, 220–150 B.C.* (1951); E. Badian, *Foreign Clientelae (264–70 B.C.)* (1958); A. H. J. Greenidge, *A History of Rome, B.C. 133–104* (1904); A. H. J. Greenidge and A. M. Clay, *Sources for Roman History, 133–70 B.C.,* 2nd ed. by E. W. Gray (1960); T. Rice Holmes, *The Roman Republic,* 3 vol. (1923), deals with 70–44 B.C.; H. H. Scullard, *From the Gracchi to Nero,* 2nd ed. (1963), covers late republic and early empire. For the period of transition from republic to empire, *see* especially F. B. Marsh, *The Founding of the Roman Empire,* 2nd ed. (1927); Sir Ronald Syme, *The Roman Revolution* (1939); T. Rice Holmes, *The Architect of the Roman Empire,* 2 vol. (1928–31). M. Gelzer, *Die Nobilität der römischen Republik* (1912; reprinted in *Kleine Schriften,* vol. i, 17 ff. [1962]), interpreted the nature of Roman politics and society as a nexus of personal relations and obligations. The prosopographical approach was developed further by F. Münzer, while P. Fraccaro (*see Opuscula,* 3 vol. [1956–57]), following in the tradition of Mommsen, illuminated many aspects of republican politics and constitutional practice.

Modern Works: The Empire: Two introductory books are M. P. Charlesworth, *The Roman Empire* (1951); A. Passerini, *Linee di storia romana in eta imperiale* (1949). *See* also H. Dessau, *Geschichte der römischen Kaiserzeit,* 3 vol. (1924–30); E. Gibbon, *The Decline and Fall of the Roman Empire,* ed. J. B. Bury, 7 vol. (1896–1900); E. Stein, *Histoire du Bas-Empire,* ed. J.-R. Palanque, 2 vol. (1959, 1949); A. H. M. Jones, *The Later Roman Empire, 284–602,* 3 vol. (1964); J. B. Bury, *History of the Later Roman Empire (A.D. 395 to A.D. 565),* 2 vol. (1923), *The Invasion of Europe by the Barbarians* (1928); F. Lot, *The End of the Ancient World, and the Beginnings of the Middle Ages* (1931); O. Seeck, *Geschichte des Untergangs der antiken Welt,* 6 vol. (1895–1921); H. M. Gwatkin and J. P. Whitney (eds.), *The Cambridge Medieval History,* vol. i and ii (1911–13). For the provinces, *see* T. Mommsen, *The Provinces of the Roman Empire from Caesar to Diocletian,* 2 vol., Eng. trans. (reprinted 1909); V. Chapot, *The Roman World* (1928); J. S. Reid, *The Municipalities of the Roman Empire* (1913); F. F. Abbott and A. C. Johnson, *Municipal Administration in the Roman Empire* (1926); A. H. M. Jones, *The Cities of the Eastern Roman Provinces* (1937), *The Greek City from Alexander to Justinian* (1940); G. H. Stevenson, *Roman Provincial Administration till the Age of the Antonines* (1939).

Modern Works: Constitutional: T. Mommsen, *Römisches Staatsrecht,* 3 vol. (1881–87), and *Römisches Strafrecht* (1889), are still fundamental; A. H. J. Greenidge, *Roman Public Life* (1901); L. Homo, *Roman Political Institutions from City to State,* Eng. trans. (1929); E. Meyer, *Römischer Staat und Staatsgedanke,* 2nd ed. (1961); G. W. Botsford, *The Roman Assemblies* (1909); L. R. Taylor, *The Voting Districts of the Roman Republic* (1960); A. N. Sherwin-White, *The Roman Citizenship* (1939); T. R. S. Broughton and M. L. Patterson, *The Magistrates of the Roman Republic,* 2 vol. and supplement (1951–60); A. Degrassi, *I Fasti consolari dell'Impero Romano* (1952); M. Hammond, *The Augustan Principate* (1933), *The Antonine Monarchy* (1959); F. de Martino, *Storia della costituzione romana,* 4 vol. (1958–62).

Modern Works: Economic and Social: T. Frank (ed.), *An Economic Survey of Ancient Rome,* 5 vol. (1933–40), covers Italy and the provinces. *See* also T. Frank, *An Economic History of Rome,* 2nd ed. (1927); M. Rostovtzeff, *The Social and Economic History of the Roman Empire,* 2nd ed., 2 vol. (1957); M. P. Charlesworth, *Trade-Routes and Commerce of the Roman Empire,* 2nd ed. (1926); Sir John Clapham *et al.* (eds.), *The Cambridge Economic History of Europe,* vol. i and ii (1941–52); M. Grant, *The World of Rome* (1960); W. Warde Fowler, *Social Life at Rome in the Age of Cicero* (1915); J. Carcopino, *Daily Life in Ancient Rome . . . at the Height of the Empire,* Eng. trans. by E. O. Lorimer (1940); S. Dill, *Roman Society from Nero to Marcus Aurelius,* 2nd ed. (1905), and *Roman Society in the Last Century of the Western Empire,* 2nd ed. (1899); A. Modern Works: Military: J. Kromayer and G. Veith, *Heerwesen und Kriegführung der Griechen und Römer* (1928), *Antike Schlachtfelder,* 4 vol. (1903–31), *Schlachtenatlas zur antiken Kriegsgeschichte* (1922–26); H. M. D. Parker, *The Roman Legions,* 2nd ed. (1958); P. Couissin, *Les Armes romaines* (1926); C. G. Starr, *The Roman Imperial Navy,* 2nd ed. (1961). (H. H. Sd.)

ROMANIA, a name used by the Byzantines to describe the territory under their control, and, more particularly, by the Western powers to describe the Latin empire of Constantinople (1204–61). The name is derived from "Rome," the Byzantine Empire being the successor to the Roman Empire (*see* also RUM [Roum]). Romania is also a variant for Rumania (*q.v.*).

ROMAN LAW. The term "Roman law" denotes first of all the law of the city of Rome and of the Roman Empire: in the West, the law in force at any period from the foundation of the city (traditional date 753 B.C.) until the fall of the Western empire in the 5th century A.D.; and in the East, the law of the Eastern empire, until it too fell with the capture of Constantinople by the Turks in 1453. The law even of the later Eastern empire remained wholly Roman in character.

But "Roman law" does not mean merely the law of those political societies to which the name Roman may in some sense be applied; for the legal institutions evolved by the Romans have had not merely influence on the law of other peoples but in many cases actual application, in times long after the disappearance of the Roman Empire as a political entity and even in countries that were never subject to Roman rule. To take the most striking example, in a large part of Germany until the adoption of a common code for the whole empire in 1900 the Roman law was in force as "subsidiary law"; *i.e.,* it was applied unless excluded by contrary local provisions. This law, however, which was in force in parts of Europe long after the fall of the Roman Empire, was not the Roman law in its original form. Its basis was indeed always the *Corpus juris civilis—i.e.,* the codifying legislation of the emperor Justinian I (*see* below)—but from the 11th century this legislation was interpreted, developed, and adapted to later conditions by generations of jurists and received additions from non-Roman sources. All the forms it assumed in different countries and at different epochs can be included under "Roman law." In England the term "civil law" often denotes Roman accessions, in contrast to native "common law."

Roman law is important not only as the system once in force in many places but also as an influence on the development of law in general. Even today, the legal systems of Western civilization (with some exceptions, especially the Scandinavian) fall into two groups, in one of which the main elements are of Roman origin; the other is English. To the English group belong England, nearly all the United States of America, and most British territories; to the Roman group belong the rest. Nearly all the nations of continental Europe have legal codes that are Roman in structure, fundamental categories, and general method of thought. Within the British territories, Scotland has a system largely derived from the Roman; Quebec has a system of French law built largely with Roman materials; and Ceylon has a system known as "Roman-Dutch," based on Roman law as developed by Dutch jurists. English law itself, though owing less to Roman law than does any other system, has at different times and in different ways received considerable accessions from Roman sources (*see* ENGLISH LAW).

This article is confined to the history of private law within the Empire up to the death of Justinian. It is outlined as follows:

I. Historical Conspectus
  1. Mid-Republican Period (450–150 B.C.)
  2. Late Republican Period
  3. Early Empire and Classical Period
  4. Postclassical Period
II. Sources of the Law
  A. Jus Non Scriptum or Custom
  B. Jus Scriptum
    1. Leges and Plebiscita
    2. Senatus Consulta
    3. Edicta Magistratuum
    4. Responsa Prudentium
    5. Constitutiones Principum
    6. Earlier Collections of Constitutions
  C. The Law of Justinian
    1. Codex Constitutionum
    2. Digest (Pandects)
    3. Institutes
    4. Revised Codex
    5. Novels
    6. Corpus Juris Civilis

III. The Law of Persons
A. Slavery
B. Citizenship
C. Family
1. Patria Potestas
2. Marriage
3. Guardianship
D. Corporations
IV. The Law of Property and Possession
A. Methods of the Jus Civile
1. Mancipatio
2. In Jure Cessio
3. Usucapio
B. Methods of the Jus Gentium
1. Occupatio
2. Accessio
3. Specificatio
4. Thesauri Inventio
5. Traditio
C. Forms of Property in Land Other than Ownership
1. Servitudes
2. Possession
D. Obligations
1. Delict
2. Contract
E. Succession at Death
1. Testamentary Succession
2. Intestate Succession
F. Procedure

I. HISTORICAL CONSPECTUS

The period of the Roman monarchy (753–510 B.C. according to tradition) and the republic up to the passing of the Twelve Tables (451–450) may be called the period of conjecture in regard to law. The only evidence is unreliable tradition and inference from later institutions.

1. Mid-Republican Period (450–150 B.C.).—Apart from fragments of the Twelve Tables and from the historians, who are chiefly of use for constitutional law, the evidence, when it comes to detail, is not a great deal better than it is for the previous period. The history of law, like the rest of Roman history, suffers from the destruction of records when Rome was burned by the Gauls in or about 387 B.C. Few professedly legal works were written, and none has survived. However, some laws are known, as are certain legal institutions and the names of some famous lawyers. The period is preeminently one of the *jus civile*, as opposed both to the *jus honorarium*, or magisterial law, and to the *jus gentium*, in the sense explained below.

2. Late Republican Period.—For the last century and a half of the republic the evidence is better. A few quotations from legal writers of the time survive in Justinian's *Digest;* Cicero's works contain numerous references to legal matters, and there is other nonlegal literature from which information on law can be deduced, as well as the text of a few laws in inscriptions. In this period magisterial edict comes to be the chief reforming factor in Roman law; it is the period of the earlier *jus honorarium*. The *jus gentium*, too, began to be important; it was probably through the edicts that much of the *jus gentium* found its way into the law as administered between citizens.

Jus gentium has two meanings, one practical, the other theoretical. In the practical sense it means that part of the Roman law which the Romans applied both to themselves and to foreigners. *Jus civile*, as opposed to it, means that part which they applied only to themselves. Roman law, like other ancient systems, adopted originally the principle of personality; *i.e.*, that the law of the state applied only to its citizens. The foreigner was strictly rightless, and unless protected by some treaty between his state and Rome could be seized, like an ownerless piece of property, by any Roman. But from early times there were treaties with foreign states guaranteeing mutual protection. Even where there was no treaty, the increasing commercial interests of Rome made it necessary for it to protect, by some form of justice, the foreigners who came within its borders. A magistrate charged with the administration of such justice could not simply apply Roman law, because that was the privilege of citizens; even had there not been this difficulty, foreigners, especially those coming from Greek cities and used to a more developed and freer system, would probably have objected to the cumbrous formalism which characterized the early *jus civile*.

The law which the magistrates applied probably consisted of three elements: (1) an already existing "law merchant" used by the Mediterranean traders; (2) those institutions of the Roman law which, after being purged of their formalistic elements, could be applied universally to any litigant in a Roman court, whether Roman or foreigner; (3) in the last resort, the magistrates' own sense of what was fair and just. This system of *jus gentium* was also adopted when Rome began to have provinces and provincial governors administered justice to the *peregrini* (foreigners). This word came to mean not so much persons living under another government (of which, with the expansion of Roman power, there came to be fewer and fewer) as Roman subjects who were not citizens. In general, disputes between members of the same (subject) state were settled by that state's own courts according to its own law, while disputes between provincials of different states or between provincials and Romans were resolved by the governor's court applying *jus gentium*. The law thus developed in its turn reacted on the law as administered between Romans, especially by way of making it less formal, with the result that to a considerable extent the two systems were identical, particularly in the law of contract. When a Roman lawyer says that the contract of sale is *juris gentium*, he means that it is formed in the same way and has the same legal results whether the parties to it are citizens or not. This is the practical sense of *jus gentium;* because of the universality of its application, the idea is linked with a theoretical sense, that of a law common to all peoples and dictated by nature, which the Romans took from Greek philosophy.

Aristotle had divided law into the natural (*physikon*) and the man-made (*nomikon*), and had asserted that the natural part was in force everywhere. This conception was in tune with the Stoic ideal of a life "according to nature," which became a commonplace borrowed by the Roman jurists, who, like other educated Romans, were much under the influence of the Stoic system. In their works this theoretical law of nature, "common to all mankind," then becomes identified with the practical law which the Romans administered to all free men, irrespective of citizenship, simply on the basis of their freedom. Moreover, the law of nature became an ideal which helped to introduce notions of moderation and reasonableness into the stricter rules of the older law.

3. Early Empire and Classical Period.—The change from republic to empire did not make any immediate difference to private law, except that by bringing peace after a century of turmoil it was favourable to legal progress. Legal literature, too, increased in volume, and a number of quotations from authors of the 1st century survive in the *Digest*. This age merges into the classical period, which is generally taken to include the 2nd and early 3rd centuries A.D. and is thus considerably later than the classical period of Latin literature. It falls roughly into two divisions, an earlier one covered by the reigns of Hadrian (A.D. 117–138) and the Antonine emperors (death of Commodus, A.D. 192) and a later one under the Severi (accession of Septimius Severus, A.D. 193; death of Alexander Severus, A.D. 235). The work of the earlier period was more creative, while the later represents the working out of existing principles over the whole field of law. The *Digest* has quotations from all the authors of the classical age, but those taken from three writers of the later period—Papinian (d. A.D. 212), Julius Paulus, Ulpian (*c.* A.D. 170–228)—alone comprise over half the work.

4. Postclassical Period.—With the era of confusion that followed the murder of Alexander Severus, there came a rather sudden decline in the value of the legal work done; nor did the restoration of order by Diocletian revive legal literature. The law, of course, did not stand still. New ideas were introduced, especially from Greek sources, through the establishment of the Eastern empire, with its capital at Constantinople, and through the growth of Christianity. The great social and political changes of the sinking empire had repercussions on private law. But not until just before Justinian's time was there something of an intellectual revival in legal matters.

II. SOURCES OF THE LAW

The Romans themselves divided their law into *jus scriptum* (written law) and *jus non scriptum* (unwritten law). By "unwritten law" they meant custom; by "written law" not only that derived from legislation but, literally, that which was based on any source in writing. The list of written sources comprises *leges, plebiscita, senatus consulta, edicta magistratuum, responsa prudentium,* and *constitutiones principum.* This list is repeated in Justinian's *Institutes,* though from the close of the classical period the only source of new law (apart from custom) had been the emperor's constitutions.

A. Jus Non Scriptum or Custom

Custom (*mos maiorum, consuetudo*) was recognized by the Romans not only as having been the original source of their law but as a source from which new law could spring. The theory given by the jurists is that the people, by adopting a custom, show tacitly what they wish to be law, just as they might do expressly by voting in the assembly. In the developed law it would seem, however, that custom as an independent source was not very fruitful and that it exercised its influence rather through the medium of juristic opinion and the practice of the courts.

B. Jus Scriptum

1. Leges and Plebiscita.—*Lex* is properly an enactment of one of the assemblies of the whole Roman people, the *comitia centuriata, tributa,* or *curiata* (*see* Comitia). The first of these is the oldest; it lost all real political function before reliable history began, though for certain formal purposes it lived on into classical times. The validity of *plebiscita* (*i.e.,* resolutions of the purely plebeian assembly) was one of the chief matters of contention between the patricians and the plebeians. The struggle between these orders ended about 286 B.C., when, by the *lex Hortensia, plebiscita* were given the force of *leges.* Thereafter enactments which were strictly *plebiscita* were often loosely called *leges.*

Roman assemblies, like those of the Greek city-states, were primary; *i.e.,* the citizen came and voted himself and did not send a delegate. But their power was restricted by the rule that only a magistrate could put a proposal before them and by the absence of any opportunity for amendment or debate. The only function of the people was to answer "yes" or "no" to the magistrate's "asking" (*rogatio*), and constitutional practice further required that the magistrate should consult the senate before putting a proposal to the assembly. In the later republic bills were hardly ever rejected; the real power lay with the senate and the magistrates.

The historians have a good deal to say of *leges* passed in the time of the kings (*leges regiae*), but legislation at so early a date is unlikely. What they took for laws were probably statements of ancient custom from pontifical sources. Of greater importance are the Twelve Tables, said to have been passed in 451–450 B.C., about 60 years after the expulsion of the kings. The accounts given by the historians (*see* Roman History: *The Monarchy and the Republic*) are inconsistent and mainly mythical, but tradition is no doubt right in representing this event as an incident in the struggle of the plebeians for political equality. The motive was a desire to obtain a written and public code which patrician magistrates could not alter at their will against plebeian litigants. What weight should be given to that part of the story which tells of a preliminary embassy sent to Athens to study the laws of Solon has been much debated. That the embassy itself is legendary can hardly be doubted.

Evidence of Greek influence appears in only a small part of the code (*e.g.,* Tab. VII. 2-D. 10.1.13). In the main the materials of the code were taken from native customary sources. The most authoritative modern opinion is that, in spite of all skepticism as to details, the Twelve Tables were an enacted code of law and that tradition is not far wrong in dating them to about 450 B.C.

The text of the code has not survived, a remarkable fact, for copies (probably in more or less modernized language) must have been abundant in Cicero's time if, as he says, it was still customary in his youth for boys to learn it by heart. Only a few "fragments" are extant, collected from allusions and quotations in the works of such authors as Cicero.

When Augustus established the empire, the assemblies did not at once cease to function, but their assent to any proposal was a mere formal ratification of the emperor's wishes. The last *lex* known to have been passed was a *lex agraria* under Nerva (A.D. 96–98).

2. Senatus Consulta.—A resolution of the senate originally had only advisory effect. It could be translated into enforceable policy through the machinery of a magistrate's edict or through the senate's influence upon a magistrate's proposal for legislation by a popular assembly. The senate acquired legislative power in early imperial times, though this was never conferred on it by any imperial enactment. The resolution of the senate preceding the placing of a bill before the people had always been practically decisive, and with the decay of the *comitia* the people's assent evidently came to be regarded as a formality which might be omitted. Actually, the senate nearly always legislated at the instigation of the emperor, latterly, indeed, simply embodying his *oratio* or proposal in a resolution, and not long after the classical period the emperors ceased to legislate through the senate.

3. Edicta Magistratuum.—An edict was a proclamation, originally no doubt oral, later in writing; any superior magistrate might find it necessary to issue such edicts regarding matters within his competence. A peculiarity of Roman law, however, was that the magistrates entrusted with jurisdiction made particular use of this power and that their edicts became one of the most important sources of law. Originally the duty of *jurisdictio,* which meant supervising the administration of justice rather than actually deciding cases, had presumably lain with the king, from whom it descended to the consuls (*see* Consul). With the growth of business it became impossible for the consuls to discharge this duty in addition to their other functions, and in 367 B.C. a new magistrate, the *praetor* (*q.v.*), was appointed for the purpose. About the year 242 B.C. the increase of foreigners at Rome made it necessary to separate the conduct of suits in which they were concerned from those to which citizens alone were parties, and a second praetor, *praetor peregrinus,* was appointed to deal with cases in which a foreigner was involved. The original praetor, now confined to suits between citizens, came to bear the title *urbanus.*

At Rome the curule aediles (*see* Aedile) issued important edicts; their duties included the supervision of the marketplace. In the provinces supreme judicial power lay with the governors, and quaestors (*see* Quaestor) carried out functions analogous to those of the aediles.

The law derived from the edicts of all these magistrates was called *jus honorarium,* as opposed to *jus civile* in the sense of law based on legislation or custom; but owing to the preeminent position of the praetors, the phrase is often used simply as equivalent to *jus praetorium.* The praetor was not a legislator and could not make law directly as could the sovereign people, but the Roman system of procedure gave him great power over the provision or refusal of remedies as well as over the form which remedies were to take. Thus the edict which he issued at the beginning of his term of office, setting out what he intended to do, was a document of the greatest importance. In it he could say, for instance, "If one man makes such and such an allegation against another, *I will give an action,*" even though the circumstances alleged would not give any right at civil law. In this way, by means of fictions, by modifications of existing civil-law actions, and even by granting new actions based upon facts alleged by the plaintiff, the praetor used the machinery of the edict to expand the substantive law through his control over procedure. The edict called *perpetuum* (continuous) because it was intended to announce the principles which the praetor would follow throughout his year of office, ceased to be valid when that term expired; but it became the practice for each succeeding praetor to take over and reissue as his own much of his predecessor's edict. By the end of the republic, the part thus carried on from year to year (*tralaticium*) must have been considerable, for jurists were just beginning to write commentaries on the edict, a practice which would not have

been worthwhile if the greater part of it had been liable to annual alteration.

The change from republic to empire did not immediately make any difference, and the praetors continued to issue their edicts (though it is doubtful whether they ever made changes without imperial or senatorial authority); but in the long run their wide powers were inconsistent with the emperor's supremacy. In or about A.D. 131 Hadrian therefore instructed the famous jurist Salvius Julianus to revise and settle the praetorian and aedilitian edicts. The changes in substance were not far-reaching, but the revised edict was henceforward made unalterable except by the emperor himself. This revised edict was called *edictum perpetuum*.

The relationship between *jus civile* and *jus honorarium* has often been compared with that existing in England between common law and equity. In both cases may be seen, as Sir Henry Maine put it (*Ancient Law*, p. 25 [1861]), a "body of rules existing by the side of the original civil law, founded on distinct principles, and claiming incidentally to supersede the civil law in virtue of a superior sanctity inherent in these principles"; and in both cases the resulting duality enormously complicated the law. But in detail the comparison no longer holds.

4. Responsa Prudentium.—The force attributed to professional opinions of a certain type was another feature of the Roman system, and one which contributed much to its success; for it was the "learned lawyers" (*prudentes*) who really molded the law into a coherent system.

Originally, law was considered the special province of the *pontifices* (*see* PONTIFEX), who seem to have regarded it as a mystery to be exploited in the interests of their order. Their monopoly was, however, broken from about 300 B.C. The legend is that, in 304 B.C., G. Flavius, a clerk of Appius Claudius Caecus, stole from his master and made public a list of *legis actiones* (*i.e.*, forms of words which had to be followed exactly in the conduct of lawsuits), thereafter known as the *jus Flavianum*. It is more probable that the publication was encouraged by Appius Claudius, and that it coincided with the opening of the pontificate, and therefore of the function of interpreting the *legis actiones*, to plebeians. The first known legal treatise, called the "cradle of the law" by Lucius Pomponius, is the *Tripertita* of Sextus Aelius Paetus Catus (consul 198 B.C.) which contained the text of the Twelve Tables, the *interpretatio* put upon it by the jurists, and the *legis actiones*. Probably the last part was identical with the *jus Aelianum*, which, according to Pomponius, was a collection of *legis actiones* like the earlier *jus Flavianum*.

From about 300 B.C. onward there arose a class of men who made the study of the law their special interest. These *juris consulti* or *juris prudentes* were not professional lawyers in the modern sense but men of rank who sought by giving free legal advice to obtain popularity and advancement in a public career. The *responsa* (answers) which they delivered to those who consulted them were of greater weight than are modern "opinions of counsel" because the person who actually decided a case under the Roman system of procedure was not, as now, a trained lawyer, but a lay *judex*, who did not, like jurymen, have a judge to direct him on points of law. Augustus empowered certain jurists to give *responsa* with the emperor's authority, and this practice led, perhaps gradually, to the view that the *judex* was bound to abide by the prevalent opinion of jurists who had received this *jus respondendi*. Gaius mentions a rescript of Hadrian which laid down that *responsa* were binding if they agreed, and that if they disagreed, the *judex* could decide for himself which to follow. The practice of conferring the *jus respondendi* lapsed at least as early as A.D. 200.

The "law of citations," an imperial enactment of 426, ultimately laid down that only the works of five jurists—Papinian (*q.v.*), Paulus, Gaius (*q.v.*), Ulpian (*q.v.*), and Modestinus (*c.* A.D. 250)—might be cited and, subject to some provisos which are obscure, the works of authors quoted by these five. If the authorities cited disagreed, the majority was to be followed; if numbers were equal, the side on which Papinian stood was to prevail; if he was silent, the *judex* might please himself.

Of the long succession of jurists, mention is here confined to the two "schools," the Sabinians (or Cassians) and the Proculians, into which they were divided in the early empire—though according to one view there had been a similar division in the late republic. Marcus Antistius Labeo (*q.v.*), one of the greatest figures in the history of jurisprudence, was the founder of the Proculians (named after his pupil Sempronius Proculus); Capito was founder of the Sabinians (so called after Masurius Sabinus, who was given the *jus respondendi* by the emperor Tiberius). What principle, if any, divided these schools is unknown, though a number of controversies on particular points are preserved, especially in Gaius' *Institutes*. Probably there were teaching establishments or societies of some sort in connection with the "schools," for Pomponius gives a list of "heads." The division seems not to have survived the Antonine age; Gaius, a Sabinian, is the last jurist known to have belonged to either school.

5. Constitutiones Principum.—Neither Augustus nor his immediate successors expressly assumed legislative power, yet Gaius, about A.D. 160, wrote, "there has never been any doubt that what the emperor lays down has the force of law." Ulpian, indeed, refers the validity of constitutions to the so-called *lex regia*, passed at the beginning of each emperor's reign; and there is in the only surviving example of such a *lex* (the *lex de imperio Vespasiani*, line 17 *et seq.*) a clause conferring such wide powers on the emperor that legislation might be deemed to be included. But this was not the original meaning of the clause; the emperor's legislative power grew gradually. The chief forms of imperial legislation were: (1) *Edicta* (*i.e.*, proclamations) which the emperor, like other magistrates, might issue; but whereas the other magistrates were confined to their own spheres, that of the emperor was unlimited. (2) *Mandata*, or instructions to subordinates, especially provincial governors. (3) *Rescripta*, written answers to officials or others who consulted the emperor, in particular on a point of law; the rescript lays down the point of law applicable, and, since the emperor is supreme, the rule may be new. (4) *Decreta*, or decisions of the emperor sitting as a judge; here too the emperor may lay down a new rule.

6. Earlier Collections of Constitutions.—Long before Justinian's time (*see* below), the growth of legal literature, especially of imperial constitutions, created a need for reference works. A beginning was made, almost certainly in Diocletian's day, by a collection of constitutions known as the *codex Gregorianus*, which was followed by the *codex Hermogenianus*, perhaps also dating in its original form from Diocletian. Both collections were unofficial, but their compilers must have had access to the imperial archives. Whereas the *Gregorianus* contained constitutions from Hadrian to Diocletian, those of the *Hermogenianus* were almost exclusively of Diocletian's time; later constitutions attributed to it probably were added in subsequent editions. The *Hermogenianus* was clearly intended to supplement the *Gregorianus*. Unlike these two, the *codex Theodosianus* was an official work compiled by a commission appointed under Theodosius II and Valentinian III; it had the force of law from Jan. 1, 439. Constitutions from the time of Constantine the Great (reigned 306–337) onward were, with very few exceptions, not to be valid unless contained in the *Theodosianus*. For the earlier imperial legislation the older *codices* still had to serve. Nearly the whole of the *codex Theodosianus* has been preserved, whereas only fragments of the others remain. Theodosius had also planned a collection which would include juristic literature as well as imperial legislation, but this was never realized until Justinian took up the idea again.

C. The Law of Justinian

The emperor Justinian I (reigned A.D. 527–565), remembered chiefly as a legislator and as a codifier of laws, found the law of the Roman Empire in a state of great confusion. It consisted of two masses, which were usually distinguished as old law (*jus vetus*) and new law (*jus novum*).

The old law comprised: (1) all such of the statutes (*leges*) passed under the republic and early empire as had not become obsolete; (2) the decrees of the senate (*senatus consulta*) passed at the end of the republic and during the first two centuries of the empire; (3) the writings of the jurists, and more particularly

of those to whom the right of declaring the law with authority (*jus respondendi*) had been committed by the emperors. As these jurists, in their commentaries upon the *leges, senatus consulta,* and edicts of the magistrates, had practically incorporated all that was of importance in those documents, the books of the jurists substantially include (1) and (2). These writings were very numerous. Many had become exceedingly scarce or had been altogether lost. Some were of doubtful authenticity. They were so costly that even the public libraries had no complete collection. Moreover, they contained many inconsistencies.

The new law, which consisted of the ordinances of the emperors promulgated during the middle and later empires (*edicta, rescripta, mandata, decreta,* usually called by the general name of *constitutiones*), was in a condition not much better. These ordinances or constitutions were extremely numerous. No complete collection existed, for the earlier codices did not include all the constitutions; others had to be obtained separately, and many of them were probably inaccessible to a private person. In this branch of the law too there existed some uncertainty (although less formidable than that of the *jus vetus*), for there were constitutions which practically, if not formally, repealed or superseded others without expressly mentioning them. It was thus necessary to collect into a reasonable corpus so much of the law, both new and old, as was regarded as binding and to purge away its contradictions and inconsistencies.

1. Codex Constitutionum.—Immediately after his accession, Justinian appointed a commission to deal with the imperial constitutions. The commissioners, ten in number, were directed to go through all the constitutions of which copies existed, to select such as were of practical value, to cut these down by retrenching all unnecessary matter, and to get rid of contradictions by omitting one or the other of the conflicting passages. The remaining materials were to be arranged in order of date and gathered into one volume. The commissioners completed their task in 14 months, distributing the constitutions which they "retained" into ten books, in general conformity with the order of the Perpetual Edict enacted by Hadrian. The bulk of the statute law was thus immensely reduced, its obscurities and internal discrepancies in great measure were removed, and its provisions were adapted, by the abrogation of what was obsolete, to the circumstances of Justinian's own time. This *Codex constitutionum* was formally promulgated in 529, all imperial ordinances not included in it being repealed.

2. Digest (Pandects).—The success of this first experiment encouraged the emperor to attempt the more difficult enterprise of simplifying and digesting the writings of the jurists. Before entering on this he took the preliminary step of settling the more important of the legal questions on which the older jurists had been divided in opinion. This was accomplished by a series of constitutions known as the "Fifty Decisions" (*Quinquaginta decisiones*), along with which were published other ordinances amending the law.

Then, in December 530, a new commission was appointed, consisting of 16 eminent lawyers, under the presidency of the jurist Tribonian (*q.v.*), who had served on the previous commission. They were to procure and peruse all the writings of all the authorized jurists; to extract from these writings whatever was of the most permanent and substantial value, with power to change the expressions of the author wherever conciseness or clearness would be thereby promoted, or wherever such a change was needed in order to adapt his language to the condition of the law as it stood in Justinian's time; to avoid repetitions and contradictions by giving only one statement of the law upon each point; to insert nothing at variance with any provision contained in the *Codex constitutionum;* and to distribute the results of their labours into 50 books, subdividing each book into titles, and following the order of the Perpetual Edict.

The commissioners presented their selection of extracts to the emperor in 533, and he published it as an imperial statute on Dec. 16 of that year, with two prefatory constitutions (those known as *Omnem reipublicae* and *Dedit nobis*). It is the Latin volume which is now called the *Digest* (*Digesta*) or *Pandects* (*q.v.*). The extracts comprised in it are 9,123 in number, taken from 39 authors, and are of greatly varying length, mostly only a few lines long. The chief disadvantage of the *Digest* is its highly unscientific arrangement. The order of the Perpetual Edict, which appears to have been taken as a sort of model for the general scheme of books and titles, was doubtless convenient to the Roman lawyers from their familiarity with it, but was in itself rather accidental and historical than logical. A modern jurist has shown that the disposition of the extracts inside each title results from the way in which the committees of the commissioners worked through the books they had to peruse.

In enacting the *Digest* as a law book, Justinian repealed all the other law contained in the treatises of the jurists (the *jus vetus*) and directed that those treatises should never be cited in future even by way of illustration; at the same time he abrogated all the older statutes which had formed a part of the *jus vetus.* But he went too far, and indeed attempted what was impossible, when he forbade all commentaries upon the *Digest.*

3. Institutes.—The *Codex* and the *Digest* held the gist of Justinian's work; but Tribonian decided that an elementary outline was needed to replace the now obsolete *Institutes* of Gaius. Thus were published, shortly before the *Digest,* the *Institutes of Justinian,* a work which still owes much to Gaius, both in matter and style.

4. Revised Codex.—In the four and a half years which elapsed between the publication of the *Codex* and that of the *Digest,* many important changes had been made in the law, notably by the publication of the "Fifty Decisions." Accordingly, another commission was appointed, consisting of Tribonian and four other coadjutors, full power being given them not only to incorporate the new constitutions with the *Codex* and make in it the requisite changes but also to revise the *Codex* generally. This work was completed in a few months; and in November 534 the revised *Codex* (*Codex repetitae praelectionis*) was promulgated with the force of law, prefaced by a constitution (*Cordi nobis*) which sets forth its history and declares it to be alone authoritative.

It is this revised *Codex,* divided into 12 books, which has come down to the modern world. The constitutions contained in it number 4,652, the earliest dating from Hadrian, the latest being of course Justinian's own. A few thus belong to the period to which the greater part of the *Digest* belongs; *i.e.,* the so-called classical period of Roman law down to the time of Alexander Severus (234). But the great majority are later and belong to one or other of the four great eras of imperial legislation, the eras of Diocletian, of Constantine, of Theodosius II, and of Justinian himself. Although this *Codex* is said to have the same general order as that of the *Digest,* viz., the order of the Perpetual Edict, there are considerable differences of arrangement between the two. The *Codex* was of the utmost practical importance to the lawyers of that time, and retains much value, historical as well as legal; but its contents are far less interesting and scientifically admirable than the extracts preserved in the *Digest.*

5. Novels.—Between 534 and 565 Justinian issued a great number of ordinances, dealing with all sorts of subjects and seriously altering the law on many points, the majority appearing before the death of Tribonian (*c.* 545). These ordinances are called, by way of distinction, new constitutions, *Novellae constitutiones post codicem,* and called in English the *Novels.* Although the emperor had stated in publishing the *Codex* that all further statutes (if any) would be officially collected, this promise does not seem to have been redeemed. The three extant collections of the *Novels* are apparently private collections, nor is it even known how many such constitutions were promulgated. One of the three contains 168 (together with 13 edicts), but some of these are by the emperors Justin II, nephew of Justinian, and Tiberius II. Another, the so-called *Epitome of Julian,* contains 125 *Novels* in Latin; and the third, the *Liber authenticarum* or *vulgata versio,* has 134, also in Latin. This last was the collection first known and chiefly used in the West during the Middle Ages. Of its 134 statutes, only 97 have been written on by the *glossatores* or mediaeval commentators; these therefore alone have been received as binding in those countries which recognize and obey the Roman law, according to the maxim *Quicquid non agnoscit glossa, nec*

agnoscit curia ("whatever the gloss does not recognize, the court does not recognize"). And whereas Justinian's constitutions contained in the *Codex* were all issued in Latin, the rest of the book being in that tongue, the *Novels* were nearly all published in Greek, Latin translations being of course made for the use of the western provinces. They may be found printed in any edition of the *Corpus juris civilis*.

6. Corpus Juris Civilis.—The *Corpus juris* consists of the four books described above: (1) *Codex constitutionum;* (2) *Digesta* or *Pandectae;* (3) *Institutiones;* (4) *Novellae.*

Strictly speaking, Justinian did not codify the Roman law. Codification is the reduction of the whole preexisting body of law to a new form and the restating of it in a series of propositions, scientifically ordered, which may or may not contain some new substance but which are at any rate new in form. Justinian did not codify; he consolidated. He gave to posterity not one code but two digests or collections of extracts, which are new only to the extent that they are arranged in a new order and that here and there their words have been modified in order to bring one extract into harmony with some other. Except for this, the matter is old in expression as well as in substance.

Thus regarded, Justinian's work may appear to entitle him and Tribonian to much less credit than they have usually received for it. But the reduction of the huge confused mass of preexisting law into these two collections was an immense benefit to the empire. The work took seven years; the infinitely more difficult task of codification might well have been left unfinished at Tribonian's death, or even at Justinian's own, and have been abandoned by his successor. The extracts preserved in the *Digest* contain the opinions of the greatest legal luminaries, mostly in their own admirably concise language, while the extracts making up the *Codex* afford valuable historical evidence on the administration and social condition of the later empire. To merge on scientific principles the entire law of the empire into one whole was beyond the intellectual powers of Justinian's contemporaries.

The chief defect of the *Digest* is its arrangement, a matter about which the Roman lawyers cared very little. There are some repetitions and some inconsistencies, but not more than may fairly be allowed for in a compilation of such magnitude executed so rapidly. Tribonian has been blamed for the insertions the compilers made in the sentences of the old jurists (the so-called *Emblemata Triboniani*); but it was a part of Justinian's plan that such insertions should be made, so as to adapt those sentences to the law as settled in the emperor's time. On Justinian's own laws, contained in the *Codex* and in his *Novels,* a less favourable judgment must be pronounced. Both, but especially the latter, are diffuse and often lax in expression, prolix, and pompous.

The *Corpus juris* of Justinian, with a few additions from the ordinances of succeeding emperors, continued to be the chief lawbook of the Roman world. In the 9th century a new system was prepared by the emperor Leo VI the Wise, which is known as the *Basilica.* It is written in Greek and consists of parts of the *Codex* and of the *Digest,* joined and often altered in expression, together with some matter from the *Novels* and imperial ordinances posterior to Justinian. In the western provinces, the law as settled by Justinian held its ground; but copies of the *Corpus juris* were rare, nor did the study of it revive until the end of the 11th century. *See* GLOSSATORS, LEGAL.

III. THE LAW OF PERSONS

A. SLAVERY

"The main distinction in the law of persons," says Gaius, "is that all men are either free or slaves." The slave was in principle a human chattel who could be owned and dealt with like any other piece of property. As such, he was not only at the mercy of his owner but rightless and (apart from criminal law) dutiless. But if the slave was in law a thing he was in fact a man, and this modified the principle. In particular, a slave might be manumitted, to become in most cases not only free but a citizen. In fact, during the republican era any manumitted slave of a Roman citizen automatically became a citizen, irrespective of the slave's ethnic origin. Exceptions developed in the early years of the empire.

B. CITIZENSHIP

This was important for the purposes of private law because certain parts of private law applied only to citizens (*jus civile*). The general rule was that, if the status of the parents differed, the child followed that of the father (if the union was one recognized as marriage by Roman law); otherwise that of its mother. The great extension of the citizenship by Caracalla in A.D. 212 reduced the importance of this part of the law.

C. FAMILY

1. Patria Potestas.—The chief characteristic of the Roman family is the *patria potestas* which the father exercised over his children and over his more remote descendants in the male line, whatever their age might be, as well as over those brought into the family by adoption—a very common practice at Rome. This meant originally not only that he had control over the persons of his children, amounting even to a right to inflict capital punishment, but that he alone had any rights in private law. Thus any acquisitions made by a child under power became the property of the father. The father might indeed allow a child (as he might a slave) certain property (*peculium*) to treat as his own, but in the eye of the law it continued to belong to the father. In classical times there were already modifications of the system; the father's power of life and death had shrunk to that of light chastisement, and the son could bind his father by contract with a third party within the same strict limits as applied to slaves and their masters. Sons too could keep as their own what they earned as soldiers (*peculium castrense*) and even make wills of it. In Justinian's day the position as regards property had changed considerably; what the father gave to the son still remained in law the father's property, but the rules of *peculium castrense* had been extended to many sorts of professional earnings (*peculium quasi castrense*), and in other acquisitions (*e.g.,* property inherited from the mother) the father's rights were reduced to a life interest (usufruct). At all times *patria potestas* ceased normally only with the death of the father; but the father might voluntarily free the child by *emancipation,* and a daughter ceased to be under her father's *potestas* if she came under the *manus* of her husband.

2. Marriage.—There were two types of marriage known to the law, one with *manus* and one without, but the *manus* type was rare already in the late republic and had disappeared long before Justinian's day. *Manus* was the autocratic power of the husband over the wife, corresponding to *patria potestas* over the sons, and it might result in any of three ways: (*a*) by *confarreatio,* a religious ceremony confined to patricians; (*b*) by *coemptio,* a type of *mancipatio* (*see* below), purely secular and originally the Roman form of marriage by purchase; (*c*) by *usus*—if a woman lived with a man as his wife for a year, he acquired *manus* over her by a kind of prescription. The Twelve Tables had already provided that *usus* might be prevented if the woman absented herself for three nights during the year (*usurpatio trinoctii*); *usus* was obsolete by classical times.

It may be that at one time marriage with *manus* was the only form of union recognized as marriage at all, but by the time of the Twelve Tables this was no longer so, since the *usurpatio trinoctii,* though it prevented *manus,* left the marriage subsisting, so that it was possible to be married without *manus.*

Marriage without *manus* was by far the more common in all properly attested periods. It was formed (provided the parties were above the age of puberty and, if under *potestas,* had their fathers' consent) simply by the beginning of conjugal life with the intention of being married, and this was normally evidenced by the bringing of the bride to the bridegroom's house. It was, however, legally independent of all attendant ceremonies, if any, and of consummation. The wife remained under her father's *potestas* if he were still alive; if he were dead, she continued (so long as guardianship of women continued) to have the same guardian as before marriage. Both spouses had to be citizens, or if one was not, he or she must have *conubium* (the right, sometimes also given to non-Romans, of contracting a Roman marriage). The chief importance of this was that if a Roman contracted a union with a foreign woman, the children would not be in his *potestas*

unless she had *conubium*.

In marriage without *manus* the property of the spouses remained distinct, and even gifts between husband and wife were invalid. But usually a dowry was given to the husband on the marriage by the woman or her father. This originally became the indefeasible property of the husband, but by classical times the wife could recover it if the marriage ended by divorce or by the husband's death; by Justinian's legislation it always had to be returned to the wife or her heirs.

Divorce was always possible at the instance of the husband in cases of marriage with *manus;* in marriage without *manus* it was free to either party to put an end to the relationship at will. A letter of *repudium* was usual, but any manifestation of intention to end the relationship made clear to the other party and accompanied by actual parting was all that was legally necessary. The Christian emperors imposed penalties on those who divorced without good reason, but the power of the parties to end the marriage by their own act was not taken away.

Concubinatus was recognized in the empire as a sort of morganatic marriage, differing from marriage only by the different intentions of the parties, and excluding marriage, for a man could not have both a wife and a concubine. Constantine first enacted that the children of such unions might be legitimated by the subsequent marriage of their parents, a rule which the medieval civil law extended to all illegitimate children.

3. Guardianship.—*Of Children.*—Persons under the age of puberty (14 for males, 12 for females) needed *tutores* if they were not under *patria potestas*. Such tutors could be appointed under the will of the *pater familias;* failing such appointment the guardianship went to the nearest agnates (*see* below, *Intestate Succession*) until Justinian gave it to the next of kin whether agnatic or cognatic; if there were no qualified relations the magistrates made an appointment.

Of Women.—Originally all women not under *patria potestas* or *manus* needed *tutores*, who were appointed in the same way as those for children. In classical times this *perpetua tutela mulierum* was little more than a burdensome technicality, and it disappeared from Justinian's law.

Of Lunatics and Spendthrifts.—Originally such persons were placed under the *cura* of their agnates; later, magistrates appointed curators.

Of Minors.—Originally children were considered adult at the age of puberty; but, by a long development, it became usual for those above puberty and under 25 to have *curatores* who were always magisterially appointed. (H. F. J.; Rl. P.)

D. Corporations

Surviving sources of the Roman law of corporations are extremely scanty. Moreover, in most matters corporations were regarded as pertaining to public rather than private law, so that juristic discussion of the topic was minimal.

The Romans did not develop a generalized concept of juristic personality in the sense of an entity susceptible of rights and duties. They had no terms for a corporation or a legal person. But they did endow certain aggregations of persons as such with particular powers and capacities, and the underlying legal notion hovers between corporate powers, as understood in modern law, and powers enjoyed collectively by a group of individuals. The source of such powers, however, was always an act of state.

Four types of corporation may be distinguished:

1. *Municipia (i.e.,* the citizen body, originally of the conquered cities, and later of other local communities), whose corporateness was recognized in such matters as the power to acquire things *inter vivos,* and to contract. In imperial times, they are accorded the power to manumit slaves, take legacies, and finally—though this became general only in postclassical law—to be instituted heir.

2. The *populus Romanus,* which could acquire property, make contracts, and be appointed heir. Such property included property of the treasury (*aerarium*) and was thought of as *res publicae*. The *fiscus,* which in postclassical times superseded the *aerarium,* vested in the emperor as a personification of the state, somewhat like the English corporation sole.

3. *Collegia,* private associations with specialized functions, like craft or trade guilds, burial societies, and societies dedicated to special religious worship. These seem to have carried on their affairs and to have held property corporately in republican times and were apparently numerous. The emperors, viewing the *collegia* with some suspicion, enacted from the beginning that no *collegium* might be founded without state authority, and such rights as the manumission of slaves and the taking of legacies were closely regulated. Unfortunately, the basic law of classical times, the *Lex Julia de Collegiis,* has not survived.

4. Charitable funds. Postclassical law saw the development of corporations *ad pias causas;* property might be donated or willed —normally, but not necessarily, to a church—for some charitable use. It seems that the church would then have the duty to supervise the fund. Imperial legislation controlled the disposition of such funds so that their alienation in excess of powers was void. Ownership is thought in such cases to have vested in the administrators for the time being. Some scholars contend that the fund itself was the owner, as in the *Stiftung* of German law. Such a view, however, seems excessively abstract for Roman thought; further, it offends the rule that corporate powers can exist only if conceded by the state.

It is much controverted whether partnerships which contracted with the state for purposes such as tax collecting (the *societas vectigalis*), mining, or quarrying might rank as corporations, but the textual material is too slender to yield a conclusive answer. The commercial corporation characteristic of modern times does not figure in Roman law. (M. A. Mr.)

IV. THE LAW OF PROPERTY AND POSSESSION

The most striking thing to a lawyer accustomed to the complexities of Anglo-U.S. real property law is the absence of any fundamental distinction among the Romans between the treatment of land and the treatment of movables. In Roman law as known today, both can be owned absolutely by individuals, though there may have been a time at Rome as elsewhere when land was subject to communal ownership of some sort. This conception of absolute ownership (*dominium*) also is characteristically Roman, as opposed to the relative idea of ownership as the better right to possession which underlies the Germanic systems; although this also, originally, underlay that of Rome. This can be seen by comparing the form of a *vindicatio* (the claim of an owner out of possession) under the *legis actio* system of procedure with that which it later assumed under the formulary system. In the earlier system the plaintiff first makes his assertion of ownership ("I say that this thing is mine") and then the defendant makes a similar assertion. Finally, the thing goes to the one whose assertion is based on the better right. Under the later formulary system there is no assertion by the defendant at all; the *judex* is instructed to condemn the defendant if it appears to him that the thing belongs to the plaintiff, otherwise to absolve the defendant. Hence, unless the plaintiff makes good his title absolutely, the defendant, though he may have no title at all, remains in possession.

Much property jurisprudence comes under the heading "methods of acquiring ownership." These were divided into two classes according as they fell under the *jus civile* or the *jus gentium.*

A. Methods of the Jus Civile

1. Mancipatio.—This was a ceremonial conveyance needing for its accomplishment the presence of the transferor and transferee, five witnesses (Roman citizens of full age), a pair of scales, a man to hold them (*libripens*), and an ingot of copper. The transferee grasped the thing and said: "I assert that this thing is mine by Quiritarian law; and be it bought to me with this piece of copper and these copper scales." He then struck the scales with the ingot, which he handed to the transferor "by way of price." Clearly this was, as Gaius says, a "symbolical sale," and the relic of a real sale. Originally, when money was unknown, the price in uncoined copper had been really weighed out to the vendor. When this became unnecessary there was still a pretense of weighing, but the price was paid separately, and the form could be used as a conveyance where it was not intended that a price should be paid at all;

e.g., because the transferor was making a gift to the transferee.

2. In Jure Cessio.—This was a conveyance in the form of a lawsuit. The transferee claims before the magistrate that the thing is his, and the transferor, who is the defendant, admits the claim. The magistrate then adjudges the thing to the transferee. The sham-lawsuit theory is not acceptable to all scholars, principally because the judgment of ownership was valid against any possible private claimant, not merely against the defendant as in a true lawsuit.

3. Usucapio.—According to the Twelve Tables, two years' continuous possession gave title in the case of land, one year in the case of movables. In the developed law, possession must have begun in good faith, the thing must not have been stolen (even though the possessor himself is quite innocent of the theft) or occupied by violence (this applies especially to land, which could not be stolen), and the possession must have had a justifiable beginning (*justus titulus*). *Usucapio*, being an institution of the *jus civile*, was possible only to citizens, but Justinian fused it with a similar institution (*praescriptio longi temporis*) which had grown up in the provinces. Under his system, possession for 3 years was required for movables, 10 or 20 years for land.

B. Methods of the Jus Gentium

1. Occupatio.—Ownerless things, provided they are capable of private ownership (not, *e.g.*, *res sacrae*, such as temples), became the property of the first person to take possession of them. This applies, *e.g.*, to wild animals and to islands arising in the sea. In some views, it also applies to abandoned articles.

2. Accessio.—If an accessory thing belonging to *A* was joined to a principal one belonging to *B*, the ownership in the whole went to *B*; *e.g.*, if *A*'s purple be used to dye *B*'s cloth, the dyed cloth belongs wholly to *B*. By far the most important application of this rule is expressed by the maxim *superficies solo cedit*; *i.e.*, whatever is built on land becomes part of the land and cannot be separately owned.

3. Specificatio.—If *A* made a thing out of material belonging to *B*, the Proculian school held that ownership went to *A*, the Sabinian school that it remained in *B*. Justinian adopted a "middle opinion," according to which *B* retained ownership if reconversion to the original condition was possible (a bronze vase can be melted down); *A* obtained ownership if it was not (wine cannot be reconverted into grapes).

4. Thesauri Inventio.—The final rule on treasure trove was that if it were found by a man on his own land, it went to him; if on that of another, half went to the finder, half to the landowner.

5. Traditio.—This was simple delivery of possession with the intention of passing ownership, and was the method of conveyance of the *jus gentium*. It sufficed to pass full Quiritarian ownership of *res nec mancipi*, but not of *res mancipi* (land in Italy, slaves, beasts of draft and burden, and certain rustic servitudes) for which either *mancipatio* or *in jure cessio* was necessary. If therefore *A* sold and merely delivered a slave to *B*, *A* remained at civil law owner of the slave until *usucapio* had taken place. The praetor, however, devised methods of protecting *B*'s possession in such a way that *A*'s title became valueless, and *B* was said to have the thing *in bonis*. From this phrase later writers coined the expression "bonitarian" ownership; the term "praetorian ownership" also has been applied, in recognition of the role of the praetor in developing the concept. Before Justinian's day *mancipatio* and *in jure cessio* had become obsolete, and Justinian took the final step of abolishing the theoretical distinction between Quiritarian and "bonitarian" ownership.

C. Forms of Property in Land Other than Ownership

The ordinary leaseholder according to Roman law had no protection beyond a contractual right against his landlord, and he could not assign his tenancy, but there were two kinds of tenure which, under the praetorian system, obtained for the tenant protection against third parties as well, and became assignable. These were *superficies* and *emphyteusis*, the former resulting from building leases granted for a long term or in perpetuity, the latter from similar agricultural leases. Both appear to have first originated in grants by the state or by municipalities. Under *emphyteusis* the grantee did not become owner though he enjoyed a *jus in re aliena* hardly distinguishable from ownership.

1. Servitudes.—Praedial servitudes (*i.e.*, easements or *profits à prendre*) were divided into two categories, rustic and urban, according as they served the need of agricultural land or of buildings. Thus rights of way and of water are usually classed as rustic, while rights to light, to view, or to support were urban. Praedial servitudes could only be appurtenant; *i.e.*, they could not exist except as additional advantages attached to the ownership of a piece of land (the "dominant tenement").

The law of Justinian's day brought under the heading of servitudes also the rights of *usufructus* and *usus*. Usufruct was the right to use and take the fruits (*e.g.*, crops) of a thing and corresponds to the modern life interest. *Usus* was a more restricted right, likewise not extending beyond the life of the holder but merely to the use of a thing; thus the usuary of a house could live in it himself but could not let it, as that would be equivalent to taking the fruits.

2. Possession.—Since ownership was absolute, it was sharply distinguished from possession, which the civil law did not protect as such. One of the most important parts of the praetorian system was constituted by the *interdicta* (special types of remedy), which protected an existing possession irrespective of its rightfulness. Anyone wishing to interfere with it must bring an action and prove his title. If he interfered on his own authority, the praetor would see that the original state of affairs was restored.

D. Obligations

Obligations were classified by the jurists into two main categories, according as they arose from delict (tort) or contract; those left over were placed by the Byzantines under the headings of quasi-contract and quasi-delict. Quasi-contractual remedies are of peculiar importance because they mark the recognition, in defined spheres, of obligations founded on the principle of unjust enrichment, one of the major contributions of Roman law to legal thought.

1. Delict.—The Twelve Tables already show the law in a state of transition from the system of private vengeance to that in which the state insists on the acceptance of compensation instead of vengeance by the person wronged and fixes its amount. Thus in the case of assault (*injuria*), if one man broke another's limb, talion was still permitted (*i.e.*, the person wronged could inflict the same injury as he had received); but in other cases there were fixed money penalties (*e.g.*, 25 *asses* for a blow). Theft involved a penalty of twice the value of the thing stolen, unless the thief was caught in the act (*furtum manifestum*), in which case he was flogged and "adjudged" to the person wronged.

In classical times, praetorian reforms had substituted a fourfold penalty in the case of *furtum manifestum*, and penalties for *injuria* (which now included defamation and insulting behaviour) were assessed in each case by the court. The law of damage to property was regulated by a statute (*lex Aquilia*) dating from the republic but later than the Twelve Tables; it was much extended by interpretation and by the praetor. Praetorian actions also lay for a number of new delicts of varying importance.

2. Contract.—At the time of the Twelve Tables a law of contract hardly existed. However, there was an institution called *nexum*, of which little can be said with certainty except that it was a kind of loan so oppressive in character that it might result in the debtor's complete subjection to the creditor. It was obsolete long before classical times. The contracts of classical law were divided into four classes: literal, verbal, real, and consensual. The literal contract was a type of fictitious loan formed by an entry in the creditor's account book; it was comparatively unimportant, and obsolete in Justinian's day. The verbal contract or *stipulatio* was of great importance, for it provided a form in which any agreement (provided it was lawful and possible) might be made binding by the simple method of reducing it to question and answer; *e.g.*, "Do you promise to pay me ten thousand sesterces?" "I promise." Originally it was absolutely necessary that the words should be spoken, but it may be said (technicalities apart) that by

Justinian's day a written memorandum of such a contract would be binding, even though in fact there had been no speaking at all.

If an agreement was not clothed in the form of a stipulation, it must, to be valid, fall, according to its content, under one of the types of real or consensual contracts. A real contract is one which needs for its conclusion (in addition to the consent of the parties) that some thing should be transferred from one party to the other and that the obligation arising should be for the return of the thing transferred. The real contracts are *mutuum* (loan, *e.g.*, of money), *commodatum* (loan, *e.g.*, of a horse), deposit, and pledge. Consensual contracts need no element for their formation except agreement—whether expressed in words or otherwise—between the parties, and though there were only four such known to the law, these were the most important in ordinary life—*emptio venditio* (sale), *locatio conductio* (hire of things or services and also giving out of jobs to be done), *societas* (partnership), and *mandatum* (acting upon instructions). In Justinian's day there was a further principle that in any case of reciprocal agreement, *e.g.*, an agreement for exchange (which was not sale), if one party had performed, he could bring an action to enforce performance by the other ("innominate contract"). Apart from the foregoing contracts, a few specific agreements were recognized as enforceable. But the general recognition of all serious agreements as binding was never achieved by the Romans.

E. Succession at Death

1. Testamentary Succession.—That wills existed already at the time of the Twelve Tables is certain, and it is highly probable that the form used was still that mentioned by Gaius as the oldest; *i.e.*, the will made publicly in the assembly of the *curiae* (*testamentum comitiis calatis*), with the will made before the people drawn up for battle (*testamentum in procinctu*) as a variant. It may be, however, that the mancipatory will (*testamentum per aes et libram*) had already been invented. This began as an expedient for effecting the purposes of a will in an emergency, when the other forms were impossible, and consisted in the use of mancipation to convey the estate of the dying man to a kind of trustee (*familiae emptor*), who then distributed it in accordance with the testator's instructions. By the end of the republic the older forms had disappeared, mancipation had become a mere formality, and the testator's instructions, now contained in a written document, constituted a true will, operative only at death and revocable at any time during the testator's lifetime by the making of a new will. In postclassical times the mancipation had ceased to be necessary, and the commonest form of will was the *testamentum tripertitum*, needing for its completion the seals of seven witnesses and the signatures of the witnesses and testator.

The first requirement of any Roman will of historical times was the appointment of one or more *heredes*. A *heres* is a universal successor; *i.e.*, he takes over the rights and duties of the deceased (in so far as they are transmissible at all) as a whole. On acceptance, the heir becomes owner where the deceased was owner, creditor where he was creditor, and debtor where he was debtor, even though the assets be insufficient to pay the debts. It was thus possible for an inheritance to be *damnosa; i.e.*, to involve the heir in loss. Until Justinian's day this consequence could be avoided only by not accepting the inheritance, but Justinian made one of his most famous reforms by introducing the *beneficium inventarii*, which meant that the heir who, within a certain time after the acceptance, made an inventory of the deceased's assets need not pay out more than he had received. In addition to appointing an heir, the testator might also leave legacies; *i.e.*, particular gifts which are a burden on the heir. Freedom of testation was, however, not complete, a man being obliged to leave a certain proportion of his property to his children and in some cases to ascendants and brothers and sisters.

2. Intestate Succession.—For intestate succession a purely agnatic system (one which counts relationship only through males) was superseded by a cognatic system (in which relationship is traced through males or females). The agents in this change were first the praetors and, later, imperial legislation.

By the Twelve Tables those first entitled were the *sui heredes* of the deceased; *i.e.*, those who were in his *potestas* or *manus* when he died and became free from power at his death. Failing these, the nearest agnatic relation (or relations, if there were several of the same degree) succeeded, and, if there were no agnates, the members of the *gens* (clan) of the deceased. Praetorian reforms placed emancipated children on an equality with *sui heredes* and gave to the nearest cognates or, failing them, to the surviving spouse (in marriage without *manus*) rights of succession in the absence of agnates; gentile succession became obsolete probably in the 1st century A.D. Even under this system a woman would not succeed to a child of hers if any agnate (*e.g.*, a paternal uncle) were alive, nor a child to its mother if there were any agnate of hers. Both these cases were dealt with before the end of the classical period, the former by the *Senatus consultum Tertullianum* (under Hadrian), which gave certain rights of succession to mothers who had the *jus liberorum* (*i.e.*, had borne three children), and the latter by the *Senatus consultum Orfitianum* of A.D. 178, which gave to children the first right to succeed to their mothers. Later emperors made many changes, but it was not until Justinian's day that the cognatic system prevailed. *Novel* 118, completed by *Novel* 127, introduced a new system, laying down that descendants had the first claim, and failing these, a composite class consisting of ascendants, brothers and sisters of full blood, and children of deceased brothers and sisters. Next came brothers and sisters of the half blood and finally the nearest cognate or cognates.

Husband and wife were not mentioned, but their old (praetorian) rights were kept alive in the absence of any of the above categories. Justinian also gave to the poor widow a right to one quarter of her husband's estate unless there were more than three children, in which case she shared equally with them. If, however, the heirs were her own children by the deceased, she only received the usufruct (life interest) in what she took.

F. Procedure

The earliest form of procedure known to have existed is that of the *legis actiones;* this was superseded by the formulary system which, in its turn, gave way to *cognitio extraordinaria*. Characteristic of both the earlier systems is the division into two stages, a preliminary one before the jurisdictional magistrate (*in jure*) and the actual trial before the *judex*. The object of the first stage is to arrive at an issue, which under the *legis actio* system has to be achieved by the speaking of set forms of words by the parties and, sometimes at least, by the magistrate. Thus in a *vindicatio* each party, when making his assertion of ownership, grasps the thing in dispute and lays a wand on it, after which the magistrate intervenes and says, "Let go, both of you." So formal was the procedure that a plaintiff who made the slightest mistake lost his case. For this the formulary system provided a remedy. It superseded the older system, so Gaius says, as a result of the *lex Aebutia* (date much disputed, perhaps between 149 and 126 B.C.), and two *leges Juliae* (of Augustus). Between the *lex Aebutia* and the *leges Juliae* both systems were in use.

Under the new procedure the issue was formulated in written instructions (*formula*) to the *judex*, couched in the form of an alternative, *e.g.*, "If it appears that the defendant owes the plaintiff 10,000 sesterces the *judex* is to condemn the defendant to pay the plaintiff 10,000 sesterces; if it does not so appear, he is to absolve him." A draft of the *formula* was probably prepared for the plaintiff before he came into court, but there could be no trial until it was accepted by the defendant; for there was always a contractual element about a lawsuit under both older systems. Pressure could, however, be exercised by the magistrate on a defendant who refused to accept a *formula* of which the magistrate approved, just as a plaintiff could be forced to alter a *formula* of which the magistrate disapproved, by the magistrate's refusal otherwise to give his order to the *judex* to decide the case.

The process by which the *cognitio extraordinaria* superseded the formulary system was gradual, and was accomplished in the provinces earlier than in Rome. Under the new system the magistrate used his administrative powers, always large, for the purpose of settling disputes. He could command, and thus if one man brought a complaint against another before him, he could investigate the

matter and give the order he thought fit. As imperially appointed officers, who had *no jurisdictio* in the old sense, superseded republican magistrates, this administrative process became more common. The result is that the old contractual element in procedure disappears, as well as the old division into two stages. Justice is now imposed from above by the state, not, as originally, left to a kind of voluntary arbitration supervised by the state.

ROMANO, GIULIO (GIULIO PIPPI, originally GIULIO DI PIETRO DI FILIPPO DE' GIANUZZI) (?1499–1546), painter, architect, principal heir of Raphael and one of the founders of Mannerism (*q.v.*). As his name implies, Giulio was born in Rome, but the exact date is unknown. According to the archives of Mantua, where he died, he was 47 at his death on Nov. 1, 1546, so that he was presumably born in 1498/99. G. Vasari, however, says that he was 54 at his death (which he dates correctly), thus making his birth fall in 1491/92. The earlier birthdate, which is not usually accepted, would make Giulio less precocious. He certainly went to Raphael as a child apprentice and had become so important in the workshop by Raphael's death in 1520 that Vasari names him with G. Penni as Raphael's chief heir; he became his principal artistic executor. Among the works of Raphael which Vasari specifically records as having been worked on by Giulio are the frescoes in the Sala dell'Incendio in the Vatican, completed in 1517, and many of the frescoes, from Raphael's designs, in the *logge,* certainly finished by June 16, 1519. He also worked on such oil paintings as the "Joanna of Aragon" and the "St. Margaret" for the king of France, both now in the Louvre, Paris, and both of about 1518. His facility was almost proverbial and is testified to by his works, as well as by Vasari.

In the period between Raphael's death on April 6, 1520, and Oct. 1524, when Giulio went to Mantua, it is clear that he and Penni finished a number of works left incomplete at Raphael's death. The most important such commission was the Sala di Costantino, the last and largest of the Vatican rooms, which had hardly been begun by Raphael. After some intrigue, Giulio and Penni secured the contract, completing the frescoes on Sept. 5, 1524. The two certainly finished the "Coronation of the Virgin" (now in the Vatican) for the nuns of Monteluce, Giulio painting the upper part and Penni the lower. They may also have put the finishing touches to the "Transfiguration." Giulio also painted some original works during these years, including the "Madonna and Saints," now in Sta. Maria dell' Anima, Rome; the "Stoning of St. Stephen" (1523; S. Stefano, Genoa); and the Naples "Madonna." He also undertook some of the decorative painting at the Villa Madama, begun under Raphael's general direction in 1516, and at the Villa Farnesina. The Roman palaces of the Cicciaporci and Maccarani families, closely based on the palace of Raphael by Bramante, are also by him.

Giulio left Rome in Oct. 1524 for Mantua, apparently at the request of Federigo Gonzaga, marquis of Mantua. Very soon, there was a great scandal over some obscene engravings which Marcantonio Raimondi (*q.v.*) had made from Giulio's drawings; Raimondi was imprisoned, but Giulio was by then safe in Mantua. Much the most important of all his works is the Palazzo del Te, on the outskirts of Mantua, begun in 1525 or 1526 and built and decorated entirely by him and his pupils. This palace is one of the first and greatest examples of Mannerist architecture, being almost a parody of the serene classicism of Bramante while retaining the forms of Roman antiquity. The building consists of a square block around a central court, with a splendid garden opening off at right angles to the main axis—in itself characteristic of the way in which all the elements are slightly different from what would be expected. There is a series of splendid staterooms, mostly decorated in the rich but elegant Roman manner invented by Raphael on the basis of the recently rediscovered Golden House of Nero. The principal rooms are the Sala di Psiche, with erotic frescoes of the loves of the gods; the Sala dei Cavalli, with life-size portraits of some of the Gonzaga horses; and the fantastic Sala dei Giganti. This is one of the showpieces of Mannerist decoration and consists of a room, roughly square, which is painted from floor to ceiling with a continuous scene of the giants attempting to storm Olympus and being repulsed by the gods. On the ceiling, Jupiter hurls his thunderbolts, and the spectator is made to feel that he, like the giants, is crushed by the mountains which topple on to him, writhing in the burning wreckage. Even the fireplace was incorporated into the decoration, and the flames had a part to play. This room was completed by 1534, with much help from Rinaldo Mantovano, Giulio's principal assistant. The colour is very crude; the subject is all too suited to virtuosity and tends to bring out the streak of cruelty and obscenity which runs just below the surface in much of Giulio's painting.

In Mantua itself he did a great deal of work (including the Sala di Troia) in the huge Reggia dei Gonzaga. He also built for himself a very Mannerist version of the house of Raphael (1544–46) and began the rebuilding of the cathedral (1543 onward). The decorations of the Sala di Troia are particularly noteworthy in that they look forward to the illusionistic ceiling decorations of the baroque; but this was probably inspired by the presence in Mantua of the Camera degli Sposi by Andrea Mantegna, who must have inspired Giulio to further audacities of illusionism, as well as confirming his taste for antique motives. *See* also RENAISSANCE ARCHITECTURE: *Italy: Mannerism.*

ROMANOS, SAINT (called MELODOS) (fl. 6th century A.D.), Byzantine hymnographer and greatest master of the *kontakion* (*q.v.*), was born at Emesa (Homs) in Syria. After officiating as deacon at Berytus (Beirut), he went to Constantinople during the reign of the emperor Anastasius I (491–518). Legend relates that when asleep one Christmas eve he was commanded by the Virgin to eat a scroll, and on awaking after doing so he recited his famous Christmas *kontakion.* About 80 of his *kontakia* are extant but none of the music accompanying them survives. This literary form reached its full development in Romanos' *kontakia,* with their elaborate metrical system and vigorous dialogues, but they often contain too many rhetorical devices for modern taste. Romanos borrows heavily from earlier Greek sermons and other sources, though it is not certain whether he also depends on Ephraem Syrus. His most famous *kontakia* are perhaps those on Christmas, Easter, and the Passion. His feast day is Oct. 1.

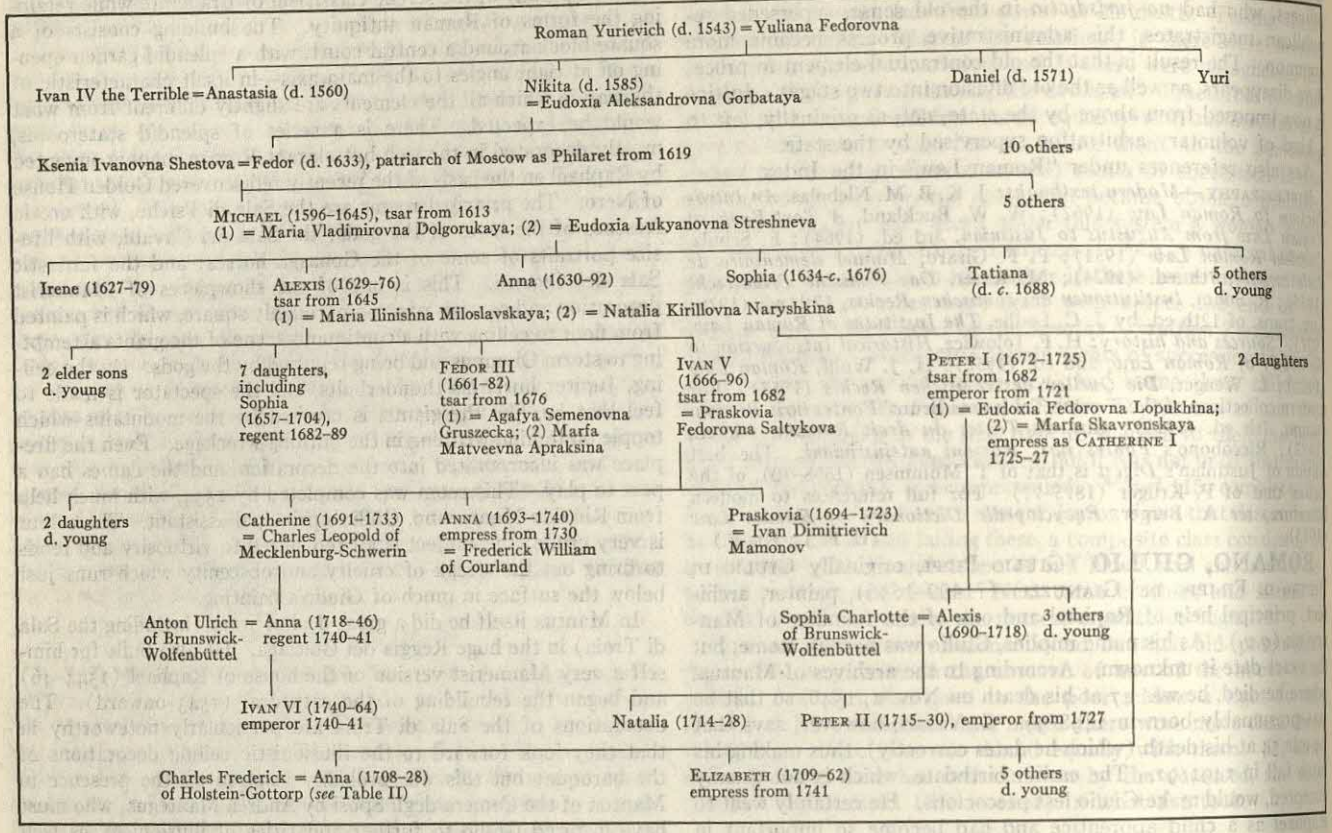
A complete edition of Romanos' *kontakia,* edited by P. Maas and C. A. Trypanis, was published in 1963. G. Cammelli edited selections, with an Italian translation, in 1930.

See H. G. Beck, *Kirche und theologische Literatur im byzantinischen Reich* (1959); K. Krumbacher, *Geschichte der byzantinischen Literatur,* 2nd ed. (1897). For further bibliography, *see* KONTAKION. (CE. A. T.)

ROMANOV, the name of the dynasty that ruled Russia from 1613 to the March Revolution of 1917.

The ancestor of the Romanovs was Andrei Ivanovich Kobyla, or Kambila, who is recorded as a boyar (*q.v.*) in Moscow during the reign of the grand prince Ivan I Kalita, of the House of Rurik, in the middle of the 14th century. This Kobyla is sometimes said to have been the son of the Old Prussian or Lithuanian prince Glanda, who had come to Russia as a refugee and taken the name Ivan on receiving Christian baptism. One of Kobyla's many sons, Fedor Andreevich, was known as Koshka ("the Cat"), and his descend-

TABLE I.—*The Romanov Dynasty to 1762*



ants received the surname of Koshkin. These Koshkins were soon divided among many branches: for instance, the Zakharievs, descending from one of Fedor's grandsons, Zakhari; and the Yurievs, descending from one of Zakhari's sons, Yuri. Thus one of Yuri's sons, Roman (d. 1543), gave the surname Romanov to his own descendants.

Roman's daughter Anastasia was the first wife of the tsar Ivan IV the Terrible, who married her in 1547. Her brother Nikita was president of the council of regency that Ivan IV appointed for his son by her, Fedor I, the last tsar of the House of Rurik; but on Nikita's death control of the regency passed to Boris Godunov. Boris, who became tsar himself on Fedor I's death (1598), forced Fedor Nikitich Romanov to become a monk, whereupon the latter took the name Philaret (*q.v.*). The Romanov boyars, however, were active during the movements against Boris and against the tsar Vasili Shuiski, and the period known in Russian history as the "Time of Troubles" ended with the election of Philaret's son Michael as tsar in 1613.

The article RUSSIAN HISTORY provides the background to what has been indicated above and then a survey of the subsequent regime of the Romanovs. Tables I and II of the present article show the genealogy of the tsars and (from 1721) of the emperors and empresses of the dynasty, all of whom are also treated in separate biographical articles. A few words may here be added on the dynasty in general.

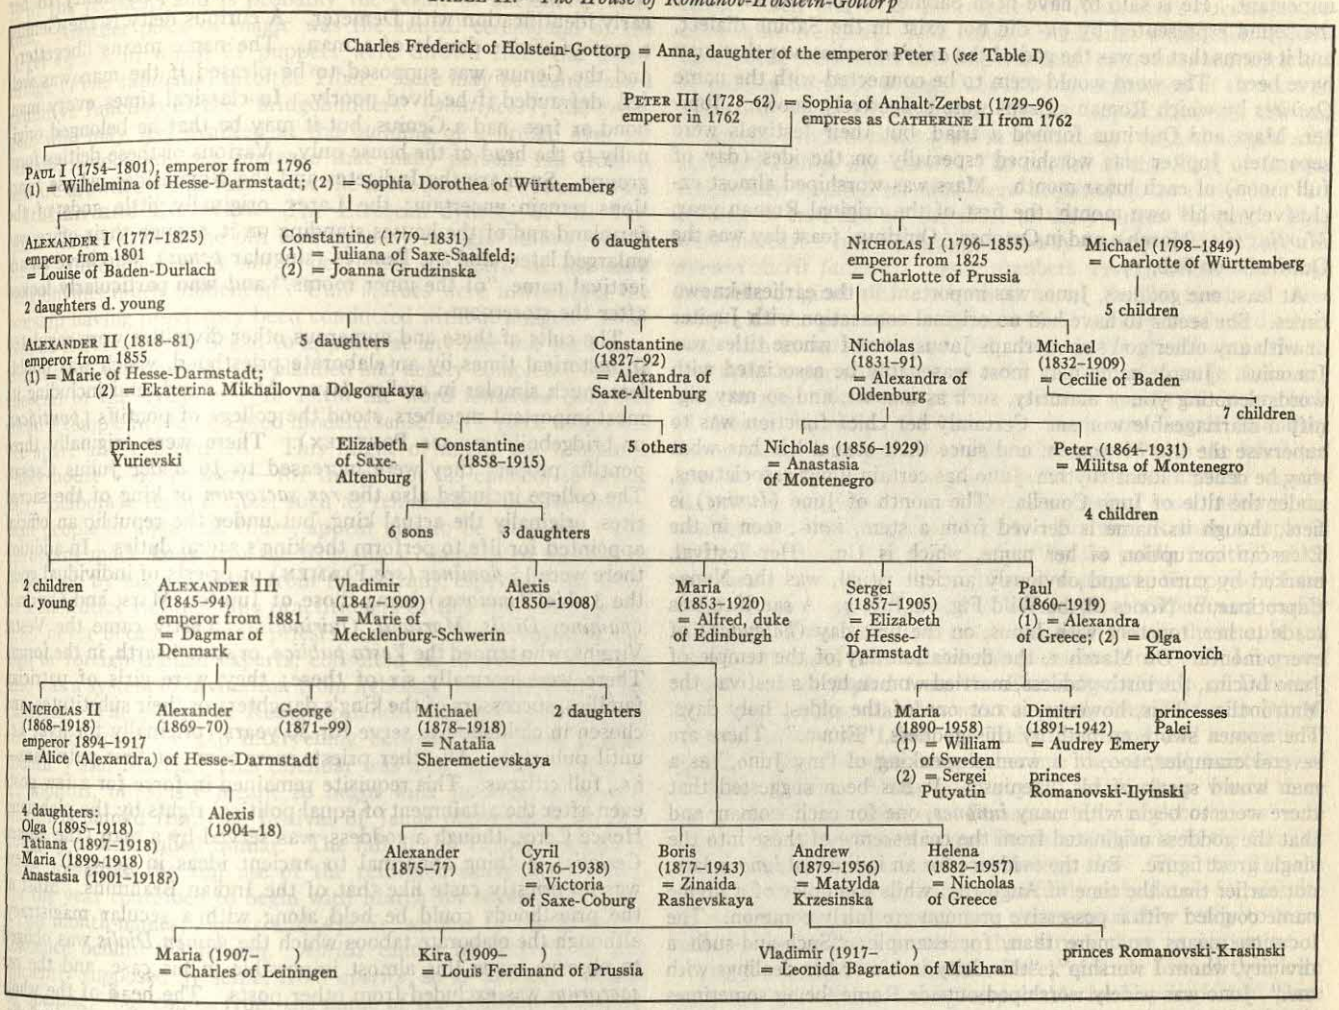
In the first place, accession to the Russian throne, which had been governed by a form of collateral succession under the House of Rurik, was a precarious matter from the end of the 16th century to the end of the 18th. The ruler might try to designate his successor without regard to primogeniture, and even if primogeniture were observed, a weak successor might soon be set aside if a stronger member of his kin, male or female, could organize a *coup d'état*. This state of affairs gave rise to the 18th-century saying that the Russian throne was "not hereditary or elective, but occupative."

Thus in the 1680s the accession of the half brothers Ivan V and Peter I led to grave disorders, from which Peter emerged victorious; but Peter, having put his own son Alexis to death in 1718, left the succession to his wife, Catherine I, who was a Romanov only by right of marriage. On Catherine I's death, however, in 1727, the throne reverted to Peter I's grandson Peter II. When the latter died (1730), Ivan V's second surviving daughter Anna became empress. On Anna's death (1740), her elder sister's daughter Anna Leopoldovna, whose father belonged to the House of Mecklenburg, assumed the regency for her son Ivan VI, of the House of Brunswick-Wolfenbüttel; but in 1741 this Ivan VI was deposed in favour of Elizabeth, daughter of Peter I and Catherine I. With Elizabeth the Romanovs of the male line died out in 1762, but the name was conserved by the branch of the House of Holstein-Gottorp which then mounted the Russian throne in the person of Elizabeth's nephew Peter III. From 1762 to 1796 Peter III's widow, a German princess of the House of Anhalt-Zerbst, ruled as Catherine II, but with Paul I, Peter III's son, a Romanov of Holstein-Gottorp became emperor again. Thereafter primogeniture usually obtained. Even so, in 1825, Alexander I was succeeded, not by his eldest surviving brother, Constantine (who had secretly renounced his rights), but by the next brother, Nicholas I; and in 1917 Nicholas II abdicated the throne, not in favour of his son, the sickly Alexis, but in favour of his brother Michael, who, however, did not assume the succession.

In the course of the Russian Revolution the Bolsheviks killed the emperor Nicholas, his consort, all his children (unless one believes the claimant to Anastasia's identity, who appeared in 1928), his brother Michael, and other members of the dynasty between July 1918 and February 1919. The grand duke Cyril, in exile, proclaimed himself warden of the throne, as head of the House of Romanov, in 1922 and emperor in 1924.

By an imperial ruling of 1886, applicable to the offspring of marriages made in conformity with the laws of the House of Romanov as a sovereign dynasty, the sons, daughters, brothers, and sisters of emperors, and also the grandchildren of emperors in the male line, were to bear the title of grand duke or grand duchess (properly grand prince or grand princess; *see* GRAND DUKE), with the predicate "Imperial Highness"; great-grandchildren of emperors in the male line, and also the first-born son of each such great-grandson, were to be princes or princesses with the predicate

TABLE II.—*The House of Romanov-Holstein-Gottorp*



"Highness"; and other descendants in the male line were to be princes or princesses with the predicate "Serenity."

From the 19th century onward morganatic marriages by Romanov males were increasingly frequent. In such cases a princely title, with a new name, was often accorded to the morganatic wife and her issue. Apart from the Yurievski and Palei princely titles created by the emperors in 1880 and 1915 (*see* Table II), the grand duke Cyril in 1935 accorded not only the Romanovski-Krasinski and Romanovski-Ilyinski princely titles (indicated in the same Table), but also a Romanovski-Brasov princely title for Natalia Sheremetievskaya, widow of his first cousin Michael, as well as Romanovski-Kutuzov and Romanovski-Strelinski princely titles for the wives and issue of more remote cousins (great-grandsons of the emperor Nicholas I through the latter's sons Michael and Constantine respectively). These titles must not be confused with the Russian title of Prince Romanovski granted in 1852 to Nicolas, duke of Leuchtenberg, son of the emperor Nicholas I's daughter Maria by her marriage to Maximilien de Beauharnais (*see* BEAUHARNAIS).

ROMAN RELIGION. The religion of ancient Rome, from the earliest known times to the final suppression of paganism, may be conveniently divided into four periods: (1) native; (2) Italian (including Etruscan); (3) Greek, passing into Greco-Roman; and (4) oriental. These divisions emphasize the principal influence at each stage, without implying that no other influences existed.

Native.—The earliest Romans were a small community of peasant farmers, probably held together in a loose organization with a king at its head. Under him would be the heads (*patres*) of families or clans, with their retainers (*clientes*). Even in its earliest days the community probably engaged in a certain amount of trade in addition to farming and stock raising, since Rome lies advantageously on the principal natural highway of central Italy, which is the Tiber, and on the border between the Etruscan cities northward and the towns of the Latin league farther south. According to tradition the people were of mixed stock, with some Latin and some Sabine highland blood; various linguistic and other facts tend to confirm this. Threatened by powerful neighbours, they were of necessity warlike.

Like many peoples at a comparable or even at a lower stage of culture, the Romans had developed a few "high gods" by the earliest known period of their history. The names of some of their deities can be recovered, chiefly from surviving festival calendars. None of these was composed earlier than the 1st century B.C., and by that late date many of the oldest feast days and religious seasons had lost their former prominence; but the calendars nevertheless record the gods' names in large letters. Chief among them comes Jupiter (in Latin, Iuppiter), whose name is etymologically equivalent to the Greek Zeus and the Sanskrit Dyaus. It must therefore have come down from immemorial antiquity in the Indo-European family, along with the Latin language. The name Jupiter includes also the stock title *pater; i.e.,* head of the house, hence, person in authority. (Neither *pater* nor its correlative *mater* had originally any physiological meaning.) Like Zeus and Dyaus, Jupiter was a sky- and weather-god, obviously important to farmers. With him were early associated two other gods, Mars and Quirinus. Mars was a deity of great importance, widely worshiped in Italy, but of doubtful origins—his name is of highly uncertain etymology. His functions were very wide, and included the protection of his worshipers, their cattle and other possessions against all manner of evils, such as disease or the devastation of their property. These evils included the perils of war, and Mars was consequently a warlike god. Quirinus, whose name is plainly adjectival, was much less

important. He is said to have been Sabine, despite the fact that the sound represented by *qu-* did not exist in the Sabine dialect, and it seems that he was the god of the *quirium*, whatever that may have been. The word would seem to be connected with the name *Quirites* by which Roman citizens were collectively known. Jupiter, Mars and Quirinus formed a triad, but their festivals were separate. Jupiter was worshiped especially on the ides (day of full moon) of each lunar month. Mars was worshiped almost exclusively in his own month, the first of the original Roman year, *Martius* (*i.e.*, March), and in October. Quirinus' feast day was the Quirinalia on Feb. 17.

At least one goddess, Juno, was important in the earliest-known times. She seems to have had no original connection with Jupiter or with any other god save perhaps Janus, one of whose titles was Iunonius. Juno's name may most reasonably be associated with words denoting young maturity, such as *iuuenis*, and so may signify a marriageable woman. Certainly her chief function was to supervise the life of women, and since their sexual life has what may be called a lunar rhythm, Juno has certain lunar associations, under the title of Iuno Couella. The month of June (*Iunius*) is hers, though its name is derived from a stem, *iuni-*, seen in the Etruscan corruption of her name, which is Uni. Her festival, marked by curious and obviously ancient ritual, was the Nonae Caprotinae, or Nones of the Wild Fig, on July 7. A sacrifice was made to her, together with Janus, on the first day (*kalendae*) of every month. On March 1, the dedication day of the temple of Juno Lucina, the birth-goddess, married women held a festival, the Matronalia. This, however, is not one of the oldest holy days. The women swore an oath by this goddess, "Eiuno." There are several examples, too, of a woman speaking of "my Juno," as a man would speak of his "Genius." It has been suggested that there were to begin with many *iunones*, one for each woman, and that the goddess originated from the coalescence of these into the single great figure. But the evidence for an individual *iuno* is late, not earlier than the time of Augustus; while examples of a divine name coupled with a possessive pronoun are fairly common. The locution means no more than, for example: "Such-and-such a divinity, whom I worship"; "this deity in his or her dealings with me." Juno was widely worshiped outside Rome, being sometimes the chief deity of a state, and as such on occasion having warlike functions. Thus at Lanuvium, Juno Sospita Mater Regina was represented clad in a goatskin and bearing a spear and shield.

But the most characteristic deities of this period were vague figures of limited and sharply defined functions. Like the greater gods, they were regarded as possessing superhuman power, known as *numen* from at least the 2nd century B.C. This they could be induced to employ for the benefit of their worshipers if rightly approached. Beyond this, Roman curiosity did not go; the gods have no myths, do not form married pairs (though a masculine and a feminine name are often conjoined) and have no offspring. To name them correctly and to worship them with the proper words and gestures were supremely important; hence there grew up in time elaborate lists of liturgical formulas, the *indigitamenta* (*indigitare* means to address a deity with the appropriate titles, etc.). These are complicated by the intrusion into surviving documents of a host of names of godlings presiding over the most minute details of human life and activity. Some of the names were apparently invented for special occasions, others are due to false etymologies. These numerous godlings appear to be the result of priestly elaboration at a comparatively late period; but it seems true that some such *di minuti* did exist. Thus Janus, who was on his way to develop into a god of beginnings (hence the name, January, of the first month in the reformed calendar and the sacrifice to Janus on all kalends), is almost certain to have been nothing more originally than the personification of an *ianus* or gateway, to pass through which is an act often of magico-religious significance. Vesta, the hearth-goddess, is the sacred hearth itself, the recipient of some cult in every household. Terra or Tellus Mater, the earth-goddess, probably was the holder of that *numen* which was necessary to make the Roman territory productive; certainly she was not goddess of the whole earth. The name of Ceres, the grain-goddess, may have been an adjective, "productive," applied to Terra; she owes her whole personality to her early identification with Demeter. A curious deity is the Genius, a sort of divine double of a man. The name means "begetter," and the Genius was supposed to be pleased if the man was well fed, defrauded if he lived poorly. In classical times every man, bond or free, had a Genius, but it may be that he belonged originally to the head of the house only. Various of these deities form groups. Such are the Indigetes and the Novensides, whose functions remain uncertain; the Lares, originally little gods of the farmland and of the houses standing on it, though their office was enlarged later; and the Penates (singular *penas*), who have an adjectival name, "of the inner rooms," and who particularly looked after the storeroom.

The cults of these and numerous other divinities were regulated in historical times by an elaborate priesthood, which was doubtless much simpler in earlier days. At its head, and including its most important members, stood the college of pontiffs (*pontifices*, or bridgebuilders; *see* PONTIFEX). There were originally three pontiffs proper; they were increased to 16 under Julius Caesar. The college included also the *rex sacrorum* or king of the sacred rites, originally the actual king, but under the republic an official appointed for life to perform the king's sacral duties. In addition there were 15 *flamines* (*see* FLAMEN) or priests of individual gods, the 3 chief (*maiores*) being those of Jupiter, Mars, and Quirinus (*flamines Dialis, Martialis, Quirinalis*). Lastly came the Vestal Virgins, who tended the *Vesta publica*, or state hearth, in the forum. There were normally six of these; they were girls of patrician families, successors of the king's daughters or their substitutes, and chosen in childhood to serve for 30 years (originally for five; *i.e.*, until puberty). All other priests were men, at first patricians—*i.e.*, full citizens. This requisite remained in force for a few posts even after the attainment of equal political rights by the plebeians. Hence Ceres, though a goddess, was served by a man (the *flamen Cerialis*), a thing abnormal to ancient ideas in general. There was no priestly caste like that of the Indian Brahmins. Most of the priesthoods could be held along with a secular magistracy, although the elaborate taboos which the *flamen Dialis* was obliged to observe made this almost impossible in his case, and the *rex sacrorum* was excluded from other posts. The head of the whole body was the chief pontiff (*pontifex maximus*), who exercised disciplinary functions and formally appointed each new vestal and *flamen Dialis*. Outside their purely sacral duties, the priesthood had advisory (not executive) powers.

Outside the college of pontiffs stood the augurs (*q.v.*; *augere*, "to increase"). The derivation of their name implies that they had once been officiants in fertility rites; they were now specialists in divination, particularly from the behaviour of birds. They did not themselves conduct the *auspicia* or taking of omens to ascertain whether the gods favoured a proposed action, for that was the business of every magistrate and could be done even by private citizens on occasion; the augurs were there to advise and direct as needed. There were also several minor bodies. The *Salii* (dancers) performed ceremonial dances, in archaic war equipment, in honour of Mars and Quirinus; the *Luperci* ran naked, save for a girdle of goatskin, around the boundary of the original Palatine settlement every year on Feb. 15 (the Lupercalia; *q.v.*), striking everyone whom they met with thongs of goatskin. They were popularly known as he-goats (*creppi*). Yet other bodies included the Arval Brothers (*q.v.*), who were concerned with agricultural ceremonial of a very archaic type.

It is clear that not all these rites were of the same date. For instance, very ancient custom decreed that the *flamen Dialis* might not touch iron, his hair and nails being cut with a bronze implement. There is evidence that the customs of the vestals were less ancient; their goddess had her seat in the forum, outside the oldest settlement, and they regularly used an iron tool in the preparation of the salt needed for their ritual. The antiquity of some of the rites is evidenced by their not being directed to any deity. The performance of the *Luperci*, in particular, seems to have been purely magical; they drew a kind of magic circle around the Palatine, to keep good influences in and bad ones out. The evidence for the connection of the Lupercalia with a god or goddess

is of the feeblest, and is probably the result of ancient speculation. Another piece of magic was the annual ceremonial of the *Argei* (*q.v.*), in which 27 puppets were thrown from the oldest bridge (*Pons sublicius*) into the Tiber. Here may be recognized a primitive function of the "bridgebuilders" (*pontifices*); the river-god, who may feel insulted at the building of a bridge over his stream, is soothed by a pretense that many persons fall from it and are drowned. The reason for the exact number 27 is unknown.

Italian and Etruscan.—The Etruscan dynasty of the Tarquins (latter half of the 6th century B.C.) brought innovations to Rome, although it does not appear that the spirit of the local religion was much influenced. Cult statues were introduced, the worship having previously been conducted without images. Temples of Etruscan type began to appear; at any rate one such temple, that on the Capitol, was planned and nearly completed toward the end of the dynasty. (In Latin the word *templum* does not mean a temple in the accepted modern sense, but a piece of ground set apart and consecrated. This might or might not contain a "holy house"—*aedes sacra*—for the god or his emblem to reside in.) Elaborate funeral rites, such as remained in use for prominent people in historical times, appear also to be Etruscan. The Etruscans made known to the Romans a complicated method of divination by taking omens from the entrails, especially the liver, of a sacrificial victim. The practitioners of this rite (*haruspices; q.v.*) never became Roman priests, however; they remained foreign or foreign-trained experts, consulted on occasion. Etruscan also was a system of divination from lightning, and a reform of the calendar. The primitive Roman calendar had consisted of only ten lunar months, a gap intervening between December ("tenth month") and March. This calendar was now replaced by one of 12 months, obviously meant to begin with January, since that month is named from the festival of Janus occurring in it, presumably at first called Ianuar. The fall of the Tarquins seems to have prevented the full use of the reformed calendar, however, for the year continued to begin with March for several centuries. (Two month-names, *Iunius* and *Aprilis*, witness to the Etruscan influence behind the reform. *Aprilis* cannot be derived, as was anciently supposed by some, from *aperire*, so as to mean "month of opening," but comes from the name of the goddess Aphrodite, corrupted into some such form as *Apru.*) The 12 lunations of the new calendar were about 11½ days short of a solar year. An extra month, called Mercedonius or Intercalaris, was therefore inserted at intervals to make up the difference, but so clumsily that the calendar lost touch more and more with the seasons until Julius Caesar's reform.

During this period (*i.e.*, the end of the regal epoch and the earlier part of the republican), importations of deities from other than purely Etruscan sources took place. The Capitoline cult gave Jupiter as partners Juno and Minerva, the latter not originally a Roman goddess. The grouping is most readily explained by Greek influence coming through Etruria, for the two goddesses were early identified with Hera and Athena, respectively the wife and the daughter of Zeus. Venus, Fortuna and Diana came in during this period from native Italian sources. Very early in the republic, Castor and Pollux were given a temple in the forum, in consequence, according to tradition, of their aid to the Romans at the battle of Lake Regillus (499? B.C.) against the Latin league. (The form Pollux is the Latin corruption of the Greek Polydeuces.) Even among the earliest-known deities are some whose names yield no discoverable Latin etymology, and certain of them are probably Etruscan. Examples are Volcanus, god of destructive fire, at first volcanic fire; Saturnus or Saeturnus, a deity of very uncertain original functions; and Volturnus, apparently a river-god, probably of the Tiber. Almost certainly a very old importation was Hercules. This form of his name is an Italian corruption of the Greek Herakles. His altar stood in the cattle market (*Forum boarium*) near the Palatine, whose traditional boundary swung out to enclose the market. A widely recognized deity, such as Hercules had become, was needed to keep the peace in a market where strangers were dealt with.

Greek (Greco-Roman).—As Rome expanded, its relations with the Greek communities of southern Italy and, later, with Greece itself and with the empires of Alexander's successors became more frequent. As a result, Greek cults made their appearance, being sometimes new importations, sometimes modifications of existing worships brought about by identification of Greek with Roman or other Italian deities. A new importation was the cult of Apollo, which steadily grew in importance; he had no generally accepted Italian equivalent. The oracles of the Sibyl of Cumae, supposedly inspired by him, were acquired at an early date, according to tradition by the elder or the younger Tarquin. They were thereafter consulted on occasion by a new priestly college, the *duouiri sacris faciundis*, whose numbers were gradually increased from the original 2 to 15 or even more. In the hands of these priests lay the general management of all worship conducted otherwise than in native fashion (*i.e.*, worship by the *Graecus ritus*), and their importance grew as more foreign cults made their way into the city. Such cults did not as a rule invade the inner circle of Roman worship, for this lay inside the sacral boundary (*pomerium*) of the city; but they often spread into the inhabited quarters, which rapidly grew beyond the traditional limits. Apollo himself, in his capacity as a divine physician, soon followed the oracles of his inspired prophetess. His first Roman temple is said to have been vowed in 433 B.C. "for the public health," which presumably means on the occasion of a plague; he appears, however, to have had some sort of sacred place (*Apollinar*) earlier than this. Evidence of the latter species of cult is the temple (on the Aventine and thus outside the *pomerium*) of Ceres, Liber and Libera, a triad copied from the Eleusinian worship of Demeter, Kore and Iacchus. Iacchus was commonly identified with Dionysus and hence with Liber, the Italian wine-god and associate of Jupiter. The Aventine temple became the central sanctuary of the Roman plebs. It was dated 493 B.C., having been vowed three years earlier; its style was Etruscan, but its decorations were Greek. With Greek cults came Greek art, at least in the form of statues of deities, and Greek mythology also. This the Romans accepted eagerly and apparently at a fairly early date—for, despite their intense national pride, they were remarkably ready to learn from foreign sources anything that struck them as important.

The Romans also developed a Greek attitude toward their own early history. It was hardly respectable for any important place not to have a founder with high, preferably divine, connections, and for a barbarian city to be thought something better than barbarous it was well for it to produce some evidence of Greek or, failing that, Trojan origins. As a result of this tendency there grew up various highly artificial legends concerning the foundation of Rome, which finally took their most familiar shape in the tale of Romulus and Remus, sons of Mars and descendants of Aeneas of Troy. The sequel of this particular legend stated that Romulus was transformed into the god Quirinus, this despite the fact that native Roman feeling drew a very sharp line between men and gods. Roman cult had nothing corresponding to Greek hero worship. This embellishment, however, is not known to have been current before the age of Cicero. A landmark in the hellenization of Rome is the *lectisternium* (*q.v.*), a sort of banquet at which the gods were guests, which was held in 217 B.C. Such a banquet in itself was nothing new, but the old manner was to have the gods invisibly present, their attendance at the couches (*puluinaria*) prepared for them being denoted merely by bunches of herbs known as "gods' heads" (*capita deorum*). On this occasion, however, moved by their ill success in the early battles against Hannibal, the Romans resorted to a number of measures intended to secure divine favour. At the *lectisternium* of 217 the gods were represented by their statues and paired in a manner wholly Greek—Jupiter with Juno, Neptunus the water-god with Minerva, Mars with Venus, Apollo with Diana, Volcanus with Vesta, Mercurius, the traders' god, with Ceres. These, in fact, were Zeus with his consort Hera; Poseidon with Athena (a union of the two most characteristic Athenian cults); Ares with his love Aphrodite; Apollo and his sister Artemis; the two powers of fire, Hephaestus and Hestia; and the two deities most concerned with trade, for grain was a very important article of commerce. Together, therefore, the figures at the *lectisternium* made up the typical and popular Greek group of the 12 gods.

Greek myths seem to have had a remarkable effect on a people formerly piously incurious about the gods' character and activities except insofar as these concerned their worshipers. This effect was felt at a time when serious belief in the gods was at least greatly weakened among the Greeks themselves, and when they had a tendency to explain the traditional tales away or to use them merely as literary ornaments with the divine characters strongly humanized. The Romans, however, do not seem to have been greatly scandalized either by such plays as Plautus' *Amphitruo,* in which Jupiter and Mercurius appear as comic figures, or by Ennius' introduction of Euhemerus (*q.v.*), according to whom the gods were not gods at all, but deified kings and other notabilities. Such manifestations marked a stage toward the weakening of the traditional reverent attitude, and this by the last century of the republic had led to widespread indifference or skepticism. Yet, through their native conservatism, the Romans kept up all or most of the traditional observances, even when they had ceased to have any meaning or were at best a subject for learned speculation.

The age of Augustus saw a revival of the old cults, fostered and sponsored by his government and reinforced by new splendour of temples. An addition was the development of the worship of the emperor's patron, Apollo. His great temple on the Palatine became the centre of what might not unjustly be called a rival system to that headed by the Capitolian triad. Whatever Augustus' own beliefs may have been, and however much he may have regarded his religious revival as a useful political instrument, it was the beginning of something resembling an age of faith.

Oriental.—Although the Roman and the Greco-Roman modes of worship were as a rule decent and originally expressed genuine religious feeling, neither was exciting. Moreover, they were state or family cults concerned with this world, little attention being paid to aspirations for a future life. A dead Roman was thought to join the company of the Good People (*Manes,* a word that has no singular). As a member of a family or of a clan he would be one of the *di parentes*—again, no singular form of this description is known until at earliest the latter part of the 2nd century B.C.—and as such he would share in the respectful attentions of the surviving kin. But little hope was entertained of any effective survival for him, though it was trusted that the memory of a distinguished person would be long kept alive.

During the later years of the republic, however, and still more under the empire, a strong but mostly inarticulate demand for some kind of personal religion was growing. There grew up, chiefly in the east, sundry cults that promised their votaries the personal favour of deities, or even divine rank, if certain conditions were fulfilled. These usually included some form of initiation. The orient first obtained a foothold in Rome in 204 B.C., when by advice of the Sibylline oracles the Great Mother of the Gods (*q.v.; Mater deum magna Idaea*) was imported from Pessinus in Asia Minor and in 191 B.C. given a temple on the Palatine, in the heart of Rome itself. Her rites, carried out by eunuch-priests, shocked Roman sentiment, and citizens were long forbidden to take part in them; but the goddess was treated with respect, especially as she was associated with Troy and with the legendary ancestry of the Roman people. In 186 B.C. came the affair of the Bacchanalia (*q.v.*). A cult of Dionysus was introduced into Italy, comprising rites of initiation and nightly ceremonies that had something of the wildness of the god's original Thracian or Thraco-Phrygian worship. They were alleged to be attended by all manner of sexual and other crimes. Scenting a conspiracy against law and order, the senate took severe and effective measures to suppress the movement, but it was the precursor of numerous Dionysiac mysteries, apparently harmless enough, and varying from serious religious associations to dining and drinking clubs nominally under the patronage of the god. These last characterized the early empire especially. The older mysteries, especially the Eleusinian, retained their prestige and drew many Roman initiates, who seem to have read into them whatever philosophical doctrines they found attractive; but the most marked tendencies of the age were definitely toward the east, to Asia or to Egypt.

Astrology gained ground rapidly from about the age of Augustus, and its rigid determinism dismayed many, who sought refuge in anything that would enlist the power of the gods in their favour. (The gods were supposed to live beyond the stars, and so to be free from their centripetal influence.) Some people used elaborate magical practices of a kind supposed to bring the practitioner into contact with deities, and particularly those of theurgy (*theourgia*), a term literally meaning "god-working." But the most characteristic feature of this age (the last century B.C. to the end of paganism) was the multiplying of mystery cults. These generally had for their central feature the adventures, often including death, of a god with whom the initiates were brought into contact, being even perhaps identified with him, so that they passed through some simulacrum of his sufferings and shared his triumph. There were three principal mysteries. First came those of Isis, which although ultimately of genuine Egyptian origin, had been considerably hellenized in passing to the west. Their language was Greek, and they contained several elements not really Egyptian. Then there were the mysteries of Attis, which were an offshoot of the cult of the Great Mother. Attis, the goddess' young favourite, who had died and been at least partly revived, was their central figure. Lastly came the mysteries of Mithra (*see* MITHRAISM). They were in some ways the most important of all, and were originally Persian. The worship was for men only, and was popular especially in the army. It centred on the mythical career of Mithra, was divided into grades vaguely reminiscent of those of freemasonry, and carried with it a high and stern morality. It was for a while a formidable rival to Christianity.

Solar worship was very characteristic of the later imperial epoch. Certain Syrian cults, either originally solar or later held to be so, were partly responsible for this. Perhaps more important, however, was the conception that to the emperor corresponded the greatest of the visible heavenly bodies. The emperor was lord on earth, with power now grown absolute and having many features of that of an oriental despot, while the sun was lord in the sky. There was even a kind of solar monotheism, for a strong tendency existed to explain all other gods as equivalent to the sun. On occasion, the sun cult provided a sort of bridge to or compromise with Christianity, through the identification of the sun-god with the Sun of Righteousness (Mal. iv, 2).

Such was the religious world within which Christianity grew up, and over which it finally triumphed. Constantine the Great recognized Christianity (313) and Theodosius I in 391 and 393 forbade all pagan cult, public or private.

ROMANS, EPISTLE TO THE, the first and probably the most influential in the collection of letters by Paul the apostle in the New Testament. The epistle is addressed to the Christian congregation in Rome, a city Paul is intending to visit for the first time; he is thus introducing himself to a congregation he does not yet know personally. This is especially necessary as he intends to go on from Rome to Spain and hopes to be helped in this enterprise by the Roman Christians (Rom. 15:23–24). As he therefore has to tell the Romans who he is and what he stands for, he gives in this letter a fuller and more systematic account of his ideas and purpose than he does in any of his others. First and foremost, however, it is a genuine letter, written only for its first readers in Rome. This combination of personal address with gen-

eral arguments makes the interpretation of the epistle at the same time both attractive and difficult.

Contents.—The Epistle to the Romans may be outlined as follows:

1:1–7	greeting
1:8–17	Paul's plans to preach the gospel in Rome
1:18–4:25	believers are saved by faith, not by obedience to the Law, just as Abraham was
5:1–6:23	believers thus reconciled to God are freed from sin
7:1–8:34	having passed from the power of the Law they should now live in the spirit of God
8:35–39	nothing can separate them from the love of God
9:1–10:21	the Jews, who do not believe in Christ, seem to have been rejected by God
11:1–36	but God's purpose for them too is salvation in the end; after all, the gentiles have been saved
12:1–13:14	moral exhortations
14:1–15:13	how to deal with the scruples of the "weaker brethren"
15:14–33	Paul's plans to visit Jerusalem and Rome
16:1–23	recommendation of Phoebe, and various personal greetings
16:25–27	doxology

The sentence of greeting at the beginning (1:1–7), which is much longer than in Paul's other epistles, shows that the purpose of the letter is to stress Paul's apostleship and to detail the content of the gospel he has to preach. And in the introduction he at once mentions his intention of visiting Rome and preaching the gospel there too (1:8–15). In so doing he formulates the essence of this gospel: "in it the righteousness of God is revealed through faith for faith" (1:17), thus announcing the theme that is treated in the main part of the epistle (1:18–11:36). As no man, whether Jew or gentile, can on his own be righteous before God (1:18–3:20), it is good news to proclaim that God has now revealed his righteousness by the death of Jesus Christ, which atoned for men's sins so that those who believe may be saved without performing the works of the Law (3:21–31).

This new dispensation of God's grace is in reality an old one, for Abraham too was saved by faith (ch. 4). Paul goes on to show that God's saving action in Christ has already reconciled the believer who has been declared righteous by faith, so that he can be as sure of final salvation as man has been certain of death since the fall of Adam (ch. 5). But as Paul knows that this message can lead people to licentious behaviour he passionately avers that every believer who has been baptized and has died in this way with Christ has been given a new life and should therefore not continue to sin; Paul is clear that for the believer, too, "the wages of sin is death" (ch. 6). The believer, who has been freed from bondage to the Law and is therefore no longer compelled to sin, can by the help of the Spirit of God given to him do God's will and be confident that nothing whatever "will be able to separate us from the love of God in Christ Jesus our Lord" (ch. 7–8). The hymn at the end of this argument (8:35–39) shows that Paul feels he has brought to a conclusion the theme stated in the introduction (1:16–17).

One problem, however, remains: Why did the Jews, God's chosen people since Abraham, fail to believe the gospel that proclaims God's power for salvation "to every one who has faith, to the Jew first and also to the Greek" (1:16)? Paul—who, as a Jew, is personally concerned—tries to show that there is a secret purpose of God in this failure of the Jews. Certainly God, as God, has the right to reject even his chosen people, and certainly the Jews should have been able to believe that they had no exclusive rights to salvation, for the Old Testament itself teaches that God's message is for all men (ch. 9–10). God, however, certainly has not rejected his chosen people, but by the extension of faith to the gentiles he intends to incite the Jews also to believe in the new dispensation: "a hardening has come upon part of Israel, until the full number of the Gentiles come in, and so all Israel will be saved" (11:1–32). The idea of this universal saving intention of God induces Paul to end the whole argument with a hymn of praise to God's unsearchable ways (11:33–36).

Yet Paul does not limit himself to a demonstration of God's saving act and purpose but goes on to show how this salvation affects the everyday life of the Christian. The last five chapters of the epistle, composed of general exhortations combined with the special instruction to live in subordination to secular authority, are throughout inspired by the duty of presenting one's body to God as a living sacrifice and by the urgency of a belief that the end of the world is imminent (ch. 12–13). It is uncertain whether any of these exhortations arise from knowledge of life in the Roman congregation, but the advice which follows about dealing with the "weak" members (*i.e.*, the vegetarians) is undoubtedly directed to a specific situation (ch. 14–15). The epistle continues with information about Paul's plans to go via Jerusalem and Rome to Spain and his fears of the "unbelievers in Judea" (15:14–33). Then the letter ends with a recommendation of the deaconess Phoebe of Cenchreae, with greetings to numerous people, with a somewhat unexpected warning against "those who create dissensions," and finally with greetings from some of Paul's friends, including "Tertius, the writer of this letter" (16:1–23; *i.e.*, the amanuensis). The concluding doxology (16:25–27) is longer and more elaborate than those in Paul's other epistles.

Purpose of the Epistle.—Why did Paul write this unusually long letter to a congregation he did not himself found? It is clear from the introduction, the final chapter, and the exposition of his leading ideas in the main part of the letter that he wants to introduce himself to the Christians of Rome. But he does not merely explain, he also defends the Christian gospel from the misunderstanding that everyone can be righteous by performing "the works of the Law" (3:20). (In so doing, however, he is not attacking any opponents in the Roman congregation.) He insists again and again that the Jew as such is not in an advantageous position before God, but, like the Greek, will be asked only for faith and good deeds (1:16–17; 2:9–10). Yet at the same time Paul warns the Christian converts from paganism not to despise the Jews who do not believe in Christ and not to forget that the Jewish people is the root from which the church has grown. He insists further that the Jewish Law is holy, though it does not lead to life, and that the Christian too is to fulfill the just requirements of the Law, for submission to the gospel of Christ must not lead to a life of sin (7:12; 8:4; 6:1, 12).

It is clear, however, that this polemic is not directed against actual Jewish-Christian opponents (as in Galatians and possibly II Corinthians), for Paul never warns the Roman Christians not to submit themselves to the Law. His words are intended to minimize the attraction of this particular error and to guard against a temptation to which every Christian is prone. But apart from this there seems to be a practical motive for Paul's defense of the Law and his polemic against antinomian consequences drawn from the gospel of grace. (*See* ANTINOMIANISM.) Paul probably knew of an antinomian tendency in the Roman church, composed as it was chiefly of converts from paganism, and he was certainly aware of the tension between scrupulous Christians who, possibly influenced by some form of pagan asceticism, wished to abstain from meat, and those who are convinced, like Paul himself, that a Christian may eat anything. This knowledge that Paul has of the difficulties and dangers threatening the Roman church motivate his writing to them, for he feels bound, as the "apostle to the Gentiles" (11:13), to help and advise all gentile Christians, including those who do not owe their faith to his own mission work.

Date and Place of Origin.—The date and place of origin of the Epistle to the Romans cannot be precisely determined. Paul thinks he has finished his work in the eastern Mediterranean area and intends to go to Rome and Spain, after bringing the collection of the Greek Christian congregations to the poor of the church of Jerusalem (15:23–26). This corresponds to the situation at the end of his so-called third missionary journey (Acts 20), and there is thus general agreement that Paul wrote the Epistle to the Romans at this period of his life, in the spring of A.D. 57.

The question where the epistle was written is more difficult. As Paul spent some time in Corinth at the end of his third so-called missionary journey (Acts 20:2 ff.) and as he recommends the deaconess Phoebe of Cenchreae, the harbour of Corinth (Rom. 16:1), it is a plausible suggestion that the epistle was written in Corinth. No convincing evidence can be brought against this theory, which is therefore generally accepted. It could, however,

have been written elsewhere, for instance at Philippi, as T. M. Taylor proposes, on Paul's way to Jerusalem some months later.

Authenticity.—It is generally agreed among scholars that the first 15 chapters of the Epistle to the Romans were written by the apostle Paul. The language is Pauline, and the central ideas correspond so closely in detail to those of the other Pauline Epistles, especially Galatians, that no doubt on this point is possible. Further, the sequence of the long argument (ch. 1–11), followed by a paraenetic section (12–15:13) and then Paul's personal plans concluding the epistle (15:14–33), corresponds to I Thessalonians, Philippians, and Colossians. The final chapter, however, must be discussed separately.

The Doxology.—Not all manuscripts place the doxology at the end of ch. 16. In the oldest (3rd century) papyrus of the Pauline Epistles it comes after the end of ch. 15. In most of the oldest manuscripts, it appears at the end of ch. 16 (but the Codex Alexandrinus and a 9th-century manuscript insert it after ch. 14 as well). Many later manuscripts place it after ch. 4, whereas one important manuscript of the 9th century leaves it out altogether. The canon of the heretic Marcion omits both it and the whole of ch. 15 and 16. These variants in the manuscript tradition cannot be satisfactorily explained if the doxology originally stood at the end of the letter.

Further, the doxology states that the mystery of the gospel has been kept secret since eternal ages and mentions Christian prophetic writings—both notions being incompatible with Pauline theology but in full agreement with Marcionite ideas (*see* MARCION; MARCIONITES). It therefore looks as if the doxology had been coined in Marcionite circles and then attached to the Pauline epistle. If this hypothesis is true, as seems likely, the doxology was not written by Paul nor was it part of the Epistle to the Romans as accepted in the oldest collection of the Pauline Epistles. The grace (16:24: "The grace of our Lord Jesus Christ be with you all") is missing in the best manuscripts and consequently in many modern translations. It must have been added originally to a copy of the epistle that did not yet have the doxology.

The Rest of Chapter 16.—Neither content nor manuscript tradition has led scholars to doubt the authenticity of the rest of ch. 16, but many have accepted the hypothesis that it originally formed a separate letter (addressed probably to the church at Ephesus) which was combined with the Epistle to the Romans when the first collection of the Pauline Epistles was made. The following arguments are usually brought forward to support this theory: (1) Paul does not send greetings to so many people in any other letter. (2) As he knows many of them personally they must have moved from the east to Rome: Aquila and Prisca lived in Ephesus after leaving Corinth with Paul (Acts 18:18–19; I Cor. 16:19), yet they are now in Rome (Rom. 16:3), while Epaenetus, "the first convert in Asia for Christ," who might also be assumed to be in Ephesus, is now also in Rome (Rom. 16:5). (3) The unexpected attack on those who create dissensions and scandals, who do not serve Christ but their bellies, fits in much better with the strictures that Paul made against the Galatians and Corinthians, when he wrote to them from Ephesus, than with the situation in Rome, since the rest of the epistle gives no indication that such heretics are to be found there.

These arguments, however, are not convincing. The great number of greetings is explained by the fact that Paul wants to show friendliness to the congregation of a place he has not yet visited, and a parallel is to be found in Col. 4:10–17. There was always a strong migration from the east to the capital; Prisca and Aquila were Roman Jews driven out when the emperor Claudius ordered all Jews to leave Rome (Acts 18:2), but they could have returned after Claudius' death (A.D. 54). The attack in Rom. 16:17–20 could be equally appropriate for the Roman congregation, as one need not suppose that such heretics were at this stage of any real influence in that Roman church.

Further, the suggestion sometimes advanced that this chapter was originally a separate letter, composed chiefly of greetings and a warning, has no evidence in its support and is intrinsically improbable. Neither the theory that this chapter was added to Rom. 1–15 nor T. W. Manson's conjecture that Rom. 1–15 was addressed to the Romans and then, with the addition of ch. 16, to the Ephesians is convincing enough to explain the other difficulties: why the end of the original letter to the Romans was lost and why a letter to the Romans was sent to the Ephesians without changing the address. The most plausible solution is to take the disputed ch. 16 as the original conclusion to Paul's epistle to the Romans.

Influence.—As the Epistle to the Romans provides the fullest and least polemical statement of Paul's message, it is fundamental for the understanding not only of his theology but also of New Testament teaching in general. The interpretation of this epistle was central to the controversies between Augustine and Pelagius, between Luther and Erasmus, and between Karl Barth and Adolf von Harnack. From the early church up to the 20th century, leading theologians—Origen, John Chrysostom, Augustine, Cyril of Alexandria, Pelagius, Theodoret of Cyrrhus, Thomas Aquinas, the Reformers, Karl Barth, Emil Brunner, and A. Nygren—have written commentaries on it. Luther discovered afresh the primitive gospel message while lecturing on Romans (1515–16), John Wesley found certainty of personal salvation through listening to Luther's preface to Romans, and Barth, by a fresh and subjective interpretation of Romans, initiated a new orientation of Protestant theology in Europe. Roman Catholics and Protestants have come closer to each other than formerly in the interpretation of the New Testament, but it is precisely in the Epistle to the Romans that the remaining differences are most clearly apparent. For this epistle gives the most detailed as well as the most difficult statement on the central problems of Christian theology, such as salvation by faith, the importance of the works of the believer for salvation, and the meaning of baptism, election by God, and the work of the Holy Spirit. *See* also BIBLE; PAUL, SAINT.

ROMANSH: *see* RAETO-ROMANCE DIALECTS.

ROMANTICISM, a term loosely used in both a historical and an aesthetic sense to designate the numerous changes in literature and the arts during a period of more than 100 years (roughly, 1760–1870), in reaction against neo-Classicism (but not necessarily the classicism of Greece and Rome), or against what is variously called the Age of Reason, the Augustan Age, the Enlightenment, and 18th-century materialism.

Historical.—Major changes in the arts (unless begun by one person of genius) are usually related to some social upheaval, or to changes in the philosophical concept of man which may precede, accompany, or follow it. Thus, historians often identify the rise of Romanticism with the Industrial Revolution, or with the American War of Independence and the French Revolution, both of which produced significant Declarations of the Rights of Man. Attention must first be given, however, to pre-Romanticism, which anticipated these events. This term refers (among other things) to the so-called Rousseauistic stream of sensibility which accompanied the declining neo-Classicism of the 18th century, already weakened by the quarrel between the Ancients and the Moderns (*see* ANCIENS ET DES MODERNES, QUERELLE DES). Rousseau's

assertion of man's natural goodness, social equality, and the social contract, together with the sentimental idealism of his *La Nouvelle Héloïse* and the vague religiosity and "natural religion" of the *Rêveries* and the "Vicaire Savoyard," and the portrait of a split personality in the *Confessions,* disturbed orthodox religion and political, moral, and mental philosophy. His largely anarchistic influence was accompanied, accidentally, by the constructive but equally liberating impact of the so-called Shakespearean explosion beginning in the 1760s with Jean François Ducis, Pierre Letourneur, Herder, and the *Sturm und Drang* movement.

Other influential, though minor, pre-Romantic figures were Edward Young, James Thomson, James Macpherson, Salomon Gessner, and J. G. Hamann, all of whom developed in poetry that picturesque element which in landscape gardening and painting was being explored by William Gilpin, David Cox, Ramond de Carbonnières, Giambattista Piranesi, George Morland, Hubert Robert, and William Shenstone, a landscape gardener, poet, and arbiter of taste. Pre-Romanticism in the novel is represented by Samuel Richardson, Marivaux, the abbé Prévost, Rousseau, Diderot, Horace Walpole, Beckford, Bernardin de St.-Pierre, Goethe's *Werther* (1774), and the marquis de Sade. Other important precursors were Thomas Paine, Niemcewicz, Alfieri, and Burns; but the great hinges between neo-Classicism and Romanticism were Goethe, André Chénier, Blake, Schiller, Coleridge, Wordsworth, and Chateaubriand.

Romanticism proper was, as Mme de Staël suggested in *De la Littérature* (1800) and *De l'Allemagne* (1810, 1813), largely of northern origin, but nobody followed her in setting "Nordic" literatures above those of Greece and Rome. The French Revolution, by shaking feudalism throughout Europe, hastened the decline of patronage and resulted in the liberty, poverty, and Bohemianism of the artist. It started the elaboration of theories of Utopian Socialism from Babeuf to Marx, at the same time stimulating Feminism (Condorcet, Mary Wollstonecraft Godwin, Olympe de Gouges, Jeremy Bentham). Liberating the message of de Sade, it strengthened a complex erotic literature running from the Gothic or Black novel (the *roman noir*) to Surrealism. However, the influence of the French Revolution was not felt immediately in all the arts, nor at the same time in all countries: France itself had what has been called "a revolutionary literature but not a literary revolution." But the generation of Chateaubriand, Goethe, Blake, Coleridge, and Wordsworth was profoundly disturbed by it.

The second phase of Romanticism was stimulated by the Napoleonic Wars. Napoleon's legend contributed to the image of the Romantic hero: even in real life many writers (Chateaubriand, Byron, Lamartine, Vigny, Musset, Hugo, Pushkin) adopted the attitude of Olympians or fallen angels, a pose which lasted down to Oscar Wilde and D'Annunzio. But the most important result of the Revolutionary and Napoleonic Wars together was the quickening of nationalism, marked by a return to local origins: the collection and imitation of folklore, folk dance, and music, and of medieval and Renaissance works. This passed beyond a revival of themes and forms into a rebirth of the use of inhibited languages (Tuscan, Flemish, Erse, Welsh, Breton, Provençal, Czech, Magyar) in literature. National scholarship prepared the way for imaginative writing: the historical fictions in prose and verse by Scott, Southey, Hugo, Mickiewicz, Niemcewicz, Pushkin, and Manzoni were the flowering of a scholarly trend begun 30 years earlier. Long-neglected writers and works—Dante, Chaucer, Villon, Chrétien de Troyes, Sir Thomas Malory, the *chansons de geste,* the *Nibelungenlied,* the *Mabinogion,* the *Pléiade,* Spenser—were restored to honour. Scholarship also underlay the ballad poetry produced in Britain, Germany, Hungary, Poland, Rumania, Belgium, Bulgaria, and elsewhere.

But the medieval revival had undesirable side effects, tainting poetry, painting, and architecture with bogus archaism or anachronism throughout the 19th century. Perhaps the most important result of the folk revival was the stress laid on the supernatural. The folk supernatural of romance and balladry branched off into gratuitous hair-raising in, for instance, Mary Shelley's *Frankenstein* (1818), C. R. Maturin's *Melmoth the Wanderer* (1820), and the work of Charles Nodier, Achim von Arnim, and Edgar Allan Poe; and into metaphysics with Goethe's *Faust* and the work of Novalis, Hölderlin, E. T. A. Hoffmann, and Gérard de Nerval. A splintering, too, is seen in Scott's influence. The Waverley Novels began to appear in 1814, but it was long before imitation came from Manzoni, Hugo, Balzac, Dumas, Jacob van Lennep, Bernhard Severin Ingemann, Angel de Rivas, and Mariano Larra. After this the Waverley Novels were adapted first as plays and later as operas. Scott's manner also influenced the writing of history (Carlyle, Michelet, Lamartine, Vincenzo Cuoco), before the positivist reaction set in, and was the source of "romanced" biography from Vigny (*Stello,* 1832), Carlyle, Théophile Gautier (*Les Grotesques,* 1834–36), to the mid-20th century.

A third Romantic wave may be dated from about 1830, with the changes of political regime in Greece, Belgium, and France; the Polish and Italian risings; and the English Reform Bill (1832). This third movement mainly consolidated the tendencies already referred to; but it also saw the beginning of Romantic Realism in the theatre and the novel and a closer identification between Romanticism and political liberalism and socialism. Romanticism gradually declined after 1848 into frantic protest or sheer lassitude, finding no alternative "classical" stand, except in the French Parnasse, but rather the aestheticism of the Pre-Raphaelites and "art for art's sake," sentimental Naturalism, or a final neo-Romantic expression in such European movements as Symbolism, Impressionism, Futurism, Imagism, etc.

Historically, therefore, Romanticism can be seen to be neither a school nor a movement but rather a period of restless experiment (except in local cases such as the short-lived Cénacle, in France; *see* FRENCH LITERATURE: *The Second Period: 1815–1848*). But the spirit of the age was so strong that certain literatures which then took shape (those of the United States, Czechoslovakia, Belgium, Provence, and Ireland, for instance) have remained basically "Romantic." Some important writers (*e.g.,* Jane Austen, Leopardi) remained aloof from the Romantic influence. Historically Romanticism represents no single tendency but rather the simultaneous pressure of many different, often conflicting, principles and aspirations in a stage of European history which is not yet over. One serious historical and critical difficulty is that in most European countries several generations were involved. The term would be historically questionable if we accepted, for instance, Sir Herbert Grierson's three "Romantic ages" (Plato, etc.; 12th- and 13th-century "romance"; modern Romanticism; see *Bibliography*).

Aesthetic.—Aesthetic objections to the use of Romanticism as a critical term are even stronger. In the arts there is no common Romantic style to be compared with, for example, Heinrich Wölfflin's definition of a Classical and a Baroque style (*see* BAROQUE ART). Is there, in fact, any common denominator between the poets, musicians, painters, and novelists of the time, apart from secondary characteristics deriving from the historical moment? Local and personal variations of Romanticism were so great (and often so extreme) that no critical theory can be based on the word. Goethe set the example of pejorative definition by identifying Classicism with health and Romanticism with sickness, but most "Romantics" did not know what they were: Hugo identified Romanticism with liberalism and revolt; Delacroix with a metaphysical interpretation of the world; Blake with "Imagination, the Divine Vision"; Berlioz with heroicism and expressionism; Gautier with youth; Nerval and Hölderlin with Dream; Musset with the *mal du siècle,* or disenchantment; Herder with Magic; Schlegel with yearning or nostalgia (*Sehnsucht*); Baudelaire with "a manner of feeling"; Coleridge with Imagination and Wordsworth with Illumination, or intuition (though the last two were not thinking specifically of Romanticism). The dichotomy of the *Lyrical Ballads,* straining at once toward both a popular common-speech poetry and the supernatural and a calculated poetic diction, is typical of the Romantic dilemma: Romantic art was weakened by a striving toward a superhuman totality beyond any individual's powers and resulted, paradoxically, in excessive fragmentation.

Hegel, in describing what he called Symbolic, Classical, and Romantic forms of art, appears (according to his dialectic) to confer

the highest status on the third (as Synthesis) and to associate Romanticism with Transcendental Idealism by stressing the Inwardness (*Innerlichkeit*) of Romantic art: "The world of Inwardness celebrates its triumph over the outer world." This helps to pinpoint the essential subjectiveness of Romantic art, with its emphasis on the inspired or privileged visionary or seer; autoanalysis and introspection; the self-display of the Byronic stream; the revelation theories which abounded from Novalis to Rimbaud, Mallarmé, and Rilke; the extraordinary value given to Dream, particularly by German and French writers, leading to an overvaluation of the unconscious and the irrational. Generally speaking the writers and artists of the Romantic period—*i.e.*, the 19th century—took subjectivism to the point of almost ridiculous personal vanity, which they undermined by what Irving Babbitt called "romantic irony" or self-denigration. This could only come of uncertainty about the nature of man, religion, and art. The Germans from Herder onward emphasized feeling and imagination in arbitrary opposition to logic and reason; but such thinking was possible only because the age was dominated by a faculty psychology related even to psychophysiological types by J. C. Lavater, or to "bumps" (*i.e.*, phrenology), by Franz Joseph Gall. Thus Shelley could assert, naïvely, that "Poetry is not subject to the control of the active powers of the mind, and its birth and recurrence have in no way connection with the consciousness or will." This is contradicted, however, by the fact that works of any length (*e.g.*, Goethe's *Faust*, Wordsworth's *The Prelude*) are not casual effusions or visitations (like Coleridge's *Kubla Khan*) but involve a complex mental and physical effort, sometimes over a period of years. Coleridge's failure to finish *Kubla Khan* was not a failure of will, reason, or imagination, but a failure to accept the Classical creative technique, by which inspiration is prolonged by invention (*i.e.*, sustained imitation of a given intuitive experience).

This Romantic suspicion of will, reason, knowledge, and tradition is also reflected in F. W. Schelling, whose notion that "essence always outgrows form" led to Sir Herbert Read's theory of "organic form," this being exalted as Romantic, while geometrical, abstract, or "mechanical" form would be either Classical, or worthless, or both. This does not mean that the Romantics did not use traditional forms, revolutionizing them, erasing distinctions between the genres, reviving archaic forms and creating new ones, such as the prose poem or the Wagnerian opera. But, organic or not, such anarchic experiment with forms does not constitute a *Style:* it would be more satisfactory to invent the term "Romantic Mannerism" to describe this breakdown of the old rhetoric and the absence of a new one, for the most significant break with neo-Classicism was the rejection of the idea of decorum.

Among other fallacious definitions of Romanticism might be mentioned the efforts of Pierre Lasserre (in his *Le Romantisme français* . . . , 1907, a defense of Classicism against Romanticism) and Babbitt to identify it with decadence; Lascelles Abercrombie's dissociation of it from Realism (as if Balzac, Dickens, and Stendhal, for example, existed in some other literary world); and T. E. Hulme's scorn of it as "spilt religion." Hulme, T. S. Eliot, Benedetto Croce, Charles Maurras, and others, in associating Romanticism with a collapse of religious belief, overlooked the coincidence of the Romantic revival with the upsurge of Methodism and Unitarianism (*qq.v.*), or its first manifestations in France (before its liberal phase) as being both monarchist and Catholic. It is dangerous to isolate the term from its historical context, as Melchiori has done, or to oversimplify as do Brunetière and Grierson in seeing it only as the absence of something else (refusal of the classical synthesis, etc.); or, like Valéry, to regard it only as a disorder which precedes classical order. Mario Praz has identified it with such erotic abnormalities as sadism, masochism, algolagnia (though these have always been present in the arts), but has ignored the Romantic age's aspiration toward truth and beauty and other forms of idealism. He asserts

> there is such a thing as a Romantic Movement and Classicism is only an aspect of it. . . . There is no opposite pole to 'romantic,' merely because 'romantic' indicates a certain state of sensibility which, simply, is different from any other, and not comparable either by co-ordination or by contrast.

The answer to this may be seen in the historical survey above, which shows that much more than a special "state of sensibility" was involved. In the arts it is not possible to deal with states of sensibility alone: the critic, like the artist, is always challenged by the limitations or frontiers of language or plastic means of expression and by the facts of the historical process. Croce, while exaggerating in defining Romanticism as feeling and Classicism as representation, was perhaps right in saying that each term is only a half-truth. Having said that a work is Romantic (other than historically) it still remains to name, in further terms, all the qualities which are supposedly included under that expression. While the term Romanticism may be legitimately used in a historical context, though even then only with numerous qualifications, it is no more satisfactory in criticism or aesthetics than Classical, Baroque, or Symbolist, although they, also, may be used for historical convenience.

(F. Sc.)

ROMANUS (d. 897), pope, succeeded Stephen VI (VII) about August 897 and died a few months later, perhaps in November. Very little is known about his life or his brief pontificate. He was born at Galese, near Civita Castellana and was cardinal-priest of St. Pietro in Vincoli when he became pope. He seems to have been a virtuous man in an era of ecclesiastical degeneracy at Rome. He may have been deposed by one of the quarreling factions in the city.

(D. Ar.)

ROMANUS, the name of four Byzantine emperors.

ROMANUS I LECAPENUS (*c.* 870–948), ruler from 919 to 944, was of Armenian peasant stock. He became a sailor who rose to be first commander of the Samian theme and then admiral (*drungarius*) of the Byzantine navy. Cleverly taking advantage of the mistakes of the dowager empress Zoe, mother of the young Macedonian emperor Constantine VII, he got the better of his rival Leo Phocas and gained control of the government. In 919 his daughter Helena married the emperor and Romanus received the title first of *basileopator* and then of Caesar. In Dec. 920 he was crowned co-emperor and he directed policy until his downfall in

944, while the legitimate ruler Constantine VII remained to some extent in the background.

Romanus' statesmanlike policy effectively countered the ambitions of the Bulgar ruler Simeon who had aimed at controlling Constantinople. On Simeon's death (927) Romanus arranged a marriage alliance between his granddaughter Mary Lecapena and Peter the young Bulgar tsar. In the east, the Byzantine army under the general John Curcuas had considerable success in the Armenian and northern Mesopotamian regions culminating in the capture of Nisibis (943) and Edessa (944). A Russian attack of 941 on the capital was entirely defeated, and a treaty with the Russian leader Prince Igor was effected in 944.

At home Romanus came to terms with the church on the vexed issue of the late emperor Leo VI's fourth marriage, thus winning its valuable support, though after the death of the great patriarch Nicholas Mysticus nonentities held this ecclesiastical office, including Romanus' own son Theophylact (933–956), who was well known for his interest in his stables. One outstanding feature of Romanus' internal policy was his attempt to support the small farmer whose land was often held on condition of military service. His legislation, particularly the laws of 922 and 934, was designed to prevent the powerful landowners from buying out the smallholders. The successful regime of Romanus was tragically terminated by the foolish ambitions of his sons Stephen and Constantine, who had him seized and exiled to the island of Prote in the sea of Marmara where he died a monk on June 15, 948.

Romanus II (938–963), emperor from 959 to 963, the son of the Macedonian Constantine VII Porphyrogenitus, succeeded his father at the age of 21. His first wife was the illegitimate daughter of Hugh of Provence who died young; his second wife was a publican's daughter, the notorious Theophano, who was the mother of his two sons, the future emperors Basil II and Constantine VIII. Romanus himself was a somewhat frivolous young man. At home the eunuch Joseph Bringas took control for him. Abroad, he was fortunate in his general Nicephorus Phocas, who in 961 captured Crete from the Arabs and then victoriously advanced in northern Syria. On March 15, 963, Romanus' early death occurred, and it has been suggested that this was brought about by his wife.

Romanus III Argyrus (*c.* 968–1034), emperor from 1028 to 1034, was of noble family and held the important office of prefect of the city of Constantinople. He was chosen by the dying Macedonian emperor Constantine VIII as husband for his daughter Zoe. On the death of his father-in-law he succeeded to the imperial throne together with his wife on Nov. 15, 1028. He was an ineffective ruler belonging to the civil aristocracy of the capital and he was no match for the powerful military magnates of the provinces. Laws against them were no longer enforced and extravagance and financial relaxations drained the resources built up by Basil II. Romanus himself was not a successful military commander, but the rise of George Maniaces gave the empire an outstanding general whose victories on the eastern frontier were crowned by the capture of Edessa (1032). After his accession Romanus neglected his elderly wife and checked her extravagant whims; this proved his undoing, for she came under the influence of Michael, the younger brother of John the Orphanotrophus, an able palace eunuch of humble Paphlagonian origin. Romanus was found drowned in his bath on April 11, 1034, and it was believed that his wife Zoe had connived at his death.

Romanus IV Diogenes (d. 1072), emperor from 1068 to 1071, was a Cappadocian landowner who had risen to distinction in the army, particularly in his campaigns against the Pechenegs (Patzinaks). After the death of Constantine X Ducas, it was clear that the military situation required an experienced leader, and against the wishes of the civil party in Constantinople the dowager empress Eudocia, whose two sons were minors, married Romanus who was crowned emperor on Jan. 1, 1068. Romanus was faced with depleted resources at home and with serious enemies abroad, particularly the Normans in south Italy and the Turks on the eastern frontier. He made a valiant attempt to revive the neglected Byzantine military defenses and in 1068 and 1069 he carried out successful campaigns against the Seljuks on the eastern frontier. But in Aug. 1071 he was defeated at Manzikert near Lake Van, partly because of the treachery of the troops commanded by Andronicus Ducas, a son of his political opponent, the Caesar John Ducas. Romanus was captured by Alp Arslan, but was well treated, and he succeeded in negotiating a treaty with him.

On his release he discovered that a palace revolution had taken place and his stepson Michael VII Ducas had been declared sole ruler on Oct. 24 while Eudocia had been dispatched to a nunnery. In violation of a promise of safe-conduct he was blinded, and died of his wounds on the island of Prote in the sea of Marmara in the summer of 1072. It was during this reign that the Byzantines lost their last hold on their Italian provinces by the surrender of Bari to the Normans in 1071.

ROMANY LANGUAGE, the language of the gypsies, is one of the Indo-Aryan languages (*q.v.*), a fact which constitutes the strongest proof that the gypsies originally came from India. Romany is not only derived from the same original source as the other Aryan languages of India, but must for many centuries after the Vedic age have shared their development within or near the borders of India, for in general it shows the phonetic and grammatical changes which the Indian languages as a whole reached not long before the beginning of the Christian era.

Dialectal Position.—The dialect group in which Romany had its origin is a question that has been widely discussed. One school holds that it belongs to the northwestern and especially to the Dardic, which comprises certain dialects of the Hindu Kush and also includes the more important Kashmiri. These languages, in some respects more conservative than those of areas farther in India, have kept certain features of the old Sanskrit sound system unchanged; *e.g.*, the preservation of two or more sibilants (*ś, ṣ, s*) or of an *r* preceded by a consonant. The Romany dialects also show some of these peculiarities, but the preservation by descendants of characteristics that existed in the parent language is not proof that they have any specially close relationship other than common origin. The existence of the same early innovations in both is proffered by those who hold that Romany originally belonged to a more central group of dialects of which a typical modern representative in India is Hindi. It is with these that it shares its earliest sound changes. Romany does not however share other later innovations of the central group which had set in or were setting in at the time of Asoka (*c.* 250 B.C.). They must, therefore, have severed their relations with this group before that date. The word *rom,* "gypsy man," southeast European *rom,* Armenian Ry. *lom,* Palestinian Ry. *dōm,* is the same word as the Skt. *ḍomba,* "a low caste of dancers and singers," from whom the *Ḍōms* of India derive their name. It is probable that wandering tribes, perhaps of the same character as some criminal tribes of modern India and speaking a central dialect, made their way to the northwest (probably western Punjab or Peshawar district) before the middle of the 3rd century B.C. There, among speakers of the northwestern dialect group, they stayed until some time before the 9th century A.D. they left India in a migration which spread them all over western Asia, Europe and even America.

Dialects.—It is not known whether the gypsies left India in one or several separate migrations or whether there were even marked dialectal variations in the language they spoke. But presently there are at least three distinct groups of dialects, Asiatic, Armenian and European. One of the most noticeable differences lies in the treatment of the original voiced aspirates of Sanskrit. The Asiatic dialects have either preserved these or, losing the aspiration, have reduced them to simple voiced sounds; the European and Armenian dialects on the other hand have changed them to surd aspirates: Skt. *bh, dh, gh* became Asiatic *b,d,g,* but Armenian and European *ph,th,kh* (*p', t', k'*). Thus Skt. *bhrâtā* "brother," *dhūmáḥ* "smoke," *ghṛtám* "melted butter" are in Eur. Ry. *p'ral,-t'uv,k'il* and in Pal. Ry. *bar, dif, gir.*

There is considerable dialectal variation even within a single

group such as the European Romany group, dating probably from the time of separation within Europe itself. These dialects differ according to locality and the degree to which they have been influenced by surrounding languages. In this respect they may vary from the comparatively pure Indian idiom of, for example, some of the Balkan gypsies or even the gypsies of Wales, to mere jargons consisting of a framework of the local language, *e.g.*, English, in which a portion of the vocabulary is replaced by Romany words.

Phonology.—The vowel system rests on Sanskrit. As in all Middle Indian dialects, Skt. *ai* and *au* have become *ē* and *ō; e.g.*, Arm. Ry. *tel* "oil" from *tailám; mol* "price" from *maulyam*. In the European dialect, Skt. *a* in an open syllable appears as *e* but in an originally closed syllable as *a*, which is also the representative of Skt. *ā: merel* "dies," *rak'el* "keeps," *manuš* "man," from *márate, rákṣati, mānuṣáḥ*.

In the consonant system, the chief innovation is the change of the voiced aspirates already mentioned. Of the surd aspirates, *ph* appears to remain (*p'al* "board" from Skt. *phálaḥ*); *ch* loses its aspiration in west European Romany (W. Eur. *čin-* "to cut," S.E. Eur. *č'in-* from Skt. *chinná-*); *kh* perhaps becomes a spirant *χ* (*χanro* "sword" from Skt. *khaṇḍakaḥ*). Intervocalic consonants, as in all other descendants of Sanskrit, are weakened. The gutturals and palatals disappear altogether; the cerebrals remain as *r* (S.E. Eur. *ṛ*), the labials partly as *v*, the dentals as *l* in the European and Armenian dialects and as *r* in the Asiatic.

Sanskrit	Romany	Sanskrit	Romany
yūkā "louse"	*ǰuv* id.	*ágataḥ* "came"	*alo* id.
sūcī "needle"	*suv* id.	*vijanati* "bears young"	*benel* id.
kīṭáḥ "insect"	*kiri* "ant"	*bidālaḥ* "cat"	*blári* (Syr.) id.
sthāpáyati "places"	*t'ovel* id.	*píbati* "drinks"	*piel* id.
yuvatíḥ "young woman"	*ǰuvel* id. *ǰůăr* (Syr.)	*hṛdayam* "heart"	*yilo* id. *ḫri* (Syr.)

Assimilation of consonant groups has occurred generally, with the exception of *r* preceded by a stop and of sibilants followed by dental or cerebral stops, except in the Armenian dialect.

Sanskrit	Romany
dugdhám "milk"	*t'ud* (from *duddham*), Arm. *lut'*.
bhrātā "brother"	*p'ral* id., Arm. *p'al*, Syr. *bar*.
hástaḥ "hand"	*vast*, Syr. *ḫăst*, Arm. *at'*.

Grammar.—In grammar too the main structure of the better preserved dialects rests upon its Sanskrit original. The declension of the noun is based on two cases, a direct (descended from the Sanskrit nominative and accusative) and an oblique (descended from the Sanskrit genitive) to which various postpositions can be added.

	Sanskrit	Prakrit	Romany
Sing. nom.	*cōráḥ* (*-ó*)	*cōrō*	*čor*
acc.	*cōrám*	*cōraṁ*	*čor*
gen.	*cōrásya*	*cōrassa* (*-asa*)	*čores*
Pl. nom.	*cōráḥ*	*cōrā*	*čor*
gen.	*cōrāṇām*	*cōrāṇaṁ*	*čoren*

The verb is built up of the old present stem, of which the indicative, the imperative and the participle still survive, and of the past participle, which alone or combined with auxiliaries forms past tenses.

		Sanskrit	Romany
Present indicative:	Sing.	*rákṣāmi*	*rak'av*
		rákṣasi	*rak'es*
		rákṣati	*rak'el*
	Pl.	*rákṣāmas*	*rak'as*
		rákṣatha	*rak'en*
		rákṣanti	*rak'en*

The opposition between present stem and past participle, though in most cases the latter has been remodeled on the former, still survives in a few verbs:

Skt. *márate* "dies" : *mṛtáḥ* "dead" = Ry. *merel* : *mulo*.
" *yáti* "goes" : *gatáḥ* "gone" = " *ǰal* : *gelo*.

Romany has preserved the Sanskrit numerals 1 to 6, 10, 20 and 100 but 7, 8, 9 and higher numbers are borrowed—by Asiatic generally from Persian, by European from Greek—or are formed by various methods of addition or multiplication from existing numerals.

Vocabulary.—The borrowing of vocabulary has been extensive. The first examples can be dated back to the time when, leaving the central group of dialects in India, the gypsies sojourned among the speakers of the northwestern group. Indeed, the borrowed words of a Romany dialect disclose the itinerary of its migrations. When in the dialect of the gypsies of Wales there are borrowed words from Persian, Armenian, Greek, Rumanian, Bulgarian, Serbian, Czech, German, French and English, it may be assumed that at some time or other the ancestors of this particular group passed through the countries where these languages were spoken. The form in which the words appear may give some clue as to the date when they were borrowed. The most numerous source for the European dialects is Greek, a fact which accords with the long stay the gypsies appear to have made in the Eastern empire. *See* also GYPSY.

ROMBLON, the name of a province, the provincial capital and an island in the Republic of the Philippines. The province, located in the Sibuyan Sea south of Luzon, north of Panay and east of Mindoro is made up of three main islands, Tablas, Sibuyan, and Romblon, in order of decreasing size, plus six small populated islands, and dozens of islets and reefs. Area 512 sq.mi. (1,326 sq.km.). Pop. (1960) 131,658, an increase of 32,291 over 1939. The area was attacked by Moro pirates several times during the Spanish regime. The islands are hilly to mountainous with cultivatable land at a minimum. The highest point is Mt. Guitinguitin on Sibuyan Island which reaches a height of 6,752 ft. (2,058 m.). The most extensive level land is along the western and southern shores of Tablas and the richest soil, of volcanic and coraline origin, is found on Romblon. About 65% of the cultivated land produces coconuts and almost 30% is planted in rice; crops of cassava, sweet potatoes, bananas, corn, and tobacco are small but widespread. Larger settlements on the main islands are connected by hard-surfaced roads. Large and small interisland vessels call at Romblon; all the inhabited islands have at least weekly service. The capital is Romblon, a municipality with 27 *barrios* (villages) in addition to the *poblacion* (administrative centre), which has a deep, well-sheltered port. Pop. (1960) 16,708. The main trading and commercial centre of the province, it is a collecting, processing and shipping point for copra and a sales centre for the province's buri mats, a product of home industries. (R. E. HE.)

ROME (ROMA), a province of Italy, in the Lazio region. Area 2,066 sq.mi. (5,352 sq.km.). Pop. (1961) 2,842,268. The city of Rome represents nearly four-fifths of its population. The heart of the province is the lower valley of the Tiber; the Sabatini Mountains (north), the Sabini Mountains (east), and the Alban Hills (southeast) separate it from the provinces of Viterbo, Rieti, Frosinone, and Latina. Around the city is the Campagna di Roma, an undulating plain, much reclaimed from marsh in the 20th century. The province includes Lago di Bracciano in the north and Lago di Albano in the Alban Hills to the south. Notable places are Tivoli (*q.v.*), Velletri, Marino, Grottaferrata (with its castle-like monastery and fine wines), Albano Laziale (Roman camp), and Castel Gandolfo (the pope's summer residence and the Vatican Observatory). Rome is the focal point of transport in the Italian Peninsula, and the province is thus connected by rail and road with all parts of the country. The Leonardo da Vinci airport at

Fiumicino handles much of Italy's air traffic. Civitavecchia and Anzio are the principal fishing ports. Market gardening and dairying are important in the reclamation district of Maccarese on the lower Tiber and around Tivoli, and fruit and vines are grown in the Alban Hills. Industry is confined mainly to the city of Rome, its suburbs, and Civitavecchia. (G. KH.)

ROME, capital city of the Italian Republic and of the province of Rome (*q.v.*). The seat of the Italian government, it is one of the great cultural centres of the world and, as the seat of the pope (in the Vatican City), it is also the administrative and spiritual capital of the Roman Catholic Church. Rome is on the Tiber (Tevere) River in central Italy, 15 mi. (24 km.) from the Tyrrhenian Sea, and is surrounded by the undulating plain of the Campagna di Roma (*q.v.*). Pop. (1961 census) 2,188,160; (1964 est.) 2,429,594. The Tiber flows through the city from north to south, the Seven Hills (the Capitoline, the Quirinal, the Viminal, the Esquiline, the Caelian, the Aventine, and the Palatine) being on the left bank of the river. The earliest settlement was on the Palatine, and from there the city spread until the Seven Hills were enclosed. On the right bank of the river are the Vatican City and the hills Monte Mario and Monte Gianicolo (Janiculum). The Tiber is unsuitable for navigation except for small vessels.

Proximity to the sea has influenced the climate, summer temperatures being high with little humidity and winter temperatures seldom falling as low as −3.8° C (25° F). The wettest season is the autumn, and the annual rainfall averages 33 in. (838 mm.). (X.)

I. ARCHITECTURE AND ART

A. THE ANCIENT CITY

1. Topography.—The location of Rome resembles that of the City of London in that it occupies the last point on the River Tiber at which higher ground approaches the water's edge on both banks, offering, in conjunction with the Tiber island, an ideal crossing point. By classical times the growth of the delta and the progressive deterioration of the river's navigability had already led to the establishment of a river-mouth port, Ostia (*q.v.*), and most of the traffic between Ostia and Rome was by barge. But during the critical earliest centuries of the city's growth the Tiber was still the major traffic artery of central Italy, and it was Rome's location at the intersection of this and of the principal land route from Etruria to Latium and Campania that made it the natural political and economic centre of the whole region. The subsequent establishment of a network of main roads, and in modern times of railways, radiating from the same point perpetuated a situation first established by the logic of geography.

The detailed topography of the city from its first foundation until quite modern times has been largely determined by the character and disposition of the hills and valleys upon which it was established. Geologically the whole of the Campagna, the countryside of which Rome is the centre, is the product of the volcanic action which resulted in the hills and craters of the Bracciano Range (the Monti Sabatini) 20 mi. (32 km.) to the northwest, and those of the Alban Hills 15 mi. (24 km.) to the southeast. The ash and other debris from these eruptions built up a series of mainly horizontal and gently sloping stratified deposits, up to 100 ft. (30 m.) deep near Rome and far deeper nearer the Alban Hills. These deposits, bedded on the underlying Pliocene clay, comprise a variety of brownish tufas (cemented ash), ashes and cinders, cappellaccio or friable gray tufa, and temporary weathered surfaces, interrupted here and there by the hardened streams of lava that flowed from the craters from time to time.

Contrary to long-established belief, this volcanic activity took place long before historic times, the only record of prior human settlement being at Torrimpietra, near the coast 12 mi. (19 km.) to the west, where a Paleolithic (Acheulean and Mousterian) working floor was excavated in 1953–58 beneath the tufas characteristic of the latest eruptions of the Monti Sabatini series. Geologically speaking, however, the Roman Campagna is very recent and still in a state of very active erosion. In particular, the edges of the higher ground bordering the Tiber and its main tributaries are seamed with shallow, steep-sided, lateral valleys delimiting tongues of undulating higher ground that were ideally suited for primitive settlement. These projecting ridges, rising 60–80 ft. (18–24 m.) above the riverside plains, constitute the traditional "hills" of Rome, of which the highest point within the walls, at Porta Pia, is 128 ft. (39 m.) above sea level, compared with 39 ft. (12 m.) at the Forum.

The difference in level between the various quarters that came to be comprised within the city boundaries, though superficially much altered by human activity, have remained at all periods a cardinal factor in the city's topography. The initial settlement took place on the hills nearest the river, gradually spreading down into and draining the adjoining valleys. In the later Republic two large new areas were made available: the higher ground at some distance from the river by the building of high-level aqueducts; and the Campus Martius, the stretch of low-lying ground within the bend of the river, as a result of drainage and the embankment of the river itself.

At its maximum extent in the 3rd century A.D. the city came to occupy the whole area within the Aurelian Walls, an area of 4 sq.mi. (10 sq.km.) with a population variously calculated at 800,000 to 1,200,000. In the early Middle Ages the destruction of the aqueducts made the higher ground once more virtually uninhabitable, and with the steady dwindling of the population to a mere 35,000 in the later Middle Ages the medieval town came to be concentrated almost entirely on the riverside plains in and around the Campus Martius and across the river in Trastevere. It was not until the reactivation of the Acqua Felice, the first of the new high-level aqueducts, by Pope Sixtus V in 1586–89 that the city was once more able to expand upward and outward toward its ancient limits. The process was still far from complete by 1870, when there were still large areas of parkland, vineyards, and market gardens within the circuit of the Walls of Aurelian.

2. The First Settlements.—The Roman Campagna was one of

the last areas of central Italy to be settled. There are substantial traces of Neolithic and Bronze Age settlements along the coast, in the Sabine and Volscian hills, and here and there along the Tiber Valley, but penetration into the forests that covered the rest of the countryside seems to have been local and sporadic. Then about 1000 B.C. there was an extensive and complex movement of many small but related groups of peoples, affecting the whole western coastal area of central Italy, with repercussions as far afield as Lucania (Sala Consilina), the Aeolian Islands, and Sicily (Morgantina). The precise affiliations of this movement are disputed, but it was certainly related to the broader movement of the Late Bronze Age Urnfield peoples of the Danube Basin and central Europe, and it incorporated elements of the Bronze Age populations of central Italy. The upshot was the establishment of the settlements from which the historic peoples of southern Etruria and Latium were derived: to the north of the river the Villanovans, who established the cultural and political framework within which the historical Etruscan civilization developed; and closely related to, but distinct from them, a group of peoples who spoke Latin, a branch of the Indo-European family of languages, and who settled predominantly south of the river.

The later traditions which attributed the foundation of Rome to refugees from Alba Longa, united with elements drawn from the Sabine peoples, is now known to be substantially founded on fact. Already in the Bronze Age there had been a small riverside settlement, perhaps on the Aventine, the remains of which have been found in deposits of earth that were used later to raise the level of the adjoining Forum Boarium. In the Early Iron Age, probably toward the middle of the 8th century, this settlement was superseded or absorbed by immigrant groups of shepherd farmers, who took possession of the hills overlooking the river crossing and the Forum Valley (notably the Palatine, though not at this early date the Capitoline). Excavation has revealed their huts on the Palatine and an important, predominantly cremation cemetery at the east end of the Forum, the utensils and pottery in both cases attesting a close relationship with the contemporary or slightly earlier settlements on the Alban Hills. Once established, they were soon joined by the peoples whose remains have been found on the Esquiline and Quirinal ridges. Though closely related, the latter buried their dead and their affinities are with the older settlements of the Sabine Hills.

There is much still to be learned about the stages by which the several communities, consisting at first probably of a loose grouping of small villages, each retaining a certain independence within the larger unit, gradually coalesced into a closer association. The processes of urbanization were greatly hastened by the Etruscan domination of the city in the 6th century B.C. To this or to the immediately preceding period belong the drainage and first paving of the Forum Valley (about 575 B.C.) to serve as a common centre for the adjoining village communities; the introduction of the building methods already established in Etruria; the extensive importation of luxury goods, including Corinthian and, later, Attic pottery; the spread of settlement down into the valleys and over the adjoining uplands; and, shortly before 500 B.C., the building on the Capitoline of a large state temple to Jupiter, Juno, and Minerva.

The so-called Servian Wall, a rampart and wall enclosing the Palatine, Capitoline, Quirinal, Viminal, and Aventine, and most of the Esquiline and Caelian hills, is substantially a later monument, dating almost certainly from 378 B.C. With the possible exception, however, of the southern hills (Caelian, Aventine) for which evidence is lacking, the greater part of the area within it had already been occupied before the Etruscan kings were expelled, an event which took place traditionally in 509 B.C. (or, as one school of archaeologists believes, 25 to 30 years later); and there is reason to believe that across the northern hills the Servian Wall was built into an earlier rampart, of early Republican or even late regal date. By then the essential framework within which the centre of Rome was to develop had already been established.

3. Building Methods and Materials.—The buildings of the earliest settlements were simple huts (*capanne*) of wickerwork plastered with clay upon a timber framework, as represented in the hut urns of the Forum cemetery; and as late as the end of the Republic the normal materials for domestic use were timber and mud brick. Monumental architecture in more durable materials was first introduced by the Etruscans in the 6th century B.C. The local volcanic tufa lent itself to quarrying in large squared blocks, which for many centuries remained the normal building practice for the walls of temples and other public buildings. The softer tufas were regularly faced with stucco, to weatherproof them. Columns, architraves, and roofs were of timber, the exposed surfaces of which were faced with brightly painted revetments of molded terra cotta. It is these architectural terra cottas that constitute the principal direct sources for knowledge of Roman monumental architecture in this early, etruscanizing phase.

Before the Gallic fire of *c.* 390 B.C. practically the only building stone in use was the soft gray tufa called cappellaccio, quarried at the foot of the Capitol. The capture of Veii in 396 B.C. made available the more uniformly textured yellowish-gray tufa of Grotta Oscura, 6 mi. (10 km.) N of the city near the Tiber, which remained the most popular building material for the next two centuries. Though more durable than cappellaccio, it was still far from satisfactory and accordingly, during the 3rd century, the stronger, dark-gray tufa (*lapis Albanus, peperino*) of the Alban Hills began to come into use, followed soon afterward by the similar though rather coarser Gabine stone from the quarries beside the Gabine Lake, a volcanic crater 12 mi. (19 km.) E of Rome. These were better-quality stones and their introduction made it possible increasingly to substitute stone for the traditional timber of columns and architraves; but they were also expensive to transport and were normally used in conjunction with softer local tufas, the latter being relegated to positions of secondary structural importance. Under the late Republic and early Empire such differential uses of materials were normal.

During this period the tufa in common use was the cheap, durable, brown stone from the Anio Valley just above Rome, which was discovered in time to be used for the building of the Aqua Marcia (144 B.C.). Together with travertine and marble, it is the building stone most widely represented in the surviving monuments. Travertine, the splendid silvery-gray stone of the Colosseum, the Farnese Palace, St. Peter's, and countless other Roman monuments, is a limestone of recent origin. Soft and easily worked when first exposed, it soon hardens on exposure. The quarries at Bagni di Tivoli, which are still worked, are on level ground and escaped attention until the latter part of the 2nd century B.C.; but thereafter for nearly two centuries travertine was used in Rome in very large quantities both for its strength and for its handsome appearance.

The other materials that made their appearance under the late Republic were marble and concrete. Marble, first imported as a luxury material from Greece soon after 150 B.C., was important also at first as the medium for the introduction of a whole new set of building styles and practices, based on Hellenistic rather than Etruscan models. Then, with the opening up of the quarries at Carrara about 40 B.C., it became the fine building material par excellence of Augustan Rome, a position which—supplemented by the ever-increasing importation of marbles, porphyries, and granites from Greece, Egypt, and Africa—it retained throughout antiquity.

Less showy, but of even greater architectural and structural importance, was Roman concrete, which makes a first tentative appearance in the form of random mortared rubblework during the 3rd century B.C. and was already used for substantial vaulted buildings in the 2nd century (*e.g.*, the Porticus Aemilia, 193 B.C.) but which was not finally perfected until Augustan times. It was essentially a hydraulic cement, used normally with an aggregate of tufa, tile, or whatever other material was available, and it derived its unique strength from the properties of the dark volcanic ash (pozzolana) of the Roman subsoil, which was employed as a substitute for sand. Used at first as an inert fill for ramparts and platforms, it proved to be cheap, easy to handle, and very strong.

The development of concrete barrel vaulting in place of the traditional flat timber roof opened up important new constructional fields. Together with the perfection of the material and the realiza-

Sheep grazing across an ancient road on the outskirts of Rome. This road, and an elaborate network of others like it, once linked the capital with the rest of the empire

tion that it could be used to create architectural forms that were no longer restricted by the limitations of the traditional building materials, it paved the way for the revolution in architectural thinking which is Rome's great original contribution to the history of classical art. The key monuments of this revolution, which falls between A.D. 65 and about 135, are all in or near Rome: Nero's Golden House, Domitian's Palace, the Pantheon, Hadrian's Villa near Tivoli. It was in these buildings that the concept of architecture as the organization of interior space first found conscious expression, an event which can fairly be claimed as changing the whole subsequent history of European architecture.

Roman concrete was normally used in conjunction with other materials, at first stone and then, from Augustan times onward, increasingly brick and tile. It is important to realize, however, that although these secondary materials served a purpose during construction, helping to contain the concrete core while it was drying out, and also gave a decorous finish to the completed building, the essential structure was that of the concrete itself. Brick was never used in classical Rome as a material in its own right. The brickyards lay just outside Rome in the Tiber Valley and beyond the Vatican Hill, and many of them came in time to be organized for very large-scale production. The stamped trademarks of the individual yards are a valuable aid to the chronology of the buildings in which they were used.

4. Town Walls.—On both the Palatine and the Capitoline hills there are traces of defensive walling that may date from the 6th century B.C., and in the 5th century there was probably an earthen rampart and ditch across the exposed northeastern flank of the Quirinal and Esquiline promontories. The first continuous defensive wall, incorporating parts of these earlier fortifications, was the so-called Servian Wall, built in the early 4th century B.C. after the Gallic disaster, a representative stretch of which, denuded of its earthwork, can be seen just outside the modern railway station. By the 3rd century B.C. the area it enclosed (about 800 ac. [325 ha.]) was proving inadequate for the city's growing needs; but although the formal city limits (pomerium) were extended on numerous occasions, Rome for many centuries felt no need of fresh defenses. The great wall of brick-faced concrete which was Rome's defense throughout the Middle Ages, and which as late as 1870 had to be assaulted and breached by Raffaele Cadorna's troops, was begun by Aurelian in A.D. 270. Nearly 10 mi. (16 km.) long and enclosing an area of about 4 sq.mi. (10 sq.km.), it marks the approximate maximum extension of the classical city. The principal gateways were rebuilt by Honorius and Arcadius in A.D. 401–403.

5. Aqueducts.—The first aqueduct was built in 312 B.C. by Appius Claudius. It was 7 mi. (11 km.) in length and ran underground. The first of the high-level aqueducts, the Aqua Marcia, followed in 144 B.C., bringing an abundance of excellent water from the Sabine Hills, 44 mi. (71 km.) away. In order to serve the higher ground within the city it was raised on arches where it crossed the plain outside the walls, an example that was followed by later builders, among whom Augustus, Agrippa, Claudius, and Trajan were outstanding. Within the city there was elaborate provision for distributing the water in conduits and lead piping to individual quarters and buildings on a scale unequaled until the present century. (*See* further AQUEDUCT.)

6. The Forum.—Nowhere in Rome has human activity done more to alter the natural contours of the landscape than in the area of the Forum. It is not merely that the modern ground level has risen by as much as 50 ft. (15 m.) in the valley bottom. In laying out the Via dei Fori Imperiali, Mussolini was only completing the work of Vespasian and of Trajan in cutting away the saddles of higher ground which once linked the Quirinal and the Esquiline with the Capitoline and Palatine hills respectively. The drainage of this whole area passed, and still passes, through the narrow gap between the Capitoline and the Palatine, and when the adjoining hills were first settled the open space just above the gap was a marshy valley, around the edges of which accumulated the rubbish and building debris from the settlements on the higher ground. Along the western edge of it, flanking the southern extremity of the Esquiline and the western slopes of the Velia, the saddle between the Esquiline and the Palatine, there grew up the extensive cemetery which, together with the excavated hut sites on the Palatine, is the principal source of detailed information about the earliest stages of the city's history. Three monuments of the classical period preserved memories of the same pre-urban period: the Lacus Curtius, on the site of an open pool in the centre, and the Lacus Servilius and the Lacus Juturnae, marking the sites of springs at the foot of the Capitoline and Palatine hills respectively. The former disappeared during the early Empire, but the latter survived and was restored in 1953 to the form which it bore in Augustan times.

The line of the Cloaca Maxima, running obliquely across the later Forum, marks the approximate line of the original valley-bottom stream. Although little of the surviving structure is as early as the traditional 6th-century date of the Cloaca, the original canalization of the stream must have taken place when the valley between the early communities on the several hills was first laid out to serve as a meeting place common to all of them. Stratigraphic excavations near the centre of the later paved area and again near the east end date this event about 575 B.C.

The topography of the successive phases of the Republican Forum has been the subject of much learned controversy. With the exception of a few venerable monuments, few of the remains now visible are earlier than the time of Caesar and Augustus, when the Forum paving reached the level to which it has now once more been excavated; and although many of the Imperial buildings perpetuate the names and approximate positions of earlier monuments, not all of these by any means are on the exact sites of their predecessors. Trial excavations in depth undertaken since World War II have done much to clarify the chronology but have yielded little detailed information about the buildings themselves. There remain a great many points upon which, in the present state of knowledge, one can only speculate.

In its broad outlines the development is clear enough. From the outset the Forum served a multiplicity of purposes—market, place of political assembly, lawcourt, a setting for parades and spectacles, the natural location for temples and public buildings of all sorts. Many of these aspects came in time to be housed elsewhere, but many others, particularly those with religious connotations, remained to shape the later development. Among the later buildings of which the origins date back to the early days of the Republic were the temples of Castor and Pollux, Janus, Saturn, and Vesta; the Regia, the office of the *pontifex maximus;* and the group of buildings at the northwestern corner of the Forum, associated with the Curia and the Comitium.

The central area, itself a formally consecrated monument, was an open space, roughly trapezoidal in shape, measuring about 125 by 70 ft. (38 by 21 m.). On it converged a number of streets. The Via Sacra, which crossed the area longitudinally, entered near the northeastern corner beside the Regia through an arch (the Fornix Fabianus), leaving it at the southwestern corner under the name of the Clivus Capitolinus, which led up to the Temple of

Jupiter and the citadel. Descending the valley from the Quirinal and the Viminal by the Argiletum, one entered near the Temple of Janus, beside the Curia. The Clivus Argentarius, from the Campus Martius, entered at the northwestern corner. Of the two streets leading up the valley from the Forum Boarium, the Vicus Jugarius entered at the southwestern corner, beside the Temple of Saturn, and the Vicus Tuscus near the southeastern corner, between the Temple of Castor and Pollux and the Basilica Julia. Along the south and north sides were two rows of shops, the Tabernae Veteres and Novae respectively, and to a late Republican date there were still private houses near enough to overlook the central space.

The first large civil buildings were the great Republican basilicas, open columnar halls designed to serve as covered extensions of the main open space, the sanctity of which was preserved by building them alongside. The first was the Basilica Porcia (184 B.C.), west of the Comitium; it was burned in 52 B.C. and never rebuilt. The Basilica Aemilia followed in 179 B.C. behind the Tabernae Novae, and opposite it nine years later the Basilica Sempronia, behind the Tabernae Veteres, on the site later occupied by the Basilica Julia. With the construction of the two latter, and the addition in 78 B.C. of the Tabularium at the west end, up against the steep slopes of the Capitoline, the haphazard layout of the Forum began to assume a certain monumental character. It was Caesar, however, who completed the process. Hitherto the Comitium, the political assembly, had been a virtually independent open space opening off the northwest corner of the main Forum and separated from it by the Rostra, the orator's tribunal, which stood between the two, facing northward across the Comitium toward the Curia. Caesar moved the Rostra to the centre of the west side of the main Forum, facing axially down it; and the Curia, burned together with the Basilica Porcia in the riots following Clodius' funeral, he brought forward to the position adjoining the main square which it was to occupy thereafter throughout antiquity. With the construction shortly after his death of the Temple of Divus Julius facing axially down the Forum from the opposite end, the essential layout of the Forum as we see it today was complete.

The description that follows describes the monuments in clockwise order, starting from the northwest corner. For convenience in reading, the names of major structures are italicized at the beginning of a description.

The *Carcer* or *Tullianum* ("Mamertine Prison") took the place, as death chamber, of the old quarry caverns beneath the northeast corner of the Capitoline. The original structure, a truncated cone of Alban stone entered only by a trapdoor in the roof, dates from the 3rd century B.C.; the existing travertine facade, the last of a series of additions and modifications, dates from the time of Tiberius. This is the chamber where noted prisoners like Jugurtha, the Catilinarian conspirators, and Vercingetorix were kept before execution.

Below it, on the lowest slopes of the hillside and stretching out into the open valley, lay the political centre of early Rome, the Comitium. The stretch of pavement now visible between the Curia and the Arch of Severus is only a part of the original area, which until the time of Caesar extended farther to the north. In and beneath it can be seen a number of venerable remains, including those of the *Republican Rostra* and of the group of structures associated with the much-discussed inscribed archaic stele. The Rostra, the scene of Rome's early legislative struggles, took its name from the iron rams (*rostra*) taken as trophies from the warships of Antium (338 B.C.) and fastened on the back of the platform, facing the Forum. The stele, already damaged when buried, bears the lower part of a boustrophedon inscription in lettering which can hardly be later than about 500 B.C. The language is a very archaic Latin, and, although the content of the text is controversial, it was certainly religious in character, stipulating certain duties of the priestly *rex*, perhaps in connection with the prevention of evil omens. The adjoining remains include a tapering drum, which may have carried a statue, and the lower part of a double base with Tuscan moldings, said by Varro to have supported two lions and possibly funerary in character. Being sacred, the group was carefully buried and marked by a slab of black Greek marble, the *lapis niger*, when Sulla rebuilt the Rostra and repaved the whole area.

Of the other buildings associated with the Republican Comitium only the *Curia* (Senate House) is now visible, and that in the position to which it was moved by Caesar. The present building is the work of Diocletian after the fire of A.D. 284. The evidence of coins suggests that, except for the omission of a low portico in front, it repeats closely the design of its predecessors, a gabled building with a single large door and three windows above it. The bronze door is a replica of the Diocletianic door, now in the Church of St. John Lateran. The bare brick of the facade was faced with marble and with stucco imitating masonry. Inside can be seen the handsome (partly restored) marble intarsia floor and the steps for the wooden stools of the senators and the two consuls and the base for the altar of Victory, the building's presiding divinity. Also housed here for safety are the *Anaglypha Traiani*, two marble reliefs showing the buildings of the Forum as they were about A.D. 100. The Curia survived the Middle Ages as a church, dedicated to S. Adriano in A.D. 630, and it was restored to its original form and level in 1938. The adjoining Church of SS. Luca e Martina similarly incorporates remains of the Secretarium Senatus, the senatorial archives.

East of the Curia, across the Argiletum, lay the *Basilica Aemilia*. The scanty surviving remains are those of the Augustan rebuilding, after the fire of 14 B.C., modified and enriched as to its upper story in A.D. 22. The shops along the facade replaced the former Tabernae Novae, and there were galleries facing both inward on to the central hall and outward on to the Forum. One of the first buildings in Rome to make lavish use of imported coloured marble, it was ranked by Pliny as one of the three finest buildings of the capital. The date of the marble frieze from the lower of the two classical orders of the interior, portraying scenes from the legendary history of early Rome, is controversial; it is most likely that it was reincorporated in the Augustan structure from one of its predecessors, perhaps that of 34 B.C. The foundations exposed near the west end are those of the Republican basilica.

East of the basilica stands the temple dedicated in A.D. 141 to *Faustina*, deified wife of Antoninus Pius, and after his death to *Antoninus* himself. It was preserved through the Middle Ages as the Church of S. Lorenzo in Miranda, the door of which marks the height (39 ft. [12 m.]) above the classical pavement to which the ground level within the Forum had risen since classical times by the 17th century. Opposite it stood the Regia, one of the earliest buildings of Rome. By tradition the residence of Numa Pompilius, it became the office of the *pontifex maximus*, who succeeded to the priestly duties of the monarchy. It occupied an elongated triangular site between the two branches of the Via Sacra, which forked at this point, the two branches passing along the northern and the southern edges respectively of the Forum. The left-hand branch is certainly a very ancient feature, and the early foundations of the Regia were aligned upon it. Like the adjoining buildings it suffered badly at the hands of medieval lime burners and Renaissance marble robbers. The scanty remains are chiefly those of the building of 36 B.C., one of the earliest monuments in Rome to be built of marble from the newly opened quarries near Carrara.

Across the street lay the *Domus Publica*, the official residence of the *pontifex*, and beside and to the west of it the Atrium Vestae, the House of the Vestal Virgins, whose task it was to tend the sacred flame in the *Temple of Vesta*. The circular form of the temple, which stood just west of the Atrium Vestae, was traditional, deriving originally from that of a timber hut, but although the cult was of great antiquity, the flame symbolizing the well-being of the city, the only remains now visible are of much later date. The foundations and podium are from the reconstruction of the building in marble undertaken by Augustus in 14–12 B.C., as portrayed in a relief now in the Uffizi in Florence. The partially restored superstructure is the work of Julia Domna, wife of Septimius Severus, after the fire of A.D. 191. The cult was one of the last pagan cults to be suppressed, by Theodosius in 394. The well-preserved remains of the *Atrium Vestae*, consisting of a spacious central courtyard surrounded by two stories of marble porticoes from which suites of rooms opened off, date from after the fire

of A.D. 64, with additions and alterations by Trajan, Hadrian, and Septimius Severus. Around the courtyard are the bases of statues in honour of distinguished Vestals. The building now visible follows the Neronian alignment, but here and there can be seen remains of the earlier, smaller buildings, aligned on the Via Sacra, including (near the northeast corner) those of the Caesarian Domus Publica, which Augustus handed over to the Vestals in 12 B.C., when he transferred his residence to the Palatine.

After passing the Temple of Vesta the Via Sacra entered the Forum between, on the left, the Temple of Castor and Pollux and on the right, closing the eastern end of the paved area, the Temple of the Deified Caesar (Divus Julius). Between the two stood the *Arch of Augustus*. Originally a single arch built in 29 B.C. to commemorate the victory of Actium, it was enlarged to form a triple arch in 19 B.C., after the recovery of the standards captured by the Parthians from Crassus. On the walls of the arches were inscribed the *Fasti consulares*, the official lists of eponymous magistrates since the foundation of the Republic, the surviving fragments of which are now in the Conservatori Museum.

The *Temple of Castor and Pollux* dates back to 484 B.C., commemorating the divine intervention of the twins at the Battle of Lake Regillus (*see* CASTOR AND POLLUX). Parts of the original podium, in blocks of cappellaccio, and of its replacement in concrete faced with tufa are preserved within the surviving structure, which is that dedicated by Tiberius in A.D. 6. The core of the latter was of concrete faced with travertine and tufa, the outer facing and the superstructure, including the three standing columns (since the Middle Ages one of the landmarks of the Forum area), of Carrara marble. Castor and Pollux were the patron deities of the Roman knights, and the temple not only became their official meeting place and an unofficial centre of the city's commercial interests, but also it came to include in the basements safe deposits and a bureau of weights and measures.

Of the *Temple of the Deified Caesar*, dedicated in 29 B.C., all that remains is part of the concrete core and the partly reconstructed front of the podium. Of the temple itself, which was a lofty Ionic building, only a few fragments are preserved. A semicircular recess in the centre of the facade marks the position either of the marble column erected immediately after Caesar's death to mark the spot where his body was cremated or else of the altar that accompanied it.

The very large brick structure behind the Temple of Castor and Pollux, long thought to be the Temple of Augustus, is in fact the *Vestibule* or official entrance to the Flavian Palace on the Palatine. It comprises the vestibule proper, a large chamber decorated with niches and once vaulted, a series of guardrooms, and a broad ramp zigzagging up to the plateau above. The site of the guardroom was converted in the early Middle Ages into the Church of Sta. Maria Antiqua, remarkable for its series of wall paintings dating from the 7th, 8th, and 9th centuries. Beyond the Vestibule, along the Vicus Tuscus, is a warehouse, the Horrea Agrippiana, and across the street, as yet unexcavated, lay the Temple of Augustus.

The whole of the south side of the Forum was occupied by the *Basilica Julia*, begun by Caesar in 54 B.C. on the site of the Tabernae Veteres and the Basilica Sempronia. It was destroyed by fire soon

THE FORUM ROMANUM: (TOP) THE REPUBLICAN PERIOD; (BOTTOM) THE IMPERIAL PERIOD

after, and again in A.D. 284. The scanty surviving remains follow substantially the lines of the building dedicated by Augustus in A.D. 12. It consisted of a lofty central hall surrounded by two stories of ambulatory galleries and was subdivided internally by curtains or partitions for use as a lawcourt. Along the back can be seen the row of shops and offices that replaced the old Tabernae. Immediately to the west of the basilica, across the Vicus Jugarius, lay the *Temple of Saturn*. One of the oldest temples in Rome (traditionally 497 B.C.), from its proximity to the Senate House it came to be used for the storage of state money, the vaults serving as the Aerarium, or state treasury. The surviving podium and a few fragments of the marble superstructure date from its rebuilding *c.* 30–22 B.C. by Munatius Plancus, the founder of Lyons. The well-known facade, with its eight columns of Egyptian granite, is a reconstruction of the 4th century A.D., incorporating decorative fragments from the Forum of Trajan.

Westward again from the Temple of Saturn, on the lower slopes of the Capitoline, is the partially recomposed colonnade of the *Dei Consentes*, the 12 chief gods of Olympus, each of whom was represented by a statue within a square chamber opening off a trapezoidal portico. The present remains are those of an unrecorded reconstruction of the 1st century A.D., restored in 367. Beside it to the north stood the *Temple of the Deified Vespasian*. The three standing columns were restored by G. Valadier in 1811, and a section of the richly carved entablature is preserved nearby in the vaults of the Tabularium.

To the north again is the site of the *Temple of Concord*. Vowed by Camillus in 367 B.C. to commemorate the temporary cessation of the political struggle between patricians and plebeians, rebuilt and enlarged by L. Opimius in 121 B.C., the present remains, consisting of little more than the podium, are those of its reconstruction by Tiberius, dedicated in A.D. 10. For reasons of space the plan was unusual, the long axis of the cella being at right angles to the porch, which projected from the middle of one long side. Built of Carrara marble, it was paved and its walls faced with coloured marble, and it housed a remarkable collection of Greek paintings and sculpture.

In front of the Temple of Concord, on the edge of the Forum proper, are the *Arch of Septimius Severus* and, beside it, the *Caesarian Rostra*. The former was erected in A.D. 203 to commemorate the emperor's victories over the Parthians; its sculptured panels are a fundamental document for the transition from classical to late antique art. The latter is of two main periods, the original Caesarian curved structure, enlarged and squared off by Augustus. Behind it stood five honorary columns, as depicted on the Arch of Constantine. In front, down the length of the paved open space, were crowded monuments of every period. Among them can be seen the enclosure in which were housed a statue of Marsyas and the three sacred trees, a fig, a vine, and an olive; a number of ritual pits delimiting the sacred area; the site of the equestrian statue of Domitian, where G. Boni in 1899 conducted his pioneer stratigraphic excavation; and the column of Phocas, the last monument to be erected in the Forum (A.D. 608) and the first to be cleared when systematic excavation was begun in the 19th century.

Adjoining the Forum, though strictly speaking outside it, were the monuments on the Velia, the low saddle to the east. The elegant *Arch of Titus* on the crest astride the Via Sacra was erected after his death. The reliefs, which depict his triumph in 71 after the capture of Jerusalem, include representations of the seven-branched candlestick and the ark of the covenant. The adjoining church and former convent buildings of Sta. Maria Nova ("Sta. Francesca Romana") occupy the western part of the platform of the huge *Temple of Venus and Rome*, begun by Hadrian in 121 on the site of the vestibule to Nero's Golden House. The cella was double, set back to back. Burned in 284, it was restored by Maxentius, who was responsible also for the gigantic vaulted structure next to the west, the *Basilica Nova*, completed with modifications by Constantine after Maxentius' death. The last of the great civil basilicas of Rome, it marked a decisive break with the old columnar tradition, deriving instead from the concrete architecture of the great Imperial bath buildings. The three standing arches, together with three identical arches facing them, buttressed a grandiose central hall, 265 ft. long by 78 ft. wide (81 by 24 m.) and 108 ft. (33 m.) from the pavement to the crown of the vault. It fell probably in the earthquake of 847.

Maxentius also built the small circular building next to the west (so-called *Temple of Romulus*), the projecting wings and reentrant forecourt of which illustrate the Baroque character of much of this late Imperial architecture. In the 6th century it became the vestibule for the Church of SS. Cosmas and Damian. The bronze doorway is original. The confused medley of foundations that occupies the western slopes of the Velia in front of these buildings include all that remains of Nero's grandiose monumentalization of the approach to his palace from the Forum.

7. The Palatine Hill.—Tradition and archaeology agree in naming the Palatine Hill as the site of the earliest settlement in Rome. The valley that runs up from the Arch of Titus continues the line of what was once a saddle between two distinct crests, the Palatium to the east and the Germalus to the west. It was near the southern extremity of the Germalus, overlooking the river, that the "hut of Romulus" stood in later classical times; and although there may well have been other groups of early huts elsewhere on the hill, as there certainly were on the adjoining slopes of the Esquiline Hill, it is here that excavation has in fact revealed the remains of huts dating from the earliest phase of Early Iron Age settlement in Rome. There are traces of early fortifications at several points on the Germalus, but the tradition of a formal, four-square layout of the primitive city, *Roma Quadrata*, is now known to be late and mistaken.

By the end of the 3rd century B.C. the hill was a favoured location for the town houses of the wealthy, and Cicero and many of his important contemporaries owned houses along the Clivus Victoriae, the street that ran near the crest of the hill, overlooking the Forum. The subsequent architectural development of the hill was determined by the fact that Augustus established his residence on the Germalus, on property acquired through his wife and by expropriation. This was the nucleus of a palace which came in time to cover almost the entire Palatine Hill. Tiberius and his immediate successors extended it over the whole of the Germalus except for the western end, with its venerable monuments. Nero's work, though extensive, was incidental to his more grandiose schemes for the Domus Transitoria and the Golden House, and it was left to Domitian to give the palace an architectural unity by building a magnificent series of state apartments across the saddle between the Germalus and the Palatium, with a domestic wing and sunken garden extending over most of the western end of the Palatium. Later emperors, notably Septimius Severus, were concerned mainly with the embellishment and southward extension of the Domitianic building. As early as Augustus' day the word *palatium* began to be used to designate the imperial palace. The last emperor known to have repaired and occupied it was Theodoric.

The western end of the Germalus is the only part of the Palatine Hill to have retained something of its pre-Imperial physiognomy. The *Temple of Cybele*, the first of the Oriental divinities to join the Roman pantheon, offers a convenient reference point for identifying the superimposed remains of seven centuries of habitation. Cut in the bedrock in front of the temple steps are the postholes and drainage ditches of the timber-and-daub huts of the original Iron Age settlement. To the west of this, on the edge of the Hill, there is a well-preserved stretch of the archaic fortifications, and to the east of the temple can be seen a cistern of the 5th century B.C. or earlier, with a vault of fine corbeled masonry. The temple itself was built in 204–191 B.C. to house an image (nonrepresentational) of the goddess brought from Pessinus in Phrygia; the surviving remains are those of a reconstruction undertaken in 110 B.C. and of its subsequent restoration by Augustus in the traditional manner and materials, tufa and concrete with a facing of stucco.

To the east, beyond the cistern, are the well-preserved remains of the *House of Livia*, the private residence of Augustus. Built about 50 B.C. and never seriously modified, it offers a vivid picture of a Roman house of the period, including an outstanding series of wall paintings of the so-called second style. Beyond it to the

southeast are the remains of other contemporary houses with paintings, preserved by their incorporation within the substructures of the buildings added by Augustus to this nucleus. The central feature of these was the great *Temple of Apollo*, erected in 28 B.C., a large and elaborate building of Luna marble facing on to an open space framed by porticoes of Numidian marble and a pair of libraries, one Greek and one Latin. Of this, one of the richest and most lavishly adorned buildings of its day, hardly anything has survived except foundations, still only partly excavated. The visible remains of the libraries date from their reconstruction by Domitian after the fire of A.D. 64.

The rest of the Germalus was occupied by the rectangular platform of the *Domus Tiberiana*, most of it still covered by the Farnese Gardens. Built by Tiberius, it was gradually extended northward by his successors, linking up with and dominating the Forum. Caligula added a wing at the foot of the hill behind the Temple of Castor and Pollux to serve as a formal entrance to the palace; only scanty traces of this survived the grandiose remodeling of the area by Domitian, to whom are due the present Vestibule and guardrooms (now Sta. Maria Antiqua) and the great zigzag ramp up to the hilltop. The arched platform thrown out across the Clivus Victoriae, now such a prominent and picturesque feature of the Forum landscape, is the work of Trajan and Hadrian. A large covered corridor (cryptoporticus) marking the eastern limit of the Tiberian building was added by Nero.

Immediately to the southeast of the Domus Tiberiana, terraced high above the saddle between the Germalus and the Palatium, are the impressive ruins of the official wing of Domitian's palace, the *Domus Augustiana*. The facade, which faced north, opened into a basilica, used when the emperor sat in judgment, a large ceremonial audience hall, and a smaller room which may have been associated with the imperial cult. Beyond this suite lay a spacious peristyle garden with a central fountain, off the far end of which opened a state banqueting hall, flanked by two fountain courtyards. The official wing constituted the west wing of the Flavian Palace. Corresponding to it on the east side was an elongated circus-shaped sunken garden, suitable for the holding of parades or displays, and between the two, set back from the north frontage beyond a pair of colonnaded courtyard gardens, lay the domestic wing. This was built at a lower level, the surviving remains being those of the two main floors and a mezzanine floor grouped around a square, two-storied, porticoed courtyard with an elaborate central fountain. The rear facade opened on to the Circus Maximus, with the imperial box as its central feature.

The whole palace, the work of the architect Rabirius, is a landmark in the history of Roman concrete architecture. The barrel vault over the basilica was of unprecedented size, and throughout the building curvilinear walls and vaults display a new and significant interest in the properties of interior space. Other notable features are the Baroque fountains, the lavish use of imported marbles, and the central heating of the banqueting hall. The bath building beyond the sunken garden and the lofty, arched substructures at the southeast end of the hill, overlooking the Circus Maximus, were added by Septimius Severus, who was responsible also for the Septizodium (demolished in 1588), a three-tiered columnar structure resembling the stage building of a Roman theatre, erected as a decorative screen opposite the end of the Via Appia.

Incorporated within the foundation platform of the official wing are the well-preserved remains of a number of the buildings that previously stood on the open ground of the saddle between the Germalus and the Palatium. The "House of the Griffins" is a residence of the time of Cicero, noteworthy for its stuccoes, architectural wall paintings, and pavements. A painted hall adjoining it, with Egyptian motifs, is probably part of a building devoted to the cult of Isis established by Caligula; it was destroyed by Nero to make way for a circular building, perhaps a fish pool. Also Neronian, destroyed in the fire of A.D. 64, is a richly decorated nymphaeum beneath the Domitianic banqueting hall.

The northern spur of the Palatium occupied by the churches of S. Bonaventura and S. Sebastiano is still largely unexcavated. The terrace overlooking the Arch of Titus carried a large temple which is only partly explored. Originally dedicated to Augustus and the other deified Caesars, the present structure is that of Elagabalus' Temple of the Sun, rededicated by his successor, Alexander Severus, to Jupiter the Avenger.

8. The Capitoline Hill.—Though not apparently part of the original Iron Age settlement, the Capitoline Hill at a very early date was incorporated to serve as the fortress and chief sanctuary of the archaic city. It comprised two distinct heights: that on the north housed the citadel (arx) and a temple of Juno Moneta, the site of the early mint; that on the south was an area sacred to Jupiter, with a wooded asylum on the depression that lay between the two. The remains of the Arx lie concealed beneath the Church of Sta. Maria in Aracoeli and the Victor Emmanuel Monument.

In the area sacred to Jupiter the last of the kings built a magnificent temple in honour of Jupiter, Juno, and Minerva, known officially as the *Temple of Jupiter Optimus Maximus*. Dedicated in 509 B.C., it was—as the remains of the platform now exposed beneath and behind the Palazzo dei Conservatori confirm—in its day the largest temple in central Italy. The platform, measuring 203 by 174 ft. (62 by 53 m.), was built of blocks of cappellaccio. There were probably three rows of six columns each across the facade and six columns and a pilaster on either flank, and there were three cellas, one for each divinity of the triad. The walls and columns of the original building were of tufa faced with stucco, and the low, overhanging timber roof was faced with brightly painted terra cottas in the Etruscan manner. A terra cotta quadriga of Jupiter by Vulca of Veii which stood on the crest was a work of the same school as that which produced the Apollo group from Veii now in the Villa Giulia Museum. The original temple stood until it was burned in 83 B.C. Rebuilt, and twice again burned and rebuilt, each time following the same plan though with new materials and proportions, it reached its final form under Domitian, whose richly decorated marble structure with gilded tiles and gold-plated doors stood intact until the end of pagan antiquity. It was in this temple that victorious generals deposited their laurel crowns after driving in triumph up the Clivus Capitolinus, the paved way that winds up from the Forum.

The *Capitoline Palace*, which today dominates the Forum from the eastern edge of the hill, incorporates the impressive remains of the facade of the *Tabularium*. Built in 78 B.C. across the saddle between the two crests to serve as a fireproof repository for the state records, it is one of the outstanding early examples both of concrete vaulting and of the use of the arch in association with the traditional classical orders. In the vaults beneath the southeast angle of the present building can be seen the substantial remains of the Temple of Veiovis, dating from the late 2nd century B.C.

9. The Imperial Fora.—*Forum Iulium.*—By the end of the Republic the old Forum Romanum had already become impossibly cramped, and the century and a half from Caesar to Trajan saw the gradual development on all the level ground to the north of it of a series of new, secondary civic centres. This whole area was cleared by Mussolini during the 1930s, and large stretches of the classical buildings are now exposed on either side of the modern Via dei Fori Imperiali. The first of the new fora, planned by Caesar as early as 54 B.C. and financed in part out of Gallic booty, was completed after his death. It consisted essentially of an elongated rectangular enclosure with porticoes down the two long sides and, projecting from one of the short sides, a temple dedicated to the "ancestress" of the Julian family, Venus Genetrix. The surviving marble detail of the temple dates from a reconstruction by Trajan in A.D. 112, and the flanking porticoes were rebuilt in late antiquity; but the vaulted shops that open off the south portico are a fine example of Caesarian masonry.

Forum Augustum.—The Forum of Augustus lay immediately to the north of that of Caesar, which it resembled in plan, with the addition of a pair of semicircular courtyards opening off the two lateral porticoes. The temple, vowed at Philippi in 42 B.C. and dedicated to Mars Ultor ("the Avenger"), was not completed until 2 B.C. With its lavish use of Italian and imported marbles and fine craftsmanship, the work in part of Attic sculptors, it represents the culmination of the great Augustan building program.

Fora of Vespasian and Nerva.—Vespasian's Forum, more correctly known as the Templum Pacis (Precinct of Peace), was situ-

ated near the foot of the Via Cavour. Nothing of it is now visible. It was an almost square, cloisterlike precinct, the temple proper standing in the middle of the east portico, and the central area being planted with trees. It had a fine library, its collections including the treasures from the Temple in Jerusalem. It was separated from the fora of Caesar and of Augustus by a space 180 ft. (55 m.) wide through which ran the Argiletum, the main street from the Forum Romanum to the crowded tenement area of the Subura. This space was given monumental form by Domitian, who created therein the *Forum Transitorium*, completed and dedicated after his death by Nerva. The surviving stretch of the eastern flanking colonnade and its sculptured frieze have long been one of the most familiar monuments of ancient Rome, but of the Temple of Minerva, still largely standing in the 17th century, excavation has revealed only the shattered core of the podium.

Forum Traiani.—The last and most elaborate of the Imperial fora extended westward from the Forum of Augustus between the Capitoline and Quirinal hills, the lower slopes of which were cut back to make room for it. A triumphal arch led into the Forum proper, an open space nearly 400 ft. (122 m.) long and 280 ft. (85 m.) wide with flanking porticoes, beyond which were a pair of monumental hemicycles. Across the west end stood the *Basilica Ulpia*, a vast columnar hall, 390 ft. (119 m.) long, with two ambulatory colonnades and a large apse at either end. To the west again a pair of libraries flanked a small, two-storied courtyard in which stood the *Column of Trajan*. This column, which has survived intact and is one of the outstanding masterpieces of Roman relief sculpture, stands 125 ft. high together with its base, within which the emperor was buried; the shaft is covered with reliefs arranged in a spiral band representing the events of his two campaigns in Dacia. Nothing now remains of the great Temple of Trajan which Hadrian erected west of the column. To the north of the basilica and the northern hemicycle of the Forum, terraced up the steep slopes of the Quirinal Hill, are the remarkably preserved remains of *Trajan's Market*, an ingeniously planned complex of concrete structures incorporating a covered market hall with shops accessible at three distinct levels.

10. The Forum Boarium, Circus Flaminius, and Campus Martius.—*Forum Boarium.*—The original river crossing lay at or near the Tiber island, opposite the Palatine and Capitoline hills. Here were the early cattle market (Forum Boarium) and vegetable market (Forum Holitorium) around which there came in time to be grouped a number of small temples. Two of these, traditionally but incorrectly known as the *temples of Vesta* and *of Fortuna Virilis* (the true dedications are disputed), are still standing, having been rededicated as churches early in the Middle Ages. The former, an elegant circular building, lacks only the steps and entablature; built of Pentelic marble, it is a product of the imported hellenizing taste of the early 1st century B.C. The latter, a nicely proportioned rectangular Ionic building, may be a few decades later. It is constructed of tufa reinforced at all points of special stress with travertine, and the whole was once faced with stucco.

The remains of three more temples, one Doric and built of travertine and the other two Ionic and built of tufa, are incorporated into the Church of S. Nicola in Carcere. Dedicated to *Juno Sospita, Spes,* and possibly *Janus,* and dating originally from the 3rd or early 2nd centuries B.C., the present buildings are probably Augustan, as restored after the fire of 31 B.C. with a liberal reuse of earlier materials. A sacred area exposed beneath and beside the Church of S. Omobono is almost certainly that of the twin *temples of Fortuna* and *Mater Matuta,* rebuilt by Camillus after the conquest of Veii and again in 212 B.C. after a fire in the previous year. From the deeper levels of the excavation came important architectural terra cottas of Etruscan and Latian type and, redeposited here from some nearby site, numerous Bronze Age sherds. The remains of the very ancient circular *Temple of Hercules Victor* were destroyed by Sixtus IV (1471–84). It stood behind the Church of Sta. Maria in Cosmedin, the body of which incorporates the columns of the offices of the grain commissioners.

Other surviving monuments in the Forum Boarium are a late (Constantinian?) four-way arch (Janus Quadrifrons) which stands over the Cloaca Maxima and a small arch erected to Septimius Severus by the silversmiths of Rome. Extensive riverside wharves, offices, and warehouses were uncovered and destroyed when the Via del Mare (now Via del Teatro di Marcello) was built in the 1930s, and a short distance downstream, beyond the Aventine, can still be seen part of the *Porticus Aemilia*, a unique example of vaulted warehouses of the 2nd century B.C. Nearby is the site of the marble yards and behind it Monte Testaccio, an artificial hill 150 ft. (46 m.) high, composed entirely of broken fragments of the jars used for transporting grain, wine, and oil to the capital.

ALINARI

RUINS OF THE BASILICA ULPIA, IN THE FORUM OF TRAJAN, WITH TRAJAN'S COLUMN. IN THE BACKGROUND, THE CHURCHES OF (LEFT) SANTA MARIA DI LORETO, BEGUN ABOUT 1507, AND (RIGHT) SANTA NOME DI MARIA, 1738

Proceeding northward up the Via del Teatro di Marcello one passes the handsome travertine facade of the *Theatre of Marcellus*, built by Augustus and named after his nephew and heir, who died in 23 B.C. It owes its preservation to having been turned by the Savelli family into a fortress, later converted into the Palazzo Orsini, which still occupies the interior. Immediately beyond it are the re-erected marble columns of the *Temple of Apollo*. A temple of this dedication had stood here or hereabout since 431 B.C., but the visible remains are entirely those of the Augustan restoration of about 20 B.C., which is notable for the virtuosity of its ornament, the work of Greek craftsmen.

Circus Flaminius.—Beyond this point, occupying the low-lying ground in the bend of the river, lay the districts of the Cir-

cus Flaminius and the Campus Martius. The former area took its name from the stadium that was built in 220 B.C. on the site later occupied by the medieval ghetto. The principal Roman buildings still visible are the entrance to the *Porticus Octaviae* and the temples of the Largo Argentina. The former, a porticoed enclosure with a public library, was built by Augustus' sister, Octavia, replacing an earlier building, the Porticus Metelli of 146 B.C. Within it stood temples of Jupiter and of Juno. The entrance is a Severan restoration (A.D. 203). The sacred area of the *Largo Argentina,* excavated between 1926 and 1929, consists of a group of four small temples, three rectangular and one circular, which in their present form date from the 2nd and 1st centuries B.C. and which survived with only minor alterations throughout the Imperial period. The dedications are not known. Behind them, to the west, lay the *Theatre of Pompey,* the first permanent theatre in Rome (55 B.C.), considerable remains of which survive incorporated in the houses to the east of the Campo dei Fiori. Scanty traces of the Augustan *Theatre of Balbus* (13 B.C.) have been identified beneath the Palazzo Mattei di Paganica.

ROBERT BRIGHT—RAPHO GUILLUMETTE

THE THEATRE OF MARCELLUS, COMPLETED IN 13 B.C. BY AUGUSTUS

Campus Martius.—The Campus Martius, though public property from a very early date, was still open and in places swampy ground right down to the time of Augustus, when it was drained and laid out as a new monumental quarter by Agrippa (d. 12 B.C.). Though few of the actual Agrippan buildings survived the fire of A.D. 80, the quarter retained its monumental character throughout antiquity. In the Middle Ages, when the inhabited centre of the city shifted to the lower ground by the river, most of the Roman buildings were destroyed. The principal surviving monument is the *Pantheon,* which owes its preservation to its rededication as a church in A.D. 609. Nothing remains of Agrippa's building except the dedication, the present structure being entirely the work of Hadrian. The pedimental porch, with its bronze roof beams and gilded bronze tiles (removed in 1625 to provide bronze for Bernini's canopy in St. Peter's) and its gigantic columns of Egyptian granite weighing about 60 tons, is grandiose but conventional. On the other hand the body of the building, an enormous circular space lit solely by the light that floods in through the oculus at the centre of the dome, was revolutionary in design, possibly the first of the great buildings of antiquity to be designed exclusively as an interior. It was also a remarkable feat of engineering, the dome (141 ft. [43 m.] in diameter) being the largest ever built until modern times. Two things made this possible—the magnificent quality of the mortar used in the concrete and the very careful selection and grading of the aggregate, which ranges from basalt in the foundations and lower part of the drum, through brick and tufa, to the lightest of pumice toward the centre of the vault. The brickwork outer facing of the drum is divided into three zones, the uppermost of which corresponds with the lower part of the dome and helps to contain the thrust. Contrary to common belief it is only in this lowest part of the dome that there is any use of brick ribbing. The interior, with its rich marbling and uniform lighting, conveys better than any other surviving monument the sense of colour, light, and space which was the architectural objective of these great Roman concrete interiors.

Adjoining the Pantheon were *Agrippa's Baths,* the first of the great public bath buildings of Rome. Surviving buildings in the Campus Martius include the shattered drum of the *Mausoleum of Augustus* and, re-erected beside it, the *Ara Pacis* (13–9 B.C.), which stood beside the Via Flaminia at the corner of the modern Via in Lucina. The *Column of Marcus Aurelius* (dedicated A.D. 193) stands in the Piazza Colonna; it was modeled on Trajan's column and depicts the emperor's Danubian campaigns. Much of the *Temple of Hadrian* can be seen incorporated into the Borsa, the stock exchange, and on the opposite bank of the Tiber is the *Mausoleum of Hadrian,* converted in the Middle Ages into the fortress of Castel S. Angelo. Much of the Egyptian sculpture in the Vatican and other museums and several of the smaller Egyptian obelisks come from the destroyed *sanctuary of Isis and Sarapis* near the Collegio Romano, and the obelisk now in the Piazza di Montecitorio was the pointer of the monumental sundial erected by Augustus near the Ara Pacis. The Piazza Navona preserves the shape and much of the structure of the *Circus of Domitian.* Wholly or partly surviving Roman bridges are the Pons Fabricius (62 B.C.), the Pons Aelius, now Ponte S. Angelo (A.D. 134), the fragmentary Pons Aemilius, or Ponte Rotto (179–142 B.C.), and some distance upstream the Pons Milvius (109 B.C.).

11. The Aventine, Quirinal, Esquiline, and Caelian Hills.—The line of the Servian Wall shows that by the 4th century B.C. the city had come to include almost the whole of the Aventine Hill and large parts of the Quirinal, Esquiline, and Caelian hills. The building of the first high-level aqueduct in the 2nd century B.C. (Aqua Marcia, 144 B.C.) made possible the development also of the higher ground beyond, later enclosed by the Walls of Aurelian. Within the first of these areas lay the most populous quarters of the Republican city and several of its most venerable shrines. The outer periphery was largely occupied by the parks and ornamental gardens of the wealthy, which by the end of the Republican period extended in an almost unbroken ring around the city, very much in the manner of the "villas" of 18th-century Rome. During the Empire many of these properties passed to the emperors and were used for the building of large monuments for which there was now little room in the crowded city centre.

Most of the Republican monuments, including the great Temple of Diana on the Aventine, were rebuilt or swept away in the successive fires that devastated the old quarters. The great fire of A.D. 64 was made by Nero the occasion for expropriating an area of over 200 ac. (81 ha.) in the heart of the city for the construction of the *Golden House.* He had already planned and begun an earlier palace, the Domus Transitoria, which was to link the existing buildings on the Palatine with the gardens of Maecenas and other Imperial properties on the Esquiline and adjoining hills. To these he now added a large part of the Caelian and Oppian hills and the valley between them and the Palatine, extending to the Servian Wall in one direction and to the high ground followed by the modern Via Lanza in the other. This whole area he laid out as parkland with porticoes, pavilions, and fountains, the centrepiece being an artificial lake on the site later occupied by the Colosseum. At the east end of the Forum the slopes of the Velia were remodeled to form a grandiose colonnaded approach and vestibule, within which stood a colossal gilded bronze statue of Nero, 120 ft. (37 m.) high. The domestic wing stood on the slopes of the Oppian Hill, facing south across the lake. Sadly little has survived of the sumptuous paintings and stuccoes which inspired the "grotesque" style of Raphael and his followers (so called from the "grotte" or caverns which were all that was then visible). But the building itself, which has since been excavated, is important as representing the first recorded monumental expression of the new architectural ideas that were to transform the face of Roman architecture under Domitian, Trajan, and Hadrian.

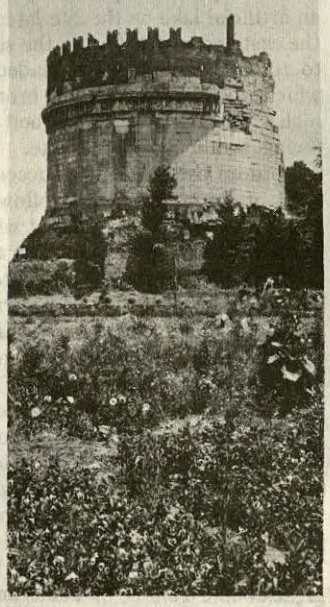
The expropriations involved in the creation of the Golden House were deeply resented, and Nero's successors hastened to put large parts of it to public use. The domestic wing owes its preservation to its incorporation within the foundations of the *Baths of Trajan,* the ruins of which are now laid out as a public garden (Parco Oppio). The *Temple of Claudius,* partly dismantled by Nero, was completed by Vespasian; part of the arcaded facade of the platform can be seen beside the Church of SS. Giovanni e Paolo. The vestibule was swept away by Hadrian to make way for his great double Temple of Venus and Rome, and the lake was drained and its place taken by the *Colosseum.* This gigantic amphitheatre, more correctly known as the Amphitheatrum Flavium, measured 615 by 415 ft. (187 by 126 m.) externally. Begun by Vespasian and inaugurated by Titus in A.D. 80, it was used for hunts, sham battles, and gladiatorial shows, and the arena could be flooded for

naval displays. The facade consists of three superimposed series of 80 arches and an attic story, rising to a total height of 160 ft. (49 m.). Together with the rest of the main structural framework of the building, the facade is of travertine, the secondary walls being of tufa, and the vaulting of the arcades and the inner bowl of concrete. All that survives of Hadrian's *Temple of Venus and Rome* is the platform, the surviving superstructure being the work of Maxentius. It was decastyle and almost certainly the largest temple in the city. Nearby stands the fine *Arch of Constantine.* Erected hastily to celebrate Constantine's victory over Maxentius in A.D. 312, it incorporates sculpture from many earlier buildings, including part of a battle frieze and figures of prisoners from the Forum of Trajan, a series of Hadrianic roundels, and a set of eight panels from a monument of Marcus Aurelius.

Parts of Caracalla's great *Temple of Sarapis,* which occupied the site of the Colonna Gardens and the Gregorian University on the edge of the Quirinal Hill, were still standing until demolished about 1630. Of Aurelian's *Temple of the Sun,* near the Piazza S. Silvestro, nothing is now visible. Generally speaking, however, few of the main public sanctuaries lay outside the ancient centre and the Campus Martius. There were, on the other hand, many private cult buildings, notably of the cult of Mithra, of which the two finest examples now visible lie beneath the churches of S. Clemente and Sta. Prisca respectively. A sanctuary dedicated to the Syrian gods was excavated in 1908 on the Janiculum, and another to the Syrian Jupiter Dolichenus (A.D. 138) in 1935 on the Aventine. A remarkable subterranean basilica found in 1917 just outside the Porta Maggiore had been suppressed, dismantled, and filled in soon after its construction in the mid-1st century A.D. Its splendidly preserved stuccoes show it to have belonged to a neo-Pythagorean sect.

Of the many private houses of the wealthy found when the higher ground of the city was being developed in the Renaissance and again in the decades following 1870, very little has survived. Exceptions are the *Palace of the Gardens of Sallust* and the so-called *Temple of Minerva Medica,* in reality a 3rd-century domed pavilion of the gardens of the emperor Gallienus (A.D. 253–268). Of the several barrack buildings, the outer wall of the camp of the Praetorian Guard, established by Tiberius, is still largely intact, incorporated into the Walls of Aurelian. When the Praetorians were disbanded and reorganized by Septimius Severus their place as the emperor's household troops was taken by the Equites Singulares, parts of whose camp, including the commandant's house, are preserved beneath the Church of St. John Lateran.

The most impressive remains of the outlying quarters are those of the great baths, which played such an important part in the daily life of Romans of all classes. The *Baths of Caracalla* covered an area of over 6 ac. (2.4 ha.) at the foot of the Aventine. The plan, derived with modifications from that of Trajan's baths, consists of the baths proper, surrounded by a garden, which is in turn enclosed by a rectangular outer precinct containing suites of lecture halls, libraries, clubrooms, and other social facilities, as well as the vast cisterns that served the baths. The bath building is a huge, rectangular concrete structure which still stands in many places to vault height. Across the shorter axis lay the swimming pool (*natatio*), cold hall (*frigidarium*), warm room (*tepidarium*), and main hot room (*caldarium*), and symmetrically disposed to right and left were the changing rooms, gymnasia, smaller heated rooms, service rooms, etc.



ALINARI

TOMB OF CAECILIA METELLA, ALONG THE VIA APPIA, BUILT ABOUT 20 B.C. WREATHS OF FLOWERS AND OX SKULLS DECORATE THE MARBLE FRIEZE BELOW THE CORNICE

The plan, with its ingenious heating installations and arrangements for water supply and drainage, is one that was repeated many times both in Rome and the provinces. In Rome it appears again in the *Baths of Diocletian,* the great central hall of which, as finally converted by L. Vanvitelli into the Church of Sta. Maria degli Angeli, gives an excellent idea of the architectural intentions of these huge enclosed spaces before they were stripped of the marbles and mosaics that gave them light and colour. (*See* also BATH.)

12. Cemeteries.—Beyond the city limits, beside every road leading out of Rome, lay tombs and funerary monuments of every size. The best known of these cemeteries is that which extends for miles beside the Via Appia, which includes such familiar monuments as the tomb of Caecilia Metella, the drumlike mass of which served in the Middle Ages as a fortress of the Caetani family; the Mausoleum and Circus of Maxentius (A.D. 306–312); and the family tomb of the Scipios, as well as several of the earliest Christian catacombs (*q.v.*). The cemetery beneath St. Peter's (*see* PETER, SAINT) illustrates a type of middle-class mausoleum, faced with brick, which was very common in the 2nd and 3rd centuries A.D. Other well-preserved examples, with fine stuccoes and paintings, are those beside the Via Latina. To the same category of Imperial mausoleums as the tomb of Maxentius belong those of the Gordians beside the Via Praenestina and that of Helena, mother of Constantine ("Tor Pignattara"), beside the Via Casilina. Among the more eccentric tombs are the early Augustan Pyramid of Cestius, beside the Porta S. Paolo, and the slightly earlier tomb of the baker Eurysaces outside the Porta Maggiore.

B. Medieval Rome

With the transfer of the effective capital of the Empire from Rome to Constantinople, the great program of civil building came to an abrupt end. Apart from ecclesiastical architecture, the 1,100 years that followed Constantine were for the city of Rome a period of slow but steady decline, punctuated by fire, earthquake, and, particularly after the Edict of Theodosius in 391, the destruction of ancient buildings for their materials. As the population dwindled (estimated at 30,000–35,000 between the 10th and the 14th centuries) and as the aqueducts fell into disrepair, increasingly large areas of the higher ground within the city walls were abandoned, until by the later Middle Ages the population was concentrated very largely in the well-watered lower ground on either side of the river, in the Campus Martius, near the Vatican, and in Trastevere. Despite the laying out of new streets and quarters in the late 15th and early 16th centuries, it was not until the pontificate of Sixtus V (1585–90) that Rome began seriously once more to expand, and as late as 1870 the distribution of population still reflected the medieval rather than the classical pattern.

In contrast to most of western Europe, the lowest point of Rome's fortunes fell late rather than early within the Middle Ages, during the anarchy of the 10th and early 11th centuries and again at the time of the Avignon schism in the 14th century. Theodoric is the last ruler recorded as having systematically restored the classical monuments, although many were seen and recorded, still substantially intact, by the early pilgrims from the north several centuries later. After the 9th century the destruction was rapid. Of the buildings that have survived, many, such as the Pantheon, the Senate House (S. Adriano), and the temples of the Forum Boarium, owe their survival to their consecration as churches; others, such as the Colosseum, the Theatre of Marcellus, and the Mausoleum of Hadrian (Castel S. Angelo), remain because they were converted into the private fortresses of the warring nobility. The rest fell into ruin and were ruthlessly quarried by the builders of the Middle Ages and the Renaissance.

1. Ecclesiastical Architecture.—*Early Christian.*—It was only in the field of ecclesiastical building that there was almost continuous activity throughout the Middle Ages. The pattern was firmly established by Constantine immediately after the Edict of Milan in 313. Before this date there was no monumental Christian architecture. The meeting places of the early Christian commu-

nity had been private houses, many of which were subsequently converted into churches, a notable surviving example being that beneath the early 5th-century church of SS. Giovanni e Paolo. Of more immediate importance, however, than these modest urban *tituli*, the equivalent of the later parish churches, were a number of monumental new foundations on the periphery of the city. A few, such as the new cathedral church and papal residence of St. John Lateran, lay just inside the walls, but the majority were martyr shrines, established outside the city limits over the burial places of the early martyrs. In course of time, as large new churches were founded in the heart of the city (Sta. Maria Maggiore, *c.* 432, is one of the earliest) and as outlying buildings were abandoned because of the increasing insecurity of the countryside, these distinctions became blurred. But in the 4th century, during the early, formative years of Christian architecture, it was the cathedral church of Rome and the great martyr shrines which established the models that were to be followed by ecclesiastical builders in the West for many centuries to come. Many of them, such as St. Paul's Outside the Walls, S. Lorenzo al Verano (S. Lorenzo Outside the Walls), and S. Sebastiano, survived to become important features of the medieval and post-medieval urban redevelopment of Rome itself. The outstanding example of this was Constantine's great Church of St. Peter in the Vatican; the proximity of the fortress of Castel S. Angelo led to the Vatican's becoming the preferred residence of the pope; and so it and St. Peter's usurped much of the position and prestige that would otherwise have belonged to the cathedral church and the Lateran Palace.

The Lateran Palace was presented by Constantine to Pope Miltiades, and beside it, over the remains of the Severan barracks of the Equites Singulares, Constantine built the first of the great Christian basilicas, the cathedral church now known as St. John Lateran. The plan was that of a five-aisled basilica, 320 by 170 ft. (98 by 52 m.) internally, with a single western apse and two transept-like chapels projecting slightly from the western ends of the two outer aisles. The baptistery, originally an adapted part of the palace bath suite, dates from 432–440, with mosaics and intarsias of the 5th and 7th centuries. The cloister (1222–30) is a fine example of Cosmati work. The interior of the church was entirely transformed (1646–50) by Borromini.

The basilica of St. Paul's Outside the Walls (390 by 195 ft. [119 by 59 m.]) was begun in 386, replacing a smaller Constantinian church. As at St. Peter's, the latter had been built over a cemetery of the 1st–3rd centuries A.D., within which was the traditional burial place of the apostle. Faithfully restored after a fire in 1823, it is the outstanding surviving example of 4th-century basilical architecture, with a single eastern apse, a lofty transept, and five majestic nave aisles. Noteworthy later additions are the cloister (about 1200), the 12th-century Easter candlestick, and Arnolfo di Cambio's altar canopy (1285).

A controversial group of early 4th-century basilicas in the shape of a classical circus, with an apse the full width of the three-aisled nave (S. Sebastiano, S. Lorenzo al Verano, S. Agnese Outside the Walls, Tor Pignattara), appears to have originated as communal burial places associated with martyr shrines. The two last-named incorporated Imperial mausoleums, of which that later dedicated to Sta. Costanza marks an important stage in the development of a centrally planned Christian architecture and contains a superb series of contemporary vault mosaics, largely pagan in character. The porphyry sarcophagi from Sta. Costanza and Tor Pignattara are now in the Vatican Museum. The Church of Sta. Pudenziana preserves its original 4th-century apse mosaic, much restored.

5th–9th Centuries.—The surviving churches of the period from the 5th to 8th centuries are very varied in character and inspiration. An important early 5th-century group is predominantly Roman in inspiration. It includes SS. Giovanni e Paolo (about 400, replacing and in part incorporating an earlier house church), S. Vitale (416), and Sta. Sabina (about 430), with its original carved wooden doors. It includes also the foundations of Sixtus III (432–440): Sta. Maria Maggiore, the first great church of the Virgin in Rome, founded immediately after the Council of Ephesus and containing a magnificent series of contemporary mosaics; S. Pietro in Vincoli; S. Lorenzo in Lucina; and the Lateran baptistery. The great circular church of S. Stefano Rotondo (468–483) probably reflects the influence of the Church of the Holy Sepulchre (Anastasis) in Jerusalem.

Greek influence is apparent in the earlier church of S. Clemente (before 532), the chancel screens of which, now in the upper church, are Constantinopolitan work; in the galleried naves of S. Agnese (625–638) and of the earlier Church of S. Lorenzo al Verano (579–590), and in the remarkable 7th-century paintings of Sta. Maria Antiqua, the work of Greek refugees from the iconoclastic movement. Other good mosaics of the period are those of SS. Cosma e Damiano (526–530), Sta. Sabina, S. Lorenzo al Verano, and S. Agnese. (*See* also EARLY CHRISTIAN ARCHITECTURE.)

The years immediately before and the half-century after Charlemagne's consecration in St. Peter's on Christmas Day, 800, were a period of great building activity, much of it deliberately based on Early Christian models. This archaizing tendency is already felt in the buildings of Pope Adrian I (772–795), parts of which survive in Sta. Maria in Cosmedin and in S. Giovanni a Porta Latina, and of Leo III (795–816) in S. Stefano degli Abissini and SS. Nereo e Achilleo. It is unusually clear in Sta. Prassede, where the transept, the anular crypt, the horizontal architrave, and the quadrangular atrium are all patently copied from St. Peter's. Sta. Prassede, which contains a magnificent cycle of contemporary mosaics in the church itself and in the annexed chapel of S. Zeno, was the work of Paschal I (817–824), who also built Sta. Maria in Domnica and rebuilt Sta. Cecilia. To the next 30 years belong S. Giorgio in Velabro and the apse of S. Marco (both 827–844), the exterior of S. Martino ai Monti (844–847), the nucleus of SS. Quattro Coronati (847–855), including the entrance tower, and probably Sta. Maria Nova (Sta. Francesca Romana), replacing Sta. Maria Antiqua which had been destroyed by earthquake in 847. Other well-preserved mosaics of the period are in S. Marco, Sta. Maria in Domnica, and SS. Nereo e Achilleo.

Romanesque.—The two centuries that followed were a period of weakness and dissension that saw little except the essential maintenance of existing buildings; an exception is S. Bartolomeo all'Isola, built shortly before 1000 by the emperor Otto III. The reestablishment of papal authority by Gregory VII (1073–85) was followed by a great deal of building and rebuilding. Good early examples of Romanesque architecture in Rome are Sta. Prisca and S. Saba, both *c.* 1100; S. Clemente, rebuilt after the Norman sack of 1084; and S. Crisogono, 1122. To the 12th century belongs most of what is now seen in SS. Quattro Coronati and Sta. Maria in Cosmedin and, a notable example of the classicizing tendencies at work, Sta. Maria in Trastevere; to the 13th, the nave of S. Lorenzo al Verano, the apse and the transept of Sta. Maria Maggiore, and the main structure of Sta. Maria in Aracoeli, a Franciscan church of about 1250. Many of these Romanesque churches had slender brick campaniles, those of Sta. Maria in Cosmedin and Sta. Francesca Romana being typical of the 40 or so that survive and of many others now destroyed.

Another characteristic feature is the carved and inlaid decoration carried out by the Roman marble workers often known as the Cosmati (*q.v.*), the name of one of the most active of several families of traditional craftsmen. They specialized in mosaic pavements and intarsia, using porphyries and marbles robbed from classical buildings (and in their later work glass paste) and frequently copying classical motifs. Architecturally notable examples of Cosmati work are the porch of S. Lorenzo al Verano and the cloisters of S. Cosimato, St. John Lateran, St. Paul's Outside the Walls, and SS. Quattro Coronati. There are innumerable fine pavements (*e.g.*, Sta. Maria in Aracoeli, S. Clemente, Sta. Maria in Cosmedin) and fittings such as pulpits, choir screens, bishop's thrones, and Easter candlesticks (*e.g.*, S. Clemente, S. Lorenzo al Verano, SS. Nereo e Achilleo). There are good Romanesque mosaics in Sta. Maria in Trastevere (apse, 1140; panels by P. Cavallini, about 1300), S. Clemente (12th century), Sta. Francesca Romana (1160), and Sta. Maria Maggiore (apse, 1295). Paintings of the period include S. Giovanni a Porta Latina (consecrated 1191), the chapel of S. Silvestro in SS. Quattro Coronati (13th century), and the

magnificent remains of a "Last Judgment" by Cavallini (*c.* 1293) in Sta. Cecilia.

End of the Middle Ages.—The century of the Great Schism saw no new building in Rome, and the only Gothic church, Sta. Maria sopra Minerva, begun by the Dominicans in 1280, was not completed until the 15th century. The plan is closely modeled on that of Sta. Maria Novella in Florence. It is only in such features as tombs, tabernacles, and altar canopies that the influence of Italian Gothic is strong, introduced from Tuscany by artists such as Arnolfo di Cambio, creator of the tomb of Boniface VIII in the Vatican Grottoes, and of the altar canopy in St. Paul's Outside the Walls.

2. Secular Architecture.—Of the secular architecture of medieval Rome, the only substantial remains are those of a number of tower fortresses, notably the Torre delle Milizie, the Tor dei Conti, and the so-called Casa di Crescenzio. Nothing remains of the medieval Senator's Palace, the building of which soon after 1143 on the site of the ancient Tabularium established the Capitoline Hill thereafter as the seat of municipal government. The great steps of Sta. Maria in Aracoeli were built in 1348 as a thank offering after a plague.

(J. B. W.-P.)

C. Renaissance and Modern Rome

1. Early and High Renaissance.—By the early 15th century, artistic patronage in Rome had reached a very low ebb, owing to the prolonged struggles over papal elections during the Schism and to the deserted state of the city during the exile in Avignon. After the return of the papacy to Rome with Martin V (1417–31) a start was made with the restoration of some of the main churches; fresco cycles for the Lateran were commissioned from Gentile da Fabriano and Pisanello (both works have now disappeared), and Masolino was commissioned by Cardinal Branda Castiglione to decorate a chapel in S. Clemente with frescoes. Eugenius IV (1431–47) commissioned from Filarete the great bronze doors of St. Peter's (1433–45).

During the reign of the humanist pope Nicholas V the walls of the city—the old Roman Aurelian Wall on which the greatly shrunken city, now reduced to a few small congested centres amid vineyards and vast tracts of abandoned wilderness, still relied for defense—were repaired, and a start was made on clearing blocked roads, restoring the 40 pilgrimage churches, and renewing fountains (in particular what is now the Trevi Fountain, fed by the Acqua Vergine, the only aqueduct to survive the destructions of the Goths). Fra Angelico painted two chapels in the Vatican, one of which is now lost; the other was Nicholas' private chapel. Alberti was concerned in a large project for rebuilding, probably in the Borgo. Nicholas also brought Bernardo Rossellino to Rome to build a new choir onto the Early Christian basilica of St. Peter's, the uncompleted parts of which later had considerable bearing on the plans for the new basilica drawn up by Bramante at the beginning of the 16th century. The three-story Benediction Loggia added to the front of old St. Peter's during the pontificate of Pius II (the humanist

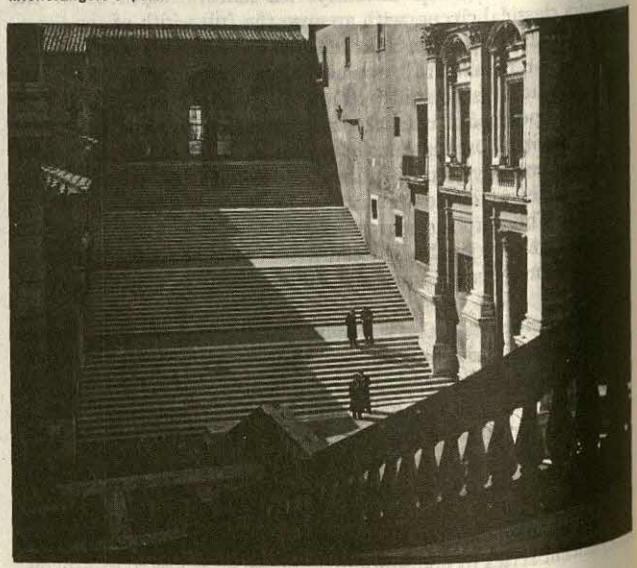
(Left) 2nd-century bronze statue of Marcus Aurelius in the centre of the piazza. (Below) One of two identical stairways behind the museum and the conservatory leading to triple-arched colonnades. Both were erected in the 16th century by Giacomo da Vignola to complete Michelangelo's plan



Aeneas Silvius Piccolomini) may have been by Alberti, and is the first Renaissance use of superimposed arcades of the type of the Theatre of Marcellus or the Colosseum (the loggia is lost, but drawings of it survive).

The Palazzo Venezia, which incorporates the Early Christian basilica of S. Marco, was begun in 1455 by Cardinal Pietro Barbo, and enlarged from 1465, after his election as Paul II, when it was used as a papal residence. The large loggia of superimposed arcades in the courtyard, built during his pontificate, is the first domestic use of the antique prototype used in the Benediction Loggia. This grim, fortresslike palace, with its huge tower, was much altered from the 18th century onward, particularly during the years when it served as Mussolini's headquarters.

The Cancelleria, originally built as a residence by Cardinal Raffaello Riario, was begun possibly as early as the 1480s, which rules out any attribution to Bramante, who did not arrive in Rome until after 1499. In painting, the major works of the latter part of the 15th century were the fresco cycles of the "Lives of Moses and Christ" on the upper part of the walls of the Sistine Chapel in the Vatican (built by Sixtus IV, during 1473–84), commissioned in 1481 from Florentine and Umbrian masters of whom the chief were Cosimo Roselli, Botticelli, Ghirlandajo, and Perugino. Perugino had the major part, but only one of his works there survives, the limpid and harmonious "Charge to St. Peter," the others having been destroyed in 1536 to make room for Michelangelo's "Last Judgment."

Between 1492 and 1495, Pinturicchio decorated for Alexander VI the six rooms of the Appartamento Borgia, but despite their charm and their highly involved symbolism and imagery they form but a slight prelude to the grand and significant works created in the rooms above—the "Stanze"—during the pontificate of Julius II. Bramante's designs for the new St. Peter's, the Vatican Palace, and the Belvedere courtyard, Raphael's "Stanze," Michelangelo's Sistine ceiling, and his abortive projects for the Julius Tomb were all created for this magnificent and imperious patron.

The superb intellectual and artistic high-water mark of High Renaissance was reached with Bramante's tiny Tempietto in the courtyard of S. Pietro in Montorio (1502), on the traditional site of the martyrdom of St. Peter, and his cloister in Sta. Maria della Pace (1504); with Michelangelo's "Pietà" now in St. Peter's (1498–99); and with a handful of works by Raphael, such as the decorations in the Villa Farnesina (*c.* 1518), the tapestries for the Sistine Chapel (1515–16; in the Pinacoteca Vaticana), and the Chigi Chapel (1516) in Sta. Maria del Popolo. The period broke up with the dearth of patronage, the dispersal of artists after the disastrous sack of Rome in 1527, the evolution of Mannerism, and the concentration of all artistic interest in the work and personality of Michelangelo, who dominated all the arts until his death in 1564 and for another quarter-century thereafter. (*See* also Renaissance Architecture.)

2. Late Renaissance.—Baldassare Peruzzi, who created one of the first purely illusionistic painted decorations in Rome in the Farnesina (1509–21), built the Palazzo Massimo alle Colonne (1535); while the principal architectural works, St. Peter's and the Farnese Palace, were in the hands of Antonio da Sangallo the younger until his death in 1546, when he was succeeded by Michelangelo (*q.v.*). In the Vatican, the "Last Judgment" in the Sistine Chapel (1536–41) and the two frescoes in the Cappella Paolina (1542–50), both executed for Paul III (Farnese), were Michelangelo's last works in painting. From Jan. 1, 1547, when he was appointed to direct the works at St. Peter's, Michelangelo returned to Bramante's idea of the central plan, from which his successors had departed under pressure from the clergy who desired a long-nave church for liturgical reasons. The dome, designed as a hemisphere, was built after Michelangelo's death in a more conical form by his pupil Giacomo della Porta, and Domenico Fontana, and his central plan was eventually frustrated by Maderno's addition of a long nave to his unfinished east end (the orientation of St. Peter's reverses the normal). His other architectural works include the upper story and entrance of the Palazzo Farnese and the redesigning of the Capitol, which involved a reconstruction of the Palazzo Senatorio and the building of the two palaces (Palazzo dei Conservatori and Palazzo Capitolino) flanking it.

To Giacomo da Vignola is due the introduction of the oval plan at S. Andrea in the Via Flaminia (completed 1554) and Sta. Anna dei Palafrenieri (*c.* 1572), both extremely influential for the development of this form during the Baroque period. B. Ammanati, with G. Vasari and Vignola, built the Villa Giulia for Julius III (1550–55; now the Etruscan Museum), with its contrast between interior and exterior facades and its delightful sunken water garden, or nymphaeum. Vignola began the mother church of the Jesuit order, the Gesù, in 1568 (finished after his death by Giacomo della Porta), returning to the long-nave form with deep side chapels instead of aisles, but its projected simplicity and bareness was later overlaid by an exuberant illusionistic decoration in fresco and stucco by Baciccio (1683). Vignola's *oeuvre* was dominated by his desire to return to the simplicity and clarity of Bramante and by his veneration for the antique, expressed in his book, *Regola delli cinque ordini d'architettura* (1562), which was of vital importance outside, as well as inside, Italy.

The end of the century, which saw this extinction of the wayward individualism of Mannerism in favour of an academic strictness of canon, also saw the development of a parallel movement in painting, given final form in the frescoes of the Farnese Gallery (1597–1604) by Annibale Carracci. This sole competitor in Rome in size and splendour to the "Stanze," the Sistine ceiling, and the Farnesina decorations—and owing a good deal to the last two—blends brilliant illusionism with a return to the clarity and firmness of the High Renaissance, a renewed consciousness of the antique, and a robust sense of humour. Its vigour extinguished the debilitated survivals of Mannerism, such as the Cavaliere d'Arpino's feeble mosaic decorations in the dome of St. Peter's, and encouraged the flights of illusionistic fantasy of G. Lanfranco's dome of S. Andrea della Valle (1621–25) and apse of S. Carlo ai Catinari.

Parallel with the Carracci's revival of lucidity and simplicity came Caravaggio's revolt of naturalism. His stormy career (1573–1610) matches his strong effects of light and shadow, unidealized models, uncomplicated imagery, and direct technical methods in oil painting, all of which are present in his Contarelli Chapel paintings in S. Luigi dei Francesi (1597–*c.* 1603) and his Cerasi Chapel in Sta. Maria del Popolo (1600–01); but his influence was felt more in northern Europe and Naples than in Rome itself.

The transformation of a still largely medieval city into modern Rome began with the vast building program started by Sixtus V (1585–90). With his architect Domenico Fontana, he laid the basis of the modern street plan by driving new streets through the city, the chief of which were those from the Vatican to the Lateran, and to Sta. Maria Maggiore, and the Via Felice from the Lateran via Sta. Maria Maggiore to the Piazza del Popolo, across the Quirinal Hill. Sixtus also laid out new squares in front of Sta. Maria Maggiore and the Lateran; rebuilt the palace there, at the Quirinal, and the Vatican; restored the aqueduct of the Acqua Felice to bring water to the higher parts of the city and rebuilt many fountains; raised the obelisks in front of St. Peter's, the Lateran, Sta. Maria Maggiore, and Sta. Maria del Popolo; placed the antique statues of the Dioscuri in front of the Quirinal Palace; built the Vatican Library; and completed the dome of St. Peter's. Fortunately, his project to convert the Colosseum into a wool factory, to provide honest employment for the prostitutes of Rome, came to nothing.

3. Baroque.—The Baroque, that characteristic and predominantly Roman style, opens with C. Maderno's imaginative, vigorous, and lucid facade for Sta. Susanna (finished 1603) and with his completion of St. Peter's, to which he added the long nave and a rather consciously imposing facade. He also began the Barberini Palace (now the National Gallery) in 1628 but was succeeded in this, on his death in 1629, by Bernini, who then had Borromini as an assistant.

This brought the two major exponents of High Baroque on to the architectural scene at virtually the same moment, although Bernini as a sculptor had already achieved great fame through his statues for Cardinal Scipione Borghese (now in the Borghese Gallery), in which he established the principles governing the new

HENRI CARTIER-BRESSON—MAGNUM

SHOPPERS ON THE PIAZZA NAVONA. ON THE RIGHT, THE CHURCH OF S. AGNESE DESIGNED BY BORROMINI, 1652, AND, FACING IT, BERNINI'S "FOUNTAIN OF THE RIVERS"

style and demonstrated his legendary technical accomplishment. For his great patron, the Barberini pope Urban VIII, he created in St. Peter's the Baldacchino (1624–33), the Loggie and the niches under the dome (1629 onward) with their gigantic statues (of the figures, only the "Longinus" is by Bernini himself, the others being by F. Duquesnoy, F. Mochi, and A. Bolgi), and the tomb of Urban in one of the apse niches. He also completed Maderno's exterior with the vast colonnaded piazza (1656–67). It was also Bernini who rebuilt the Scala Regia as a new grand entrance to the Vatican, placing his statue of the "Vision of Constantine" at the point of intersection of church and palace, and made the tomb of Alexander VII (1671–78).

Bernini's "Ecstasy of St. Theresa" in the Cornaro Chapel in Sta. Maria della Vittoria (1645–52) is the most complete exposition of Baroque grand decoration, using coloured and white marble, gilded bronze, and the light itself, filtered through a yellow-paned window, to create an overwhelming emotional impact. Similar use of light and mixed media characterize his "Cathedra Petri" in the apse of St. Peter's. Through his fountains—the "Triton" near the Barberini Palace, the "Fountain of the Rivers," and "Fountain of the Moor," in the Piazza Navona, are his most celebrated—his poignant "Angels of the Passion" for the Ponte S. Angelo, and his amusing elephant-borne obelisk behind the Pantheon, he contributed as much to the splendour of the city as to its amenity and significance.

Borromini's architecture, more subtle, delicate, less dependent on decoration, makes its impact through its interplay of architectural forms and its deliberate counterpoint of void and solid, concave and convex curves, and involved interlockings of different spatial rhythms. His first church, S. Carlo alle Quattro Fontane, begun in 1634, the facade of which was his last work before his suicide in 1667, established him as a master of flowing line and profound sensibility. S. Ivo della Sapienza (begun 1642) shows him creating entirely novel virtuoso effects on a star-shaped ground plan of great complexity and daring. In S. Agnese in Piazza Navona, the Propaganda Fide College, the Oratory of St. Philip Neri, and S. Andrea delle Fratte, he enriched architecture with new forms, using only the most restrained decoration.

The counterpart to Bernini in painting was Pietro da Cortona, whose vast, congested, and rather harshly coloured "Allegory of Divine Providence" decorates the ceiling of the *salone* of the Barberini Palace. In architecture, his works are of a more restrained magnificence—SS. Luca e Martina (1635–50) contrasts in its simple Greek cross ground plan with Borromini's more complex spatial rhythms, and in the purity of its plain stone with Bernini's lavish use of colour. The extreme of illusionistic decoration was reached in Baciccio's ceiling and apse of the Gesù and in Andrea Pozzo's vertiginous perspective fantasies in S. Ignazio (1691–94).

A classical reaction to Bernini's exuberance of style existed in A. Sacchi and C. Maratti, but it found its principal exponents not in Italians but in the expatriate Frenchmen Poussin and Claude. In sculpture, Bernini's rival A. Algardi worked in a barely more restrained style, and the Fleming Duquesnoy pursued a purely personal style influenced as much by his friend Rubens as by contemporary Italian sculpture.

Before the Neoclassical reaction against Bernini's spectacular art finally seized the Baroque, the subdued Roman version of Rococo had a brief day. It is displayed in the church of Sta. Maria Maddalena finished by G. Sardi in 1735, in the portions of the Palazzo Doria built by G. Valvassori (*c.* 1734), and in the Spanish Steps by Francesco de Sanctis (1725). The grand and rather exhibitionist set piece of Late Baroque can be seen in A. Galilei's Lateran facade (1732–36), F. Fuga's facade of Sta. Maria Maggiore (1741–43), D. Gregorini and P. Passalacqua's gigantic facade for Sta. Croce in Gerusalemme (1743), and N. Salvi's Trevi Fountain (completed in 1762). (*See* also BAROQUE AND POST-BAROQUE ARCHITECTURE; BAROQUE ART.)

4. Neoclassicism.—Neoclassicism was born of the ideas emanating from Winckelmann's thesis of the supremacy of classical, and above all Greek, art and was translated into painting by A. R. Mengs, in his "Parnassus" (Villa Albani-Torlonia, 1761). In its frigid mixture of motives derived from the antique, Raphael, and the 17th-century Bolognese, it reflects the new ideals which were to spread all over Europe and extinguish Baroque and Rococo alike.

Other factors were G. B. Piranesi's Sta. Maria del Priorato (1765), which revived stricter classical forms in architecture, though combined with imaginatively rich decorative detail based on antique trophies, and the cult of ruins. The traditions of *veduta* painting, established by G. P. Pannini's views of selected antique and modern monuments, painted chiefly for foreign visitors on the Grand Tour, were continued and considerably extended by Piranesi's stupendous series of huge etchings of Roman ruins, views, and antique fragments. The publication of the discoveries at Pompeii and Herculaneum stimulated excitement and interest and particularly influenced the important contingent of northern artists in Rome—Mengs, Thorvaldsen, Vien, David, Clérisseau, Adam, Flaxman; even the principal Italian sculptor, Canova, was a Venetian. His "Pauline Borghese" (1808; Borghese Gallery) shows to what extent his pure sense of form agreed with the Romantic concepts of antiquity pervading Neoclassicism and provides an interesting contrast to Piranesi's entirely Romantic vision. In architecture G. Valadier's town planning schemes—for instance, the Pincian Steps at the Piazza del Popolo—are decked out in classical forms; these imitative trends culminate in the dead historicism of G. Sacconi's Victor Emmanuel Monument (1884), in the agitated and overloaded eclecticism of G. Calderini's Ministry of Justice (1888–1910), and in the dry evocation of antique-cum-Baroque in G. Koch's Piazza dell'Esedra (now Piazza della Repubblica; 1888), saved by the exuberance of M. Rutelli's *art nouveau* Fountain of the Naiads (1901).

5. 20th Century.—The 20th century produced two conflicting movements: the pompous, pseudo-antique of Mussolini's era, such as the Foro Mussolini sports centre (now renamed Italico) by E. del Debbio (1933), or B. Lapadula's Palace of Italian Civilization intended for the World's Fair planned for 1942; and the amazing postwar development of which the finest example is the main railway station, the Stazione Termini. This was begun in 1937 as a typically Fascist piece of theatrical display, but, abandoned unfinished in 1942, was completed by E. Montuori and L. Calini and saved architecturally in 1952 by a brilliant facade which displays a feeling for movement, proportion, inventiveness, and a fine grasp of the structural possibilities of modern methods of building.

Rome has grown enormously since 1945, and it is rapidly swamping the rather inhospitable surrounding countryside. Much of its mushroom growth of huge apartment buildings, in both private and public ownership, is of a monotonous and distressing vulgarity, insensitiveness, and shoddiness. Some of the newer blocks, however, combine the finest modern structural methods, imaginative use of form and detail, and respect for the grandeur of the setting.

The architectural treasures in the Vatican are described at greater length in the article VATICAN. (L. M. MU.)

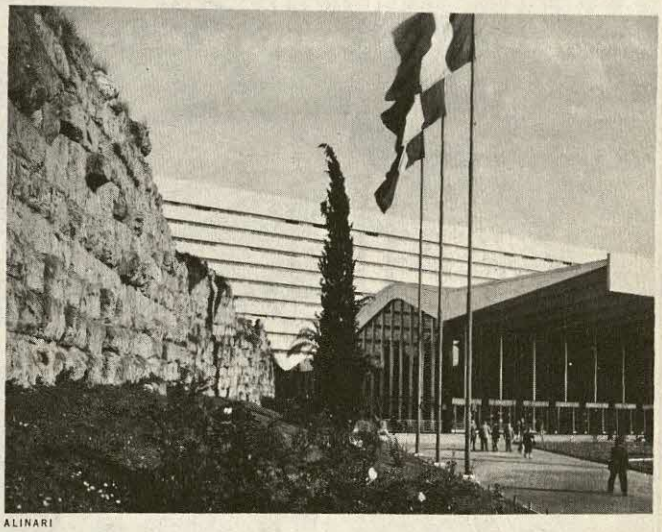
II. ADMINISTRATION, COMMUNICATIONS, INDUSTRIES, AND CULTURE

1. Administration.—An elected council of 80 members chooses a mayor and 14 committee members, with 4 reserves, from among its members. The council is deliberative, the committee executive. The mayor, besides being head of the city administration, is a government officer responsible for such matters as the publication of laws, regulations, and government announcements and the registration of civil status and population statistics. The territory of the Roman communal administration covers an area of 582 sq.mi. (150,738 ha.). It can impose taxes and bylaws on all residents and has the responsibility for providing local amenities such as city police, health and hygiene services, street lighting, road maintenance, and certain aspects of public assistance.



ALINARI

RAILWAY TERMINAL IN THE PIAZZA DEI CINQUECENTO; ARCHITECTURALLY INSPIRED BY THE 4TH-CENTURY-B.C. SERVIAN WALL ABUTTING THE BUILDING

2. Communications.—Public transport is in the hands of two large public utilities, Azienda Tramvie e Autobus del Comune (ATAC) and Società Tramvie e Ferrovie Elettriche di Roma (STEFER), the first providing urban and suburban services, the second long-distance services. The two operate more than 2,500 vehicles including streetcars, trolley buses, buses, and railway cars. There are about 620 mi. (1,000 km.) of roads. In 1955 services started on a state-built metropolitan railway linking Rome's central station with Lido di Roma (Ostia-Lido). In the 1960s additional metropolitan lines to neighbouring towns were being added. Rome also has more than 300 bus routes operated by private companies, which help to serve the residential suburbs. There are six railway stations besides that of Vatican City. The central station is the Roma Termini, from which 12 main and numerous secondary lines go to all parts of the country. About 6 mi. (10 km.) distant from Campidoglio, the heart of Rome, runs the wide ring road which links together nearly all the ancient roads and other main roads.

Rome's special geographical position has been favourable to the development of air traffic, which is centred on Leonardo da Vinci International Airport at Fiumicino, at the mouth of the Tiber, opened in 1960.

3. Industries.—Rome cannot be called an industrial city, though it has a substantial amount of medium and light industry. Building takes first place in the number of employees; other industries include metallurgical works (foundries, ironwork, machinery), electrical apparatus, woodworking, printing, soft furnishings, clothing (including several *haute couture* houses), chemicals, and food processing. But the occupations most typical of Rome are hotel keeping and motion-picture production. There are more than a dozen film production studios and several dubbing studios, including some of the best of their kind in the world; and also many workshops for photographic development and associated processes.

4. Public Gardens and Parks, Museums, and Galleries.—Among Rome's open spaces are the gardens of villas, including those of the Villa Doria Pamphili, the Villa Borghese, the Villa Medici, and the Villa Sciarra. There are also the Janiculum, Quirinal, and Pincio gardens and a number of parks. The many museums include historical, scientific, and military, such as the Museo del Risorgimento, the Museo Geologico, and the Museo dei Bersaglieri. The Museo Capitolino and the Museo Nazionale Romano contain sculpture. The Museo di Roma illustrates the history of Rome with casts, paintings, drawings, prints, etc. The Museo del Palazzo di Venezia exhibits paintings, bronzes, silverware, and tapestries. The Museo Torlonia has excavated Greek and Roman sculptures, and there are Etruscan paintings at the Villa Torlonia. Important for paintings are the Gallerie Borghese, Capitolina (Palazzo dei Conservatori), Colonna, Doria Pamphili, and Pallavicini (in the Palazzo Rospigliosi). There are also the Galleria Nazionale d'Arte Moderna (in the Palazzo delle Belle Arti); the Galleria Nazionale d'Arte Antica, in the Palazzo Barberini; and the Museo di Roma (Palazzo Braschi) with contemporary Italian and foreign paintings.

5. Institutions of Higher Education.—Rome University (now a state university) was founded in 1303 by Pope Boniface VIII. Other institutions include the Istituto Superiore di Sanità (Health Institute, 1935), which has a veterinary department; the Istituto Nazionale di Alta Matematica; the Conservatorio di Musica Santa Cecilia (1570); the Accademia di Belle Arti e Liceo Artistico; and the Istituto Centrale del Restauro, where training is given in the restoration of works of art. Research institutes in scientific and other subjects are numerous; and there are a number of national schools and centres, such as the Accademia Americana (American Academy in Rome, 1894), the Accademia Britannica (British School at Rome, 1901), Accademia di Francia, and Spanish, Slovak, Swedish, and other institutes. *See* also GRAND PRIX DE ROME. (X.)

III. HISTORY

For the history of Rome and of the Roman Empire down to A.D. 476, *see* ROMAN HISTORY. The articles ITALY: *History,* and PAPACY, as well as the biographies of the individual popes, should also be consulted to supplement the account here.

A. FROM 476 TO 1309

1. Odoacer, the Ostrogoths, and the Byzantines.—Once Rome had ceased to be the capital of the Western Empire, its importance waned, its population decreased, and its economic resources shrank. New political forces, the clergy and the lay aristocracy, emerged as the two poles of the city's history for several centuries—the two universal institutions.

Odoacer (*q.v.*), who in 476 deposed the last Western emperor, the usurper Romulus Augustulus, obtained from the Byzantine emperor Zeno the title of patrician. He also wooed the Roman aristocrats and the clergy. In 489, however, Zeno sent another barbarian against him, Theodoric (*q.v.*), king of the Ostrogoths. Theodoric defeated Odoacer (493), established himself in Italy, and lived for several periods in Rome, concerning himself with the local administration, with the restoration of buildings, and with public order. In ecclesiastical affairs he supported Symmachus as pope against Laurentius, candidate of the pro-Byzantine party; but later he threw Pope John I into prison.

Theodoric's program was too ambitious. Soon after his death (526), a long and savage war began between Byzantines and Goths that devastated Italy. Rome was besieged and taken several times, suffering from famine and being, it is said, actually deserted in 547. The popes, as bishops of Rome, intervened between the contending sides and assisted the needy, and in 554 the Byzantine emperor Justinian I issued a "pragmatic sanction" granting the papacy a measure of secular authority in Italy for the protection of the common people. Apparently the Roman Senate had been reduced to a simple municipal council of no political significance; the other civil offices had fallen vacant and were progressively being replaced by ecclesiastical ones.

2. Gregory I and the 7th Century.—At the end of the 6th century the dominant figure was Pope Gregory I the Great, who combined religious faith and practical ability. He reorganized the patrimonial lands of the church (*see* PAPAL STATES), supervised the distribution of alms in and outside Rome, and undertook the defense of ecclesiastical and secular persons and property alike against the attacks of the Lombards (*q.v.*), who had invaded Italy in 568. Several of Gregory's successors played a comparable role to a lesser extent.

3. The Franks.—Rome stood in the frontier zone between Lombards and Byzantines in Italy. Though the Romans generally preferred the Byzantines, the latter not only failed to send adequate military aid but also were theologically at variance with Rome, so that Rome's eventual separation from the Eastern Empire was inevitable. With the object of freeing themselves from the Lombards, who in the 8th century resumed their advance on Rome, the popes looked for help to the Franks. After Pope Zacharias had consented to the assumption of the Frankish crown by the Carolingian Pepin III the Short, Pope Stephen II (III) crossed the Alps to anoint Pepin and to grant him the Roman title of patrician (754). This gesture had the immediate effect of bringing Frankish armies into Italy to save Rome; and the Donation of Pepin, whereby the territory taken from the Lombards was "restored" to the Holy See, was the foundation document of the temporal power of the popes (*see* further PAPACY: *The Medieval Papacy [590–1304]: The Carolingians and the States of the Church;* PAPAL STATES).

The lay aristocracy of Rome would not easily submit to the increased authority of the clergy, and during the third quarter of the 8th century there were violent internal struggles. Pope Stephen III (IV) owed his election in 768 to military action by the *primicerius* or head of the notaries, Christophorus, and the latter's son Sergius. These two were overthrown in 770 by the pro-Lombard chamberlain, Paulus Afiarta, who, however, was put to death before he could deliver Stephen's successor, Adrian I, into the hands of the Lombard king Desiderius. Adrian's understanding with the Frankish king Charlemagne (*q.v.*) restored order in Rome. The Lombard kingdom was destroyed in 774, and Byzantine influence was eliminated from northern Italy. On Christmas Day, 800, Charlemagne was crowned emperor in Rome by Pope Leo III and acclaimed by the Roman people.

A consequence of this revival of a Western Empire was that the appointment of the popes came to be controlled by the emperor's *missus* (legate) rather than by the clergy or by the Roman nobles; but this state of affairs did not last long.

4. The Arabs and the House of Theophylact.—The Frankish sovereigns rapidly lost prestige, and the interests of the Romans could not be ignored. Riots and some double papal elections occurred, but some degree of unanimity was reestablished in the

face of an external danger—the Arab invasions. The Arabs plundered the outskirts of Rome (including St. Peter's) in 846, and their fleet was defeated off Ostia in 849. By constructing a protective wall round St. Peter's, Pope Leo IV formed the suburb known as the Leonine City, nucleus of the later Vatican State. Even so, factional conflict broke out again, and the notable efforts of Pope John VIII against the continuing Arab menace were brought to an end by his assassination in 882.

There followed a sombre period which severer historians have described as "the Iron Age of the Papacy" or "the Pornocracy" ("Whores' Regime") but which nevertheless saw the emergence of a freer civic life in Rome, with a more plentiful array of personalities engaged in it, conscious moreover both of Rome's traditions and of the most pressing economic problems. The course of political events must be briefly illustrated. Two dukes of Spoleto, Guy (d. 894) and his son Lambert, had made themselves kings of Italy (Lombardy) and had obtained the imperial title from Popes Stephen V (VI) and Formosus in 891 and 892 respectively. The dukes put such pressure on Rome that Formosus appealed to the Eastern Frankish king Arnulf, whom Formosus in 896 crowned as emperor. But when Formosus was dead and Arnulf had returned to Germany, the next pope, Stephen VI (VII), again under pressure from the resentful Lambert, had Formosus disinterred and subjected to trial, after which the corpse was thrown into the Tiber.

The first decades of the 10th century were marked by the rise to power of Theophylact, senator of the Romans. Theophylact accumulated civic offices and, together with his wife Theodora and his daughter Marozia (the persons referred to in the term "pornocracy"), came to exercise a true dictatorship, placing nominees of his own on the papal throne and undertaking the defense of Rome against Saracen assaults (his protégé Pope John X distinguished himself in a notable victory on the Garigliano River in 915). Marozia, however, made a false move when she took Hugh of Provence, king of Italy, as her third husband, since this union threatened to deprive Rome of its individual liberty. Alberic, Marozia's son by an earlier union, led a rising in the city, himself assumed the title of "prince of all the Romans," and governed the state from 932 or 933 till his death in 954. Alberic maintained good relations with Byzantium and with neighbouring lords and thought of summoning Cluniac monks to reform the life of the church; but his son, who became pope as John XII in 955 (as Alberic had intended), proved incapable of completing the reconciliation of ecclesiastical and civil authority in Rome. The period of comparative independence ended with the coming of the German king Otto I (*q.v.*), of the Saxon dynasty, who was crowned emperor in 962.

5. The Saxon Emperors and the Crescentii.—Otto I was determined to make his presence felt in Rome, but Leo VIII, whom he installed as pope in the place of the deposed John, was not accepted by the Romans, who chose Benedict V instead. Otto, however, took Benedict prisoner after a siege of Rome in 964, and other revolts were put down. Otto I's successors and the popes whom they protected, however, had to face the resistance of the Roman family of the Crescentii (*q.v.*). One Crescentius, who had rebelled against Pope Gregory V in 996, was besieged in Castel S. Angelo by Otto III in 998 and finally beheaded with great publicity. Otto's own project of a *renovatio imperii* or renewal of the Roman Empire, involving not only a close understanding with the papacy (for which he selected the learned Silvester II) but also the construction of a great palace on the Aventine and the appointment of numerous functionaries with high-sounding imperial titles, met with scant response from the Romans themselves. His premature death (1002) was followed by a resurgence of the Crescentii in the person of John (II) Crescentius, who virtually ruled Rome for a decade.

6. The Tusculans.—The Roman tradition was next carried on by another local family, that of the counts of Tusculum. Related to the house of Theophylact and possessing extensive lands around Frascati and the abbey of Grottaferrata (which they founded), these counts dominated Rome from 1012 to 1045. Three popes (the brothers Benedict VIII and John XIX and their nephew Benedict IX) were members of the family, which moreover held all the principal secular posts, with titles such as "consul and duke of the Romans" and "count of the sacred palace." Occasionally a German king came to Rome to be crowned emperor, but Roman affairs remained in the hands of the citizens, as represented by the Tusculans and other nobles.

7. The 11th-Century Reform.—Breakup of the Tusculan system came as a result of the Hildebrandine or Gregorian reform of the church, so named from its initiator, Hildebrand, the future Pope Gregory (*q.v.*) VII. Under Pope Nicholas II, who as a partisan of Hildebrand was determined to free the papacy from its scandalous subjection to control by laymen, the Lateran Council of 1059 resolved that the election of the pope was to rest with the body of cardinals, incumbents of the oldest and most important Roman churches (*see* CARDINAL); that the Roman people should simply acclaim the pope elected; and that "due honour" (an empty formula) should be paid to the emperor in the matter. The reaction of the Roman nobility, struck to the core in its interests, was long and violent, but finally ineffective, though numerous antipopes were put forward with the support, moreover, of the emperors, whose interests had been no less prejudiced than the nobility's by the reform. The reformers were upheld by new families such as the Frangipane and the Pierleoni, who later became great nobles themselves but who first appeared as representatives of a new class, closely tied to the fortunes of the reformed church and depending more on financial resources than on landed property.

The contest between Nicholas II's successor, Alexander II, and the antipope Honorius II led first to disputations between them at assemblies of the citizens in the Circus Maximus, then to savage street fighting. When both were dead, Hildebrand himself became pope (1073). Violence began again in 1075 when a nobleman, Cencius, assaulted the pope at Mass in Sta. Maria Maggiore and abducted him; but a popular rising set the pope free. Gregory's quarrel with the emperor Henry IV over the universal matter of investiture (*see* INVESTITURE CONTROVERSY) had more damaging consequences: Henry sponsored the antipope Clement III (1080), advanced twice to the walls of Rome (1081 and 1082), then besieged and took the Leonine City (1083), except for Castel S. Angelo, Gregory's last stronghold. Finally, in 1084, Henry entered Rome, where the citizens, bought over by him, let him appoint new officials. Gregory could only appeal to the papacy's vassals in southern Italy, the Normans, who, led by Robert Guiscard, soon came to his help. But the Norman sack of Rome (1084) so infuriated the citizens that Gregory had to flee with his deliverers; he died at Salerno in 1085.

Disputes between Gregorians and anti-Gregorians dragged on until the third decade of the 12th century. Pope Urban II (1088–99), who enjoyed great prestige in western Europe, was weak in his own house. Pope Paschal II's attempt at agreement with the emperor Henry V in 1111 was disowned by the Romans and by his fellow churchmen, with the result that fighting between Germans and Romans and civil disorders continued till Calixtus II came to terms with Henry over investiture in 1122.

8. The Movement for Civic Independence.—Meanwhile new families, the Corsi, the Barunci, the Buccapecora, and the Sant' Eustachio, were emerging in Rome beside the Frangipane and the Pierleoni. Their appearance was symptomatic of a hitherto unprecedented socio-political expansion analogous to that which was giving rise to communes in Tuscany and in northern Italy during this very period (*see* COMMUNE [MEDIEVAL]), but external as well as internal conditions inhibited the growth of a communal movement in Rome. The reformed papacy became dissociated from the civic life of Rome, not only because the distinction between ecclesiastical and civic offices was henceforth sharper but also because there were many foreigners in the Curia, and the clergy was developing a certain prejudice against the Romans, to which a quantity of anti-Roman propaganda gave expression in the 12th century.

The papal schism of 1130–38 originated less from ecclesiastical differences than from a persistent antagonism between the Frangipane and the Pierleoni: the Frangipane supported Pope Innocent II, whom the emperor Lothair II also backed; the Pier-

leoni supported the antipopes Anacletus II (one of their family) and Victor IV, with the backing of the Norman Roger II of Sicily.

There followed a *coup d'état* in 1143, the so-called *renovatio senatus* or "renewal of the Senate," whereby the Romans sought to free themselves from ecclesiastical control and to establish a civic regime of their own. Ever recalling their classical past, they gave the title of senator to their new communal councilors, who were, however, of humble social status and were concerned less with politics than with ordinary administration. This movement, which Pope Eugenius III tried in vain to suppress in 1145, was not at first "anticlerical" in the modern sense, as the Romans remained devoutly Catholic. But a touch of heresy came when Arnold (*q.v.*) of Brescia arrived preaching ecclesiastical poverty and detachment from temporal interests. Arnold also tried to create an "equestrian order" in Rome, so as to organize the industrial and financial bourgeoisie in the guise of the ancient equites and thus to consolidate the citizens' newly won independence; but the whole enterprise collapsed. The German king Frederick I Barbarossa, of the Hohenstaufen dynasty, who gave consistent support to the popes against the Romans till 1159, came to Rome in 1155 to be crowned emperor by Adrian IV (an Englishman), whereupon Arnold was taken prisoner and put to death. The Romans, though they received Frederick with hostility, came to see that they could not detach themselves from the Curia, however alien and oppressive it might be, without incurring interdicts (which checked the influx of pilgrims and damaged their economy) or provoking foreign attacks. Frederick I's breach with Pope Alexander III in 1159 gave some precarious hope of a reconciliation between the emperor and the Romans; but they had rallied to Alexander's cause by 1167, when Frederick routed their troops at Monte Porzio and captured the Leonine City. Then a sudden plague in his camp made Frederick withdraw.

Frederick and Alexander finally made peace in 1177; Pope Clement III, himself a Roman, came to terms with the citizens in 1188, making financial concessions in return for the virtual extinction of communal independence. The senator Benedetto Carushomo, who headed a largely popular revolt in 1191, was deposed and imprisoned. During the pontificate of the great Innocent III various new agreements, concluded between 1198 and 1205, strengthened the church's hold: the prefect of Rome became a papal official; numerous landed properties passed under ecclesiastical control; and the pope assumed the right of nominating the senator.

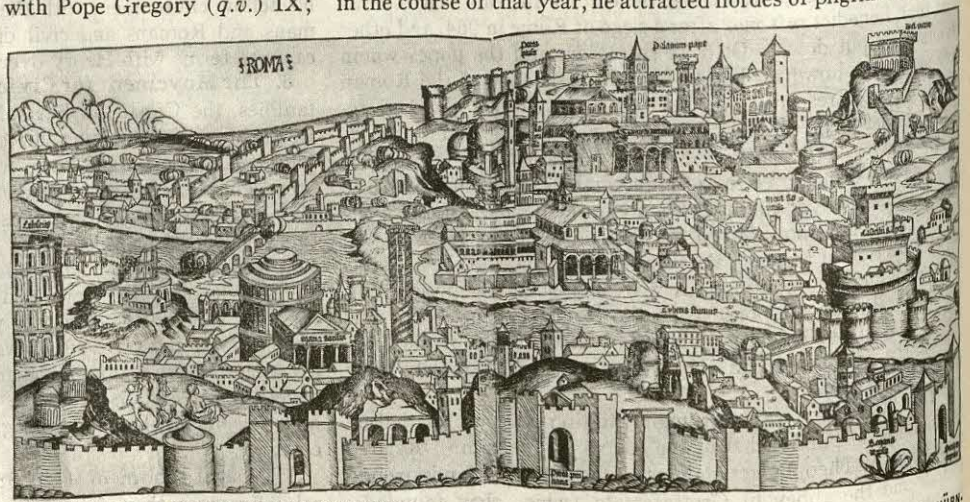
9. The 13th Century.—The strife between the popes and the Hohenstaufen emperor Frederick II (*q.v.*), which went on intermittently between 1227 and 1250, had its repercussions on Rome. The revolt of Luca Savelli (a nephew of a previous pope, Honorius III) in 1234 in defense of the people's rights—or rather of the middle classes' interest in having the roads free for commerce and in being able to dispose of large sums of money—strengthened the emperor's hand in his negotiations with Pope Gregory (*q.v.*) IX; and Frederick sought to incite further revolts by addressing manifestos full of classical references to the Romans. In 1240, however, the Romans were dissuaded by Gregory from admitting Frederick to the city. On Gregory's death (August 1241) the senator Matteo Rosso Orsini held the cardinals in conclave, under conditions amounting to siege, to make them elect a pope of his choice, and, when Celestine IV also died (November), Frederick likewise tried coercion; but Sinibaldo Fieschi, who became pope as Innocent IV in 1243, freed himself from such pressures by escaping from Italy to denounce Frederick at the Council of Lyons.

The various interests, allegiances, and antipathies of the great Roman families are an integral part of the city's history. Members of the Orsini (*q.v.*) and Savelli have been mentioned incidentally above. Other families that came to the fore at this time were the Annibaldi, the Capocci, and, above all, the Colonna (*q.v.*).

Brancaleone degli Andalò, a Bolognese, whose installation as senator in the Capitol was the result of a sudden rising in 1252, initiated a general reform of the Roman guilds (*reformatio artium*) and promoted certain measures against the power of the Curia; but the socially advanced character of his program led to a reaction, and he was overthrown in 1255. By this time, however, the papacy was engaged in its final dispute with the Hohenstaufen dynasty over the kingdom of Sicily, a crucial episode in the duel between Guelphs and Ghibellines (*see* SICILY; NAPLES, KINGDOM OF; GUELPHS AND GHIBELLINES). Attempts to win the Romans' support were made by both sides: by the Hohenstaufen Manfred (*q.v.*), who took advantage of Brancaleone's momentary return to power in 1257–58; and by Charles of Anjou, the French prince who was recognized as senator of Rome by Pope Urban IV in 1263 and who actually assumed the senatorial functions in 1265, just before he was invested with the Sicilian kingdom, as Charles I (*q.v.*), under Pope Clement IV. Having won his kingdom from Manfred (1266), Charles resigned the senatorship, which the papacy had been reluctant to see in the hands of a foreign potentate. After some disturbances, however, the office came, in 1267, to another foreigner, the Castilian infante Henry. This Henry soon declared himself for the Hohenstaufen Conradin (*q.v.*), who arrived from Germany to attack Charles' kingdom and was rapturously received by the Romans. Charles defeated Conradin and took the senatorship again (1268), holding it for ten years, dominating the papacy, and enriching himself by taxation.

Pope Nicholas III, an Orsini, took the senatorship from Charles in 1278 and decided that it should be vested in the pope as a private person (in fact he appointed deputies), believing that this change would resolve the dualism between the ecclesiastical and the secular regimes in Rome. His successor, however, was a Frenchman, Martin IV, who not only packed the Curia with his fellow countrymen but also undid Nicholas III's reform by granting the senatorship to Charles of Anjou again (1281–84). A further cause of lasting detriment to church and city alike was the antagonism between the Colonna and the Orsini. Each of these families, now indisputably the foremost in Rome, had its own train of satellites irreconcilably hostile to the other side.

The energetic and inflexible Boniface VIII, who became pope in 1294, made trouble for himself by trying to aggrandize his own family, the Caetani (*q.v.*) of Anagni, at the expense of the Colonna, against whom he launched excommunication and war. Less unfortunate for Rome was Boniface's proclamation of the first Jubilee, or Holy Year (1300): by offering indulgences to the faithful who visited the Roman basilicas and performed certain acts of charity in the course of that year, he attracted hordes of pilgrims and raised



BY COURTESY OF THE TRUSTEES OF THE BRITISH MUSEUM

VIEW OF ROME AT THE END OF THE 15TH CENTURY. WOODCUT FROM H. SCHEDEL, LIBER CRONICORUM, NÜRNBERG, 1493. IN THE BRITISH MUSEUM

great sums of money, at the same time promoting the restoration of churches and monuments.

The Jubilee of 1300 marks the end of an era in Rome's history. In 1303 the aged Boniface, whom the Colonna and the French king Philip IV's emissary Guillaume de Nogaret surprised and humiliated at Anagni, returned to Rome to die nearly insane. In 1305 a conclave at Perugia elected an Aquitanian archbishop to the papacy as Clement V; and Clement, who did not even set foot in Italy as pope, took up residence at Avignon in 1309. The city of Rome, abandoned to its own economically inadequate resources and to factional strife, slumped into insignificance in the field of international politics. Little remained for the Romans save literary and artistic reminiscences of their ancient greatness.

(PA. B.)

B. From the 14th Century to the Present

1. The Close of the Middle Ages.—The city of Rome which was deserted by the popes in the early 14th century was already somewhat neglected. The 13th-century popes had spent relatively little time there, and the vitality of a community which had no commercial *raison d'être* suffered accordingly. The Roman walls surrounded a number of virtually distinct centres of population—at the Lateran, in the vicinity of St. Peter's, and between these two the civic centre on the Capitol. Gardens, copses, and waste-land separated them and extended over the Seven Hills. The nobility (Caetani, Orsini, Colonna, and others), with fortified residences inside the walls and extensive estates outside, constituted a continuous threat to both the precarious commune and the civil magistracy of the pope.

The French popes, established at Avignon from 1309 to 1377, neither abandoned their material interests in Italy nor maintained them successfully. The city was subjected to violent tensions. At the start of the 14th century the arrangement was reestablished whereby the commune accepted papal suzerainty, the pope nominating a senator. But this system did not operate easily in the absence of a pope. The permanent pressure of the nobility and of the kings of Naples turned every unusual situation into a political crisis: there were upheavals when the emperor Henry VII arrived to be crowned in 1312 and when his successor Louis IV came in 1328. The most dramatic of these episodes was the rise to power as "tribune" of Cola di Rienzo (*q.v.*).

Cola di Rienzo had evoked the glories of ancient Rome, partly perhaps because his imagination had been excited at the crowning of Petrarch (*q.v.*) as poet laureate on the Capitol in 1341. From this point onward there is a steady development of the notion of Rome as a capital city, in which Petrarch's writings played a decisive part. Though it was far from easy for Italians elsewhere to accept with equanimity anything savouring of Roman political ascendancy, the cultural influence of ancient Rome in both its Republican and Imperial phases continued to be felt throughout the peninsula. Elsewhere, in Florence especially, it was Republican memories which stirred men to regard their Roman heritage in a new light; in Rome itself, home of the autocratic popes, it was inevitable that the Rome of the Caesars predominated as an inspiration.

The return of the pope from Avignon in 1377 did not immediately release such sentiments. The year 1378 witnessed the beginning of the Great Schism which was to last until it was ended by the Council of Constance in 1417. This effectively deprived Rome of its significance. Indeed, during the schism any enemy of the papacy could legitimize revolt by alliance with a rival pope or by adherence to conciliar principles. These years were particularly chaotic for the city, and more than once it was at the mercy of the king of Naples. Martin V, a member of the Colonna family, elected undisputed pope at Constance, began the reestablishment of order, but his efforts were imperiled by the impolitic behaviour of Eugenius IV, who estranged the Colonna, so alienated the populace that he was forced to flee the city, and at the same time was at odds with the Council meeting at Basel (*see* PAPACY: *The Renaissance Papacy*).

These years, however, mark a turning point. The papal court spent much time at Florence, where its members became soaked in the new artistic, moral, and literary values summarized in the term Renaissance. And it was at Florence that union was negotiated with the Orthodox Greeks, a move which, though short-lived, gave Eugenius a prestige which few of his predecessors during the last century and a half had enjoyed. Subsequent popes were in fact less powerful as leaders of the church. But they were masters of Rome and imbued with a desire to enhance its standing as a cultural centre.

From the pontificate of Nicholas V (1447–55), and rapidly in and after the pontificate of Sixtus IV (1471–84), Rome began to acquire its Renaissance shape. The 14th century had seen little new construction. Now the old houses and murky corridors were swept away to make room for rational building. Great thoroughfares were constructed and palaces were raised, many of which still survive; and plans were made to rebuild the basilica of St. Peter's, though two centuries were to elapse before the work was completed. Scholars and artists were drawn from other centres, notably Florence, to decorate the new buildings and especially the papal residence at the Vatican. Rome by the end of the 15th century had become the main cultural focus in Italy. (DE. H.)

2. The 16th and 17th Centuries.—The French invasions of Italy after 1494 gave the papacy an opportunity to strengthen its hold over Rome and the papal states. Alexander VI made an alliance with Louis XII of France in 1498, and the pope's son, Cesare Borgia (*q.v.*), ruthlessly imposed his own and his father's authority. The capture and division of the kingdom of Naples by France and Spain in 1501 enabled Alexander to crush the house of Colonna, which had supported Frederick of Naples, and to destroy their castles. The same fate befell the Orsini in 1503, after two members of the house had been murdered by Cesare at Senigallia and Cardinal Orsini had died in prison in Rome. The defeat of Francis I of France by the emperor Charles V at Pavia in 1525, however, led to fear in Rome of the growing imperial power in Italy, and in 1526 Pope Clement VII formed the League of Cognac against the emperor. In 1527 an unpaid and mutinous army of Germans and Spaniards under Charles, duc de Bourbon, marched on Rome and on May 6 forced an entry into the city, Bourbon being killed in the assault. Clement fled to Castel S. Angelo, and for the next eight days Rome was ruthlessly sacked. The imperial troops withdrew in the summer, when plague broke out, but returned in September to sack the city a second time.

The destruction, which brought to an end the cultural influence of Renaissance Rome, was followed by the repressive governments of the Counter-Reformation popes. In 1542 Paul III established the Inquisition in Rome. Although the use of torture and the burning of heretics by Paul IV led in 1559 to a riot in which the palace of the Inquisition was sacked and a statue of the pope thrown into the Tiber, the power and authority of the papacy in Rome increased during this period. Sixtus V, by his reorganization of the papal finances, was able to begin the extensive reconstruction of the city around the Viminal, Esquiline, and Quirinal hills, and on his death in 1590 Rome was one of the wealthiest cities in Europe.

The nepotist popes of the 17th century used this wealth for the aggrandizement of their families. Under Urban VIII the family feuds and street brawls of the days before the Counter-Reformation returned to Rome; corruption and bribery became widespread under Innocent X, and the dignity of the papal authority sank even lower under the Chigi pope, Alexander VII (for the establishment of his ancestors in Rome, *see* CHIGI-ALBANI). In 1662 the Chigi faction, supporters of Spanish influence in Italy, incited the pope's Corsican guards to attack the French ambassador. Threatened with war by Louis XIV, Alexander was forced to make a humble apology for the incident and to erect a monument to commemorate his submission.

3. The 18th Century, the Revolution, and Napoleon I.—By the Treaty of Utrecht in 1713, Austria replaced Spain as the dominant power in Italy. But although in the first half of the 18th century military forces moved across the papal states in the course of the dynastic wars in Italy, Rome itself remained unmolested. The city enjoyed an era of peace under the paternalistic government of the popes until the wars of the French Revolution.

The Roman mob's fatal violence against the diplomat Nicolas de Bassville (*q.v.*) in 1793 infuriated the French government and in 1797 Napoleon Bonaparte advanced on Rome. At the Peace of Tolentino (February 1797) Pius VI was able to save the city only at the price of losing a large part of the papal states.

Rome's independence, however, did not survive for long. In a riot provoked by the Republican minority in the city in December 1797, the French general Léonard Duphot was killed by papal guards; in February 1798 Gen. Louis Berthier occupied Rome. The pope was forced into exile, and the Roman Republic was set up under an executive of seven consuls. Hostility toward the Republic increased as churches were pillaged and Rome was drained of its art treasures. In November 1798 Ferdinand IV of Naples (afterward Ferdinand I of the Two Sicilies) reentered the war against Napoleon. The Neapolitan army led by Gen. Karl von Mack marched into Rome on Nov. 28, but the French returned in December after Gen. J. E. Championnet's victory over Mack at Civita Castellana. The reestablished Republic lasted only until 1799, when the Austrian-Russian campaign swept the French out of Italy.

Napoleon's second conquest of Italy took place in 1800. Pius VII was allowed to retain Rome and the papal territory as laid down in the Treaty of Tolentino; on his refusal to take part in Napoleon's continental blockade in 1807, however, French troops under Gen. Sextius Miollis again occupied Rome on Feb. 2, 1808. In May 1809 Napoleon announced the annexation of Rome and the papal states to the French Empire. Pius replied with a bull of excommunication, which on June 11 was posted on the doors of the three great basilicas of Rome; in July he was arrested and exiled. Rome now became the second city of the Empire, and on the birth of Napoleon's son (later known as Napoleon II) in 1811 Napoleon named him king of Rome. The introduction of the Code Napoléon and subsequent reforms were received with little favour by the Roman population, still strongly influenced by the clergy, and the return (May 1814) of Pius VII, following Napoleon's fall, was greeted with popular acclaim.

4. Rome and Italy, from 1815.—The Congress of Vienna in 1815 formally restored Rome to the pope. The period of repression and reactionary government that followed was brought to an end by the liberal reforms of Pius (*q.v.*) IX. Greater freedom was given to the press, an advisory council of state was set up, and a civil guard was formed. On March 14, 1848, Pius granted a constitution. But on the outbreak of revolutions throughout Europe in that month, Pius became unable to control the extremists in Rome, and when his chief minister, Pellegrino Rossi, was assassinated (November 1848), Pius fled to Gaeta. A constituent assembly, convoked in Rome in December, proclaimed the Roman Republic on Feb. 9, 1849. Meanwhile Giuseppe Garibaldi (*q.v.*) had arrived with his legion, to be joined in March by Giuseppe Mazzini (*q.v.*). The assembly thereupon appointed Mazzini, Aurelio Saffi, and Carlo Armellini as triumvirs with absolute authority. A French army under Gen. Charles Nicolas Oudinot, sent by Napoleon III to restore Pius, was repulsed by Garibaldi from the Janiculan Hill on April 30, but after a heroic defense Garibaldi was forced to abandon the city at the end of June. Pius returned in April 1850, opposed to liberal reform and protected by a French garrison. (*See* also ITALIAN INDEPENDENCE, WARS OF.)

FELICI

THE SIGNING OF THE LATERAN TREATY BY BENITO MUSSOLINI (LEFT FRONT) AND PIETRO CARDINAL GASPARRI (RIGHT), 1929

The decision of Cavour (*q.v.*) to occupy the papal states on behalf of Piedmont in September 1860 deliberately excluded Rome and its surrounding district. The Italian Parliament at Turin declared Rome to be the capital but failed to persuade Pius to renounce his temporal power; and when the kingdom of Italy was proclaimed in March 1861, Rome remained outside. The "Roman Question" lingered on. Garibaldi tried to solve the problem by revolutionary methods and made two unsuccessful marches on the city in 1862 and 1867. The final withdrawal of the French garrison in August 1870 during the Franco-German War, and Napoleon III's defeat at Sedan (Sept. 1), removed the last obstacle to union. On Sept. 20 Italian troops under Gen. Raffaele Cadorna forced a breach in the Porta Pia and seized Rome. A plebiscite in October voted for union with Italy; nevertheless Pius refused to accept the occupation and the government's proposed settlement, the Law of Guarantees (1871), and chose to remain a "prisoner" within the Vatican.

In 1871 Rome became the capital of Italy and the king took up residence in the Quirinale Palace. From that time the population of Rome grew rapidly and there was much speculative building, interrupted by the financial crisis of 1887. New town-planning schemes led to the building of such main roads as the Via Nazionale and Corso Vittorio Emanuele.

It was at a congress in Rome in 1921 that the Fascist movement organized itself as a party, and in the following year the "march on Rome" (Oct. 28) brought Benito Mussolini to power. Rome figured largely in his plans, being the capital of both modern Italy and the Roman Empire; new roads, buildings, and suburbs were constructed, and several archaeological sites were cleared.

The Roman Question was finally solved by the Lateran Treaty and Concordat of 1929 between Pius XI and Mussolini's government. The treaty accepted the existence within Rome of a Vatican City State, under the sovereignty of the pope, and the concordat regulated the relations between the church and the Italian state.

In August 1943, following the bombing of the city by U.S. aircraft, the Italian government declared Rome an open city. Thus, on its liberation by the Allies in June 1944, it had suffered little damage in comparison with other Italian cities.

With the establishment of the Republic in 1948 the Quirinale became the official residence of the president. The Lateran pacts remained the basis of church-state relations, and pilgrims formed a large part of the annual influx of visitors to Rome, particularly during the Holy Year of 1950. Other attractions included the 17th Olympic Games, held in August–September 1960. (X.)

ROME, a city of Georgia, U.S., the seat of Floyd county, is located at the confluence of the Etowah and Oostanaula rivers, 70 mi. N.W. of Atlanta.

Founded in 1834 at the southern gateway of Georgia's valley region, it was an important connecting link between the middle Georgia cotton belt and Tennessee, serving as a clearinghouse for corn, wheat and livestock from the north and cotton from the Coosa river valley which begins just west of the city. The surrounding agricultural area, once devoted primarily to cotton, later became diversified, with livestock and poultry of leading importance. Considerable forest land, two-thirds of which is in pine, provides saw timber and pulpwood. Mining is of some importance, including bauxite, shales and limestones. Textile products have long been a major segment of the city's economy but other manufactured products include paper, furniture, agricultural implements, boats, cotton gins, casket shells, aluminum products and stoves.

The city has a council-manager form of government, in effect since 1919. Near Rome is Berry college, a private liberal arts college founded in 1903, whose students all participate in a work experience program on the campus; in the city is Shorter college, a coeducational liberal arts institution chartered in 1873 and affiliated with the Baptist Church, and Darlington, a private preparatory school for boys. For comparative population figures *see* table in GEORGIA: *Population.* (Js. C. B.)

ROME, a city of Oneida county, east-central New York, U.S., 15 mi. N.W. of Utica (*q.v.*) on the Mohawk river, Wood creek, the State Barge canal and the thruway. With a 1960 population of 51,646 it is the second city of the Utica-Rome standard metropolitan statistical area, comprising Herkimer and Oneida counties (pop. 330,771).

Highlights of its history revolve around colonial and Revolutionary War events. Several forts were built by the British to protect the settlement in 1755, but the most famous was Ft. Stanwix built in 1758 by the general whose name it bore. It was the scene of an important treaty (1768) between Sir William Johnson and Indians of the Six Nations in which lands of western Pennsylvania, Kentucky and West Virginia were surrendered to the crown. The fort was dismantled thereafter and rebuilt in 1776 by order of Gen. Philip Schuyler, for whom it was named (causing the original Ft. Schuyler to be renamed Old Ft. Schuyler, before becoming Utica), but the name Stanwix continued in popular usage. The fame of the fort arose from its role in the battle of Oriskany (*q.v.*), 6 mi. E., on Aug. 6, 1777, when the British advance into the Mohawk valley was stopped. According to local tradition the "Stars and Stripes" (with no stars) was raised in battle there for the first time (*see* FLAG: *Flags of the United States*).

The first earth was turned there for the Erie canal in 1817. Rome later achieved industrial importance as the "copper city" through the manufacture of wire, brass, cable and other products. Metals and machinery industries (vacuum cleaners, radiators, air-conditioning equipment) have since developed. After World War II, Griffiss air force base, with thousands of civilian and military personnel, fundamentally changed the economic and social life of Rome. The township of Rome was organized in 1796, receiving its name "from the heroic defense of the republic made here." The village of Rome was incorporated in 1819, and in 1870 it was chartered as a city. Rome tried city-manager government (1954–58) but returned to the mayor-council system. For comparative population figures *see* table in NEW YORK: *Population.*

(V. C. C.)

ROMILLY, SIR SAMUEL (1757–1818), English law reformer whose chief efforts were devoted to the reform of English criminal law and procedure, was born in London March 1, 1757; he was the second son of Peter Romilly, an English tradesman of Huguenot stock. In the years that followed his call to the bar in 1783, he rose in his profession to become the outstanding chancery advocate in England. He early became identified with the liberal movement of his time. He gave assistance and sympathetic support to the early leaders of the French revolution and became associated with Jeremy Bentham (*q.v.*) and the circle of English law reformers. In 1806 he became solicitor-general in the Ministry of All the Talents and entered the house of commons where he attacked the savage penal laws of the period which indiscriminately authorized the sentence of death in a host of minor felonies. Romilly's program for mitigation of the law was founded on utilitarian assumptions similar to those expressed in the writings of Bentham and Cesare Beccaria (*q.v.*). However, his efforts were obstructed by the conservative reaction in parliament to the French revolution and its aftermath, perhaps best exemplified by the attitudes of Lord Ellenborough in the house of lords, and his immediate successes were not impressive. In 1808 he managed to achieve repeal of an Elizabethan statute that imposed capital punishment on theft from the person. He likewise secured elimination of the punishment of transportation for stealing from bleaching-grounds and the death penalty for soldiers and sailors found begging without a permit. Though frustrated in his larger efforts, Romilly, through his writings and speeches, eventually produced a profound effect and contributed importantly to the reforms that were carried out in the years following his death. Distracted by the death of his wife, he committed suicide on Nov. 2, 1818, in London. His *Memoirs,* with a selection from his correspondence, appeared in three volumes in 1840; a two-volume edition of *The Speeches of Sir Samuel Romilly in the House of Commons* was published in 1820.

See also "Life and Work of Sir Samuel Romilly" by Sir W. J. Collins, in *Trans. of the Huguenot Society* (1908); C. Phillipson, *Three Criminal Law Reformers* (1923). (F. A. A.)

ROMMEL, ERWIN (1891–1944), German army officer, outstanding field commander and desert-warfare tactician in World War II, was born at Heidenheim, near Ulm, on Nov. 15, 1891. He entered the army as a cadet in 1910 and distinguished himself in World War I. After serving mostly as infantry regimental officer and instructor between World Wars I and II, Rommel took command of Hitler's bodyguard battalion in 1939. He commanded the 7th panzer division, which led the rapid advance to the channel in May 1940. In Feb. 1941 he became German commander in Libya and pushed British forces back into Egypt.

Known as the "Desert Fox," he was highly respected by both sides. Despite reinforcements, he was compelled by logistic difficulties and superior British strength to withdraw to Tunisia, whence he was evacuated. As field marshal, Rommel commanded army group B in France, under Gerd von Rundstedt; wounded in an air raid on July 17, 1944, he was sent home to recover.

Rommel had become increasingly disillusioned with Hitler's highhanded conduct of the war and the atrocities ordered by Hitler's headquarters. He therefore did not oppose the conspiracy to remove Hitler, although favouring arrest rather than assassination. He would have been proclaimed chief of state if the assassination attempt against Hitler of July 20, 1944, had succeeded; the investigation of the plot revealed this. On Oct. 14, 1944, Rommel was taken from his home and forced to swallow poison.

Rommel wrote *Infanterie greift an* (1937) and *Krieg ohne Hass* (1950), published in English as *The Rommel Papers* (1953).

See Lutz Koch, *Die Wandlung eines grossen Soldaten* (1950); Desmond Young, *Rommel,* in English (1950). (P. N. T.)

ROMNEY, GEORGE (1734–1802), English history and portrait painter, next in importance after Reynolds and Gainsborough during the latter half of the 18th century, was born at Dalton-in-Furness, Lancashire, on Dec. 15, 1734, the son of a cabinetmaker. After working in his father's studio, in 1755 he became the pupil for two years of an itinerant portrait and genre painter, Christopher Steele, at Kendal, Westmorland. Romney's early work is a harder and provincial variant on the style of Joseph Highmore and much less accomplished than Steele's. Having married and set up as a portrait painter, he toured the northern counties, producing likenesses for a few guineas each. A series of about 20 figure compositions were exhibited in Kendal and afterward sold by lottery.

In 1762, having saved about £100, he left a portion of this sum for his wife and children and went to London, never returning, except for brief visits, until he came in 1798, a broken-down and aged man, to die. He quickly gained notice when in 1763 he won an award from the Society of Arts for a "Death of Wolfe." It was

judged worthy of the second prize but, after a recommendation from Sir Joshua Reynolds in favour of J. H. Mortimer's "Edward the Confessor," Romney had to be content with a donation of £50. This incident led to a subsequent coldness between him and the president and thereafter he held aloof from the Academy. However, Romney was an ambitious yet nervous and introspective character, shunning society and the company of his fellow artists.

He paid his first visit to Paris in 1764, where he was befriended by Joseph Vernet and, significantly, admired the work of Nicolas Le Sueur; Romney had not yet seen Raphael, and Le Sueur's use of the antique would have strongly appealed to him. In all his portraits Romney avoids any suggestion of the positive characteristics or sensibilities of the sitter and, although himself unsociable, ironically his great success with society sitters depended largely upon just this ability for dispassionate flattery.

Line rather than colour dominates; it is the flowing rhythms and easy poses of Roman classical sculpture which underlie the smooth papery patterns of his compositions. Among the works exhibited at the Society of Artists from 1763 to 1772 (this is the only period that he did exhibit publicly) are the "Sir George and Lady Warren and Their Daughter" (1769) and "Mrs. Yates as The Tragic Muse" (1771), in which the figures are abnormally elongated and trapped out in pretentious classical poses. He kept his fees low and soon acquired a large clientele, rivaling in popularity Reynolds, whose near neighbour he had become in Great Newport street. A more intimate portrait group is the "Peter and James Romney" of 1766; and the "Mr. and Mrs. William Lindow" (1772, Tate gallery, London) is one of this period's maturest works.

BY COURTESY OF THE SECRETARY OF STATE FOR COMMONWEALTH RELATIONS

DETAIL FROM A PORTRAIT OF WARREN HASTINGS BY GEORGE ROMNEY, 1795. IN THE INDIA OFFICE LIBRARY

Romney spent more than two years in Italy, leaving for Rome with the miniature painter Ozias Humphrey in 1773. He studied chiefly the Stanze figures by Raphael, although several months were spent studying Titian in Venice and Correggio at Parma. He returned to London in 1775 and settled in Cavendish square. The months abroad had matured his art and a new gracefulness appears in portraits such as "Mrs. Carwardine and Son" (1775, Lord Hillingdon collection); the bland, handsome "Earl Grey" (1784, Eton college); and the conscious elegance of the large full-length "Sir Christopher and Lady Sykes" (1786, Sledmere, Yorkshire). His best years are 1775–85, although the seeds of decline were sown at the time of his meeting with Emma Hart (later Lady Hamilton) about 1781–82 and his acquaintance with the poet William Hayley. Lady Hamilton exercised a morbid fascination over Romney and she became for him a means of escape into an imaginary, ideal world. His "divine Emma" appears in over 50 paintings, in the roles of Cassandra, Circe, Calypso, a Bacchante, a Magdalene or Joan of Arc. John Flaxman, his friend in later years, attests that Romney disliked the drudgery of face painting and longed to do ideal subjects, but little remains of these except a large collection of drawings for ambitious history pieces (mainly in the Fitzwilliam museum, Cambridge) and a few unattractive compositions for John Boydell's Shakespeare gallery of 1787 onward.

Although Romney's fashionable portraits fell off in the last years of his career, his own unhappiness had given him an insight into a mature character, and the "Warren Hastings" (1795, former India office) is a grave and noble work. For Romney it was a swan song. In 1797 he moved to a large studio in Hampstead with the fine collection of casts from the antique which Flaxman had gathered for him in Italy. But he soon retired to Kendal, where he died on Nov. 15, 1802.

ROMNEY, HENRY SIDNEY (SYDNEY), EARL OF (1641–1704), English statesman who played a leading part in the Revolution of 1688, was born in Paris in 1641, the fourth son of Robert, 2nd earl of Leicester. He was at the English court after the Restoration of Charles II and in 1665 was appointed groom of the bedchamber to James, duke of York, and master of horse to his duchess; Charles II made him master of the robes in 1675. He was elected to the Parliament of March 1679 which introduced the first bill to exclude the duke of York (later James II) from the succession, and he became closely associated with the group, led by his nephew Robert Spencer, 2nd earl of Sunderland, and Sir William Temple, which supported the claims of Princess Mary and her husband William of Orange against those of the duke of Monmouth. Sidney was sent in June 1679 as envoy to The Hague where he took the opportunity to further his friends' policy of a close alliance between Holland and England; with Sunderland he tried at various times to persuade William to go to England. Charles II's final triumph over the exclusionists and the disgrace of Sunderland in 1681 led to Sidney's dismissal.

William, now his firm friend, offered him the command of the British regiments in Dutch service, but Charles II only allowed him to accept a colonelcy. He resigned in 1684 and returned to England where he was reappointed master of the robes, a post he held until the Revolution of 1688. Dissatisfied with James II's policy, however, he visited William of Orange in 1686 and then spent six months in Italy; his activities and political aims at this period are not clear. He returned to Holland in March 1687 and in December was sent to England to rally William's supporters among the nobility. His *pourparlers* led to the famous Invitation to William (June 30, 1688), which he signed and may have drafted, and which caused him to be described as "the great wheel on which the Revolution rolled." He returned to Holland in August 1688 and in late October sailed with William's expedition to Torbay. William appointed him colonel of the first regiment of foot guards in 1689 and created him Viscount Sidney of Sheppey.

Sidney remained high in King William's favour but did not prove to have the qualities of an administrator or statesman. He was given the secretaryship of state for the northern department in December 1690, but resigned in March 1692 and was sent as lord lieutenant to Ireland. In the difficult circumstances which followed the Treaty of Limerick (1691) (*see* IRELAND: *History*) Sidney was unable to control the fiercely Protestant Parliament of 1692, and on his recall in 1693 was appointed master general of the ordnance. He was created earl of Romney on May 14, 1694. He succeeded William Bentinck, 1st earl of Portland, as groom of the stole in 1700 and was lord warden of the Cinque Ports from 1691 to 1702. On Queen Anne's accession (1702) he was dismissed from all his offices. He died in London, unmarried, on April 8, 1704. His diary of the times of Charles II was published in 2 volumes (1843). (J. P. K.)

ROMNEY (Kent, England): *see* NEW ROMNEY.

ROMSEY, a market town and municipal borough of Hampshire, Eng., lies 9 mi. (14 km.) NW of Southampton by road. Pop. (1961) 6,350. Situated on the River Test, famed for its salmon fishing, Romsey is dominated by its massive 12th-century Norman abbey church, which replaced a wooden church founded by King Edward the Elder for Benedictine nuns in 907. It still possesses a pre-Conquest crucifix, and a rood of probably 11th-century date built into an outside wall of the south transept. After the abbey was dissolved in 1539 the parishioners of Romsey bought the abbey church for £100, thus saving it from destruction.

King John's house, east of the abbey church, was used as a hunting lodge by King John in 1210 and is now a museum. Romsey obtained its first charter from James I in 1607, the year he visited Broadlands. This house, originally a Tudor building, was practically rebuilt in 1733 when the 1st Viscount Palmerston was in residence. The gardens were laid out under the direction of "Capability" Brown. It became the home of Earl Mountbatten, the town's high steward. Princess Elizabeth (later Queen Elizabeth II) and Prince Philip spent part of their honeymoon there.

Romsey also has a memorial park, a sports centre, and a swimming pool. Embley House, 2 mi. (3 km.) W, now a college, was once the home of Florence Nightingale. The town's chief industries are brewing and market gardening, and in the early 1960s factories for carpets, plastic boats, and light engineering works were erected. (K. C. E. H.; R. J. WA.)

ROMUALD, SAINT (*c.* 950–1027), founder of the Camaldolese Benedictines (Hermits), was born at Ravenna of the ducal family (Onesti). After witnessing his father kill a relative in a duel, he retired to the monastery of St. Apollinaris near Ravenna and later took the habit. Romuald's life throughout was marked by great austerity. In 975 he went to Catalonia, and seems to have been greatly impressed by the vigorous life in the monasteries. In 996 he was appointed abbot of St. Apollinaris, but left after three years and for the next 30 years wandered through Tuscany, the Romagna and southern France reforming old or founding new monasteries. The most important was Camaldoli, near Arezzo, in Tuscany, which he founded about 1012 and which became the mother house of the new order. The order combined cenobitic and eremitical elements, though Romuald's own aim seems to have been only for a more austere following of the Benedictine rule than currently obtained. He attempted to go to Hungary, but was prevented by illness; however, a monastery founded there for him and St. Bruno of Querfurt, by Otto III, was important for missions to the Slavs and Prussians. Romuald stayed for many years in solitude on Mt. Sitria, but in 1026 returned to Val di Castro, where he died, alone in his cell, on June 19, 1027. His chief feast is Feb. 7, since on that date in 1481 his relics were taken to Fabriano. *See* also CAMALDOLESE.

See H. Thurston and D. Attwater (eds.), *Butler's Lives of the Saints*, p. 266 ff. (1957). (Fs. P. C.)

ROMULO, CARLOS PENA (1901–) Philippine general, government official and diplomat, was born Jan. 14, 1901, in Camiling, Tarlac Province, on the island of Luzon. After he received an A.B. degree from the University of the Philippines in 1918 the Philippine government sponsored his graduate study at Columbia University in New York City where he earned an M.A. degree. After his return to the Philippines in 1921 Romulo was appointed assistant professor of English at the University of the Philippines; later he became head of the English department. In 1931 he was made editor-in-chief of the TVT Publications, consisting of three newspapers, one in English, one in Spanish, and one in Tagalog. In 1937 he became publisher of another chain of newspapers.

In 1941 Romulo embarked on a tour of countries near the Philippines and reported his evaluation of the military situation there. His predictions, which proved to be accurate, won for him a Pulitzer Prize for journalism in 1942. When Japan attacked the Philippines in 1941, he became an aide-de-camp to U.S. Gen. Douglas MacArthur on Corregidor Island and his broadcasts became widely known as the "Voice of Freedom." After Japan captured Corregidor, he went with General MacArthur to Australia and then joined the Philippine Commonwealth government of Pres. Manuel Quezon in Washington, D.C., as secretary of information. Romulo went ashore with General MacArthur at Leyte in 1944, and participated with the U.S. forces in the liberation of Manila in 1945. He served as resident commissioner of the Philippines to the United States, 1944–46, and attended the San Francisco Conference of the United Nations in 1945. After 1946 Romulo served as chief of the Philippine delegation to the Far East Commission in Washington, D.C., as chief of the Philippine mission to the United Nations. In 1948 he served as president of the United Nations Conference on Freedom of Information in Geneva, Switz. He was president of the General Assembly of the UN 1949–50 and in 1950 became secretary of foreign affairs of the Philippines. He represented the Philippines in the signing of the mutual defense treaty with the U.S. and the Treaty of Peace with Japan in 1951. In December 1951 he was named ambassador to the U.S. No longer satisfied with the politics of the incumbent Liberal Party, in 1953 he decided to run for the presidency of the Philippines on a third-party ticket, but he withdrew to become campaign manager for the successful Nacionalista Party candidate, Ramón Magsaysay.

Romulo continued as ambassador in Washington but he represented his country at the Bandung Conference of Asian and African nations in 1955. When the Philippines was elected to a seat on the United Nations Security Council in 1956, Romulo served as member of the Council and during the month of January 1957 was its chairman. He was appointed president of the University of the Philippines in 1962, and Pres. Ferdinand Marcos named him secretary of education in 1965.

See C. Romulo, *I Walked with Heroes* (1961). (C. A. B.)

ROMULUS AND REMUS, the legendary founders of Rome. Traditionally they were the sons of Rhea Silvia (Ilia), daughter of Numitor, king of Alba Longa. Numitor had been deposed by his younger brother Amulius and his daughter made a Vestal Virgin to prevent offspring contenders. When Rhea gave birth to twins, claiming Mars as their father, Amulius ordered them thrown into the Tiber. The trough in which they were placed came to ground at the site of the future Rome near the *ficus ruminalis*, a sacred fig tree of historical times. There a she-wolf and a woodpecker (both sacred to Mars) suckled and fed them. Later they were found and brought up by the herdsman Faustulus and his wife Acca Larentia (*q.v.*). They became leaders of a band of adventurous youths and eventually, recognized as the grandsons of Numitor, they killed Amulius and restored their grandfather to the throne. Later they founded the city of Rome. Romulus surrounded the city with a wall, but Remus in contempt jumped over it and Romulus slew him with the words "thus perish any other who leaps over my walls." Thus Romulus ruled supreme and the city was named for him. Romulus added to the population of the new city by offering asylum to fugitives and exiles. Because of a shortage of women, he invited the neighbouring Sabines to a festival and carried off their women. The intermarriage of Roman and Sabine was followed, after some hostility, with a political union under Romulus and Titus Tatius (*q.v.*), king of the Sabines. Titus Tatius' early death left Romulus in complete control. After a long rule he one day mysteriously disappeared in a storm. He was believed to have been changed into a god and was worshiped as Quirinus (*q.v.*) by the Roman people.

This legend, probably originating in the 4th century B.C. and set down in coherent form by the early annalists at the end of the 3rd century B.C., is of course artificial and shows a strong Greek influence. Rationalizations of various aspects of the story have been made in both ancient and modern times. The theme of exposed children is a familiar one in Greek legend and literature. The name Romulus (and perhaps also Remus) is derived from Rome and is consonant with the Greek practice of seeking an eponymous hero who of course is inevitably deified. The story is well adapted to the topography of ancient Rome, but the places mentioned are clearly introduced to account for sacred areas of historical time. The *ficus ruminalis* ("the suckling fig"?) and the nearby Lupercal ("wolf's den"?) may have themselves suggested the suckling by the she-wolf. Livy gives an interesting rationalizing version: that Larentia, because of her loose morals, had got the nickname "she-wolf" among the shepherds. The story of the asylum was clearly invented to explain the name of the depression between the Arx and the Capitol. The rape of the Sabine women explains the custom of simulated capture in the Roman marriage ceremony as well as the historical admixture of Sabine elements in the Roman population.

The importance of Mars in the legend is an obvious attempt of Romans to connect their origins with this principal Italian deity, and it is perhaps no coincidence that Romulus is apotheosized into Quirinus, a god related to Mars. On earth Romulus, a war-

like king, was founder of many of the Roman military and political institutions.

BIBLIOGRAPHY.—J. Carter in Roscher's *Lexikon*, s.v.; E. Pais, *Ancient Legends of Roman History* (1906); Hugh Last in *Cambridge Ancient History*, vol. vii, pp. 363 ff., 370 ff. (R. B. LD.)

ROMULUS AUGUSTULUS, commonly known as the last of the Western Roman emperors (475–476), was in fact a usurper and was not recognized by the Eastern emperor. He was named after his grandfather, a certain count Romulus, and was the son of the patrician Orestes who had had considerable influence with Attila and had lived at the Huns' headquarters. Romulus' original name was Romulus Augustus, the latter being turned into a diminutive because he was still a child when his father elevated him to the throne at Ravenna on Oct. 31, 475, after driving out Julius Nepos (*q.v.*). For about 12 months Orestes ruled Italy in his son's name, but eventually his troops mutinied and found a leader in Odoacer (*q.v.*). Orestes was put to death at Ravenna on Aug. 28, 476. Odoacer, however, spared Romulus on account of his youth, gave him a pension, and sent him to live with his relatives in Campania. His subsequent fate is unknown. (E. A. T.)

RONCESVALLES (Fr. RONCEVAUX), a village of Navarre province, northern Spain, lies at 3,220 ft. (981 m.) in the Pyrenees, within 5 mi. (8 km.) of the French frontier and 26 mi. (42 km.) from Pamplona. Pop. (1960) 99, with less than a dozen inhabited houses. Above the village is the Puerto de Ibañeta, or Pass of Roncesvalles (3,648 ft. [1,112 m.]), the traditional site of the ambush and defeat of Charlemagne's army (778; *see* CHARLEMAGNE). According to legend (*see* ROLAND, CHANSON DE), it was there that Roland, Oliver, and Archbishop Turpin, with the greater part of the French Army, were killed. A similar fate was avoided (810) by Louis I, "the Pious," or *"le Débonnaire,"* then king of Aquitaine, who forced the wives and children of the local inhabitants to go with his army through the pass. At the summit of the pass are the remains of an early chapel of San Salvador (called Charlemagne's chapel) and the Charlemagne monument (1934). In the village is an Augustinian abbey, founded about 1130 by Sancho de la Rose, bishop of Pamplona, and the king of Navarre, for the use of pilgrims, especially those en route to Compostela, many of whom are buried there. The main church was built by Sancho VII, "the Strong," of Navarre (*c.* 1230), and contains the tombs of Sancho and his wife, Clémence. A 13th-century statue of the Virgin of Sorrows (wood, covered with gold) stands in the centre of the altarpiece. Roncesvalles is the scene of a procession of penitent pilgrims, each carrying a heavy cross and wearing a black hood, on the Wednesday before Whitsunday.

RONDEAU, one of several related medieval verse and musical forms that were originally covered by the Old French term *rondel* (*rondellus*). Besides the rondeau, they include the virelai and the ballade (*qq.v.*); all three are characterized by the use of a refrain (a term here used in the sense of a repeated line or lines within a strophe, or throughout a poem of linked strophes). For the rondeau as a musical form *see* TROUVÈRES: *Musical Forms; see* also RONDO.

The rondeau developed in France, where a common 13th-century form follows the rhyme scheme *ABaAabAB* (the capital letters indicate the text of the refrain, shown in the examples by italics). This form was used by Adam de la Halle (*c.* 1250–1306; *q.v.;* the first to call it a *rondel*):

Amours et ma dame aussi,
Jointe mains vous proi merchi.

Votres grant biauté marvi,
Amours et ma dame aussi.

Si n'avès pité de mi;
Votres grant bonté marvi.
Amours et ma dame aussi,
Jointes mains vous proi merchi.

This has been translated as:

"Love and my lady too, with clasped hands I beseech your pity! It was to my misfortune that I beheld your very great beauty, *Love and my lady too.* If you do not take pity on me, then it was to my misfortune that I beheld your very great merit. *Love and my lady too, with clasped hands I beseech your pity!"*

This kind of rondeau is one of three types recognized by Eustache Deschamps (*q.v.*) as verse forms governed by regular rules in his *Art de dictier* (1392), the first French treatise on versification. He calls it the *rondel sangle* ("simple"). Deschamps' second type (no name is given), apparently peculiar to the 14th century, is of 13 lines. His third type, which he calls the *rondel double* (later called the *rondel redoublé*, or *parfait*), is of 16 lines; it reached its height with Guillaume de Machaut (*c.* 1300–77; *q.v.*), as is shown by the following eight-line example:

Blanche com lys, plus que rose vermeille,
Resplendissant com rubis d'Oriant,
En remirant vo biauté non pareille,
Blanche com lys, plus que rose vermeille,
Suy si ravis que mes cuers toudis veille
Afin que serve a loy de fin amant,
Blanche com lys, plus que rose vermeille,
Resplendissant com rubis d'Oriant.

translated as:

White as the lily, redder than rose,
Shining with rubies from the East,
Thy matchless beauty I disclose,
White as the lily, redder than rose,
My charmèd heart do I dispose
That I as lover serve at least
White as the lily, redder than rose,
Shining with rubies from the East.

The poets of the late 14th and 15th centuries introduced variations into the 16-line *rondel double*. Some rondeaux by Christine de Pisan (1364–*c.* 1430; *q.v.*), for example, have up to eight lines in the first strophe; make less use of the refrain; and have lines of unequal length. During this period, rondeaux with strophes of more than four lines became known as *rondeaux doubles*, and those with 16 lines (Desportes' *rondels doubles*) were renamed *rondeaux quatrains*. Charles d'Orléans (1394–1465; *q.v.*) excelled in composing this type of rondeau, and of many well-known examples the following is typical:

"Le Printemps"
Le temps a laissié son manteau
De vent, de froidure et de pluye,
Et s'est vestu de brouderie
De souleil luisant, cler et beau.

Il n'y a beste, ne oyseau,
Qu'en son jargon ne chant ou crye:
Le temps [a laissié son manteau
De vent, de froidure et de pluye.]

Rivière, fontaine et ruisseau
Portent, en livrée jolie,
Goultes d'argent d'orfavrie
Chascun s'habille de nouveau:
Le temps [a laissié son manteau
De vent, de froidure et de pluye,
Et s'est vestu de brouderie,
De souleil luisant, cler et beau.]

translated, without the last two lines of the refrain, as:

"Spring"
Time has lost her wintry gear
Of wind, and cold, and rain,
And is attired again
In radiant sunlight, bright and clear.

All birds and beasts, both far and near
Do sing and shout amain:
Time has lost her wintry gear
Of wind, and cold, and rain.

Rivers, fountains, streams appear
In all their raiment gay,
And sparkle on their way,
And silverly shine forth again:
Time has lost her wintry gear
Of wind, and cold, and rain.

The loss of the last lines of the refrain probably derives from the copyists' habit of giving only the first words of a refrain when it was repeated: this was called the *rentrement*. That this is the

case in the original manuscript of "Le Printemps" is shown above by square brackets. Perhaps as a result of this copyists' convention, poets themselves reduced the refrain, substituting two *rentrements* for six refrain lines, and thus producing a 12-line rondeau from the 16-line *rondeau quatrain.* A similar use of two *rentrements* for the eight lines of the refrain of a 21-line type of rondeau (rhyming *aabba aabAAB aabbaAABBA*) created the 15-line rondeau (rhyming *aabba aabR aabbaR: R = rentrement; i.e.,* refrain). This, the standard type in the 16th century, is exemplified by Clément Marot (*q.v.*). It was revived by the early 17th-century *précieux*—writers opposed to the restrictions imposed by the academies, chief among them being Vincent Voiture (*q.v.; see* also FRENCH LITERATURE: *The 17th Century*).

Again rejected by the classical poets and critics of the late 17th and 18th centuries, the rondeau and similar forms only reappeared with the advent of Romanticism. Rondeaux were first written in the 19th century, in irregular form (*ababa* for *aabba*), *c.* 1830, by Alfred de Musset; then in regular form by Théodore de Banville (*q.v.*), who, as well as writing rondeaux of the standard 15-line type, revived the 16-line *rondeau quatrain;* his most important collection was *Rondels* (1874). These forms were used by the Parnassians and early Symbolists (*qq.v.*), and the poet and musician Maurice Rollinat (1846–1903) wrote more than 100 rondeaux. Few 20th-century poets, however, have used the forms.

The rondeau, introduced in Germany (where it was called *Rundum,* or *Ringelgedicht*) in the late 16th century by Johann Fischart for satirical verse, was used early in the 17th by poets of the Heidelberg school (*see* GERMAN LITERATURE: *The 17th Century*), especially Georg Rudolf Weckherlin (1584–1653). It was reintroduced in the 18th century by Johann Nikolaus Götz (1721–81) who wrote occasional verse trivial in theme but of interest for its use of foreign verse forms.

The rondeau was introduced to England in the 14th century by Chaucer, whose early love lyrics—"ballades, roundels and virelays"—were influenced by Machaut. An example is the "triple roundel," "Merciles Beautè," the first part of which, "Captivity" (the other two being "Rejection" and "Escape"), is as follows:

Your eyen two wol slee me sodenly,
I may the beautè of them not sustene,
So woundeth hit through-out my hertë kene
And but your word wol helen hastily
My hertës wounde, whyl that hit is grene,
Your eyen two wol slee me sodenly,
I may the beautè of them not sustene.

Upon my trouthe I sey yow feithfully,
That ye bene of my lyf and deeth the queene
For with my deeth the trouthë shal be sene.
Your eyen two wol slee me sodenly,
I may the beautè of them not sustene,
So woundeth hit through-out my hertë kene.

Here Chaucer uses the French 14th-century 13-line form, to produce a lyric combining neatness of versification with expression of real, if formalized, feeling.

After Chaucer's time the rondeau lapsed, as Italian influence gained ground. In the late 19th century, however, it became briefly fashionable under *fin de siècle* French influence. Swinburne in his *A Century of Roundels* (1883) invented an 11-line rondeau (rhyming *abaR bab abaR*) by rhyming the shortened refrain at the beginning of the first line with the second line, and omitting the refrain after the second strophe. More regular rondeaux were written by Austin Dobson, Edmund Gosse, W. E. Henley, and Robert Bridges, and translations of French rondeaux were made by Henley, Andrew Lang, and Longfellow. Few rondeaux of this period were of great intrinsic merit, however. Almost the only correct example of a regular form is Austin Dobson's "In After Days," which uses refrain and recurring rhyme scheme with something of its intended effect:

In after days when grasses high
O'ertop the stone where I shall lie,
Though ill or well the world adjust
My slender claim to honour'd dust,
I shall not question nor reply.
I shall not see the morning sky;
I shall not hear the night-wind sigh;
I shall be mute, as all men must
In after days!

But yet, now living, fain would I
That someone then should testify,
Saying—"He held his pen in trust
To Art, not serving shame or lust."
Will none?—Then let my memory die
In after days!

RONDO (RONDEAU), in music, an instrumental form derived from a medieval verse form, the rondeau (*q.v.*), and developed in the 18th century as a solo piece or as a finale of the sonata and symphonic forms. In the 13th-century songs of the trouvères and in the polyphonic music of the 14th and 15th centuries the structure of the rondeau consisted of two sections A and B, which constituted the music for both the refrain and the *additamenta,* usually taking the form A B a A a b A B. In the harpsichord rondeaux of Couperin, Rameau, and others the refrain alternated with episodes according to the scheme A B A C A D, etc. The refrain, and also the episodes, were 8 or 16 bars in length, and each episode gravitated around a different key, such as the dominant or the relative minor. The symphonic rondo of the 18th century was not essentially different from these earlier forms. The number of episodes was reduced and their alternation with the refrain was conceived in such a way that the form had a three-part (ternary) character. A common form was A B A C A B A. A highly developed form of the rondo is the finale of Mozart's Piano Concerto in A major (K. 488). This is a movement in nine sections in which the episodes are boldly worked out and contrasted. Sometimes in the 19th-century rondo the refrain was inclined to be repeated mechanically, as in Beethoven's Sonata in E minor, Op. 90, where it is heard no less than eight times in its original form. Weber, Chopin, Mendelssohn, and Saint-Saëns are among the composers who developed the rondo in the 19th century. In the 20th century several works of Olivier Messiaen, notably the *Turângalîla* Symphony, are built on the principle of the rondo.

RONDÔNIA, a federal territory in the central-west region of Brazil, bounded north by Amazonas, east by Mato Grosso, west by Bolivia and south by Bolivia and Mato Grosso. Pop. (1960) 70,783; area 93,839 sq.mi. (243,043 sq.km.). The territory, established in 1943 as Guaporé, was renamed Rondônia in 1956 after Marshal Candido Mariano Rondon, Brazil's famous explorer. The area was important during the Amazon rubber boom, but declined after the collapse of the industry, in 1912.

The Madeira-Mamoré Railroad, operational between Pôrto Velho and Guajará Mirim, was built there in connection with the rubber industry. Rubber exports still provide the territory with a large part of its income. Brazil nuts are also an important export commodity. Mineral resources include diamonds, mercury, gold, bauxite, gypsum and quartz. The population is composed largely of Indians and mestizos.

Pôrto Velho (pop. [1960] 19,387) is the territorial capital, terminus of the Madeira-Mamoré Railroad and entrepôt for the Bolivian trade. River transportation on the Madeira, Mamoré, Guaporé (*qq.v.*) and their affluents is supplemented by air service from Pôrto Velho, Guajará and Príncipe da Beira. (J. L. TR.)

RONSARD, PIERRE DE (1524–1585), French poet, chief of the Pléiade (*see* FRENCH LITERATURE), was born Sept. 11 (?), 1524, at the Château de la Possonnière (Loir-et-Cher). His father Louis de Ronsard, a member of the Vendômois nobility, held a court appointment. Ronsard spent his youth in his native province, which was often to inspire his poetry. In 1536 his father placed him as page first to the dauphin, later to Prince Charles. He accompanied Princess Madeleine to Scotland after her marriage to James V in 1537. Returning in 1538, he was sent to Flanders, again to Scotland (where his ship was wrecked in the very last stage of the voyage) and to England. Early in 1540 he

resumed his education at the Écurie Royale and from May to August accompanied the diplomat Lazare de Baïf on a mission to Haguenau. In the autumn, a severe illness followed by a long convalescence at La Possonnière left Ronsard partially deaf and forced him to abandon all thought of a military or diplomatic career. In 1543 he received the tonsure, which enabled him to qualify for ecclesiastical benefices without being ordained priest.

Encouraged by Jacques Peletier, Ronsard then turned to poetry, which, he tells us, had always attracted him. His father died in 1544 and Ronsard went to Paris. He studied with Antoine de Baïf, the diplomat's son, under the famous Hellenist Jean Daurat (Dorat). Daurat's brilliant lectures at the Collège de Coqueret inspired Ronsard and Baïf with a passion for Greek poetry and a desire to revolutionize French poetry. They were joined at Coqueret by others, including Belleau and Du Bellay, who in 1549 published the manifesto of the new *brigade* of poets, the *Défense et illustration de la langue française,* preaching judicious imitation of the ancients and Italians and cultivation of their genres. Ronsard's contributions to this manifesto are erudite, full of mythological lore and arrogantly addressed to a learned élite. His *Odes* (1550, 4 books) are inspired by Pindar and Horace; his *Amours* (1552), decasyllabic sonnets of great lyrical intensity celebrating a young court beauty, Cassandre Salviati, imitate the manner of Petrarch. They were set to music by Pierre Certon, Claude Goudimel, Marc-Antoine Muret and Clément Janequin.

The *Odes* brought Ronsard fame and provoked the raillery and enmity of Mellin de Saint-Gelais, then the favourite court poet. He was defended by Princess Marguerite, sister of Henry II, and her chancellor Michel de L'Hôpital. Ronsard expressed his triumph, his gratitude and his lofty conception of poetry in the Pindaric *Ode à Michel de L'Hôpital* (1552). Then he turned to less pretentious models—the Greek Anthology, the Anacreontea, Catullus—and wrote simpler poems. The *Folastries* (1553), *Bocage* (1554), *Mélanges* (1554, title page 1555), the sonnets and odes written for new editions of the *Amours* and *Odes,* all show a lighter mood. Next Ronsard, in love with Marie, a simple country girl, published the *Continuation des amours* (1555) and the *Nouvelle Continuation* (1556), sonnets and songs no longer chastely Petrarchan but playful and epicurean in tone, with a charming background of country sights and sounds. The lofty *Hymnes* in alexandrines (1555–56) show a return to the erudite manner. Modeled on Callimachus, Theocritus and others, they contain fine epic descriptions and religious or philosophical meditations. Many of Ronsard's hymns and odes are of an official or laudatory character. He was in the favour of Henry II, who made him counselor and almoner (1559). His collected *Oeuvres* appeared in 1560.

With the deaths of Henry II in 1559 and Francis II in 1560 France entered the dangerous period of the religious wars. Ronsard, intensely loyal and patriotic, used his pen in the cause of the monarchy, the established religion and national unity. His *Institution pour l'adolescence du Roi Charles IX* (1562) shows him unafraid to preach duty and morality to the young king. His polemical *Discours des misères de ce temps, Remonstrance au peuple de France* (1562) and *Réponse aux injures et calomnies* (1563) show him aware of the political and religious problems and critical of abuses in the church. Patriotic indignation, vigorous satire and invective against the Protestants alternate with passages of imaginative poetry or sincere self-revelation. Ronsard appears here, as always, versatile and original. In 1565 the *Elegies, mascarades et bergerie* show Ronsard producing official poems and verses for court entertainments. He enjoyed the friendship of Charles IX, a passable poet, and exchanged poems with him. He went on experimenting, correcting, adding new poems for his editions of 1567, 1571, 1572–73, 1578 and 1584. Ronsard's most ambitious work, his epic *La Franciade* (1572), tracing in decasyllabic couplets the founding of the French nation by the Trojan hero Francus, had little success and only four books appeared.

Ronsard had been undisputed "prince of poets and poet of princes" for many years but a new poet, Desportes, became the favourite of Henry III. Ronsard, stung into competition, published many new poems in the 1578 edition: *Diverses amours,* the exquisite sonnets and elegies *Sur la mort de Marie* and the *Sonnets pour Hélène* (H. de Surgères), a learned and virtuous lady-in-waiting of 20. Some are erudite or precious in the Italianate style that was again fashionable; others, harmonious, intimate and sincere, show a new maturity.

The poet's last years were tormented by arthritis and recurrent fevers; he usually avoided the court and lived at his priories of Croixval (Vendômois) and Saint-Cosme (near Tours). He gave his time to his religious duties, gardening and the tireless revision of his poems. In Paris he often stayed with Jean Galland at the Collège de Boncourt. Ronsard remained a poet to the last. The moving sonnets which he dictated to a monk a few hours before his death (*Derniers vers,* 1586) show his splendid gifts still unimpaired. He died at Saint-Cosme, Dec. 27–28, 1585.

Claude Binet in his *Life of Ronsard* (1586) gives an attractive picture of the poet—tall, athletic, distinguished, soldierly; in conversation charming, frank and sincere. "His life and his writings bore an indefinable stamp of nobility and in all his actions shone forth the characteristics of a true French gentleman." Ronsard was the greatest poet of the French Renaissance. He had a European reputation; Elizabeth I and Mary Stuart sent him gifts; he was imitated in England. He deeply influenced his contemporaries, Du Bartas, A. d'Aubigné, R. Garnier.

Ronsard held a noble conception, deriving from Pindar and Plato, of the poet's mission as the recipient of divine inspiration and the interpreter of higher truths to mankind; he believed that the poet should be morally worthy of this divine gift of genius. He also believed that the poet should work unceasingly to attain perfection. Innumerable variants (no poet has left more) testify eloquently to his labours. He had made a meticulous study of the poetic technique of the Ancients and of the problems of French verse, which he enriched with new lyrical forms. He developed the alexandrine, making it capable of the finest effects. Though deaf, Ronsard greatly loved music and harmony was for him an essential quality of poetry; his sense of rhythm is extremely subtle. His theories appear in *Abrégé de l'art poétique* (1565) and in the prefaces to the *Franciade* (1572; 2nd pref. 1586; title page 1587). Ronsard's work is immensely varied in subject, form and style. Only Victor Hugo can be compared with him for fertility of invention. He writes freely of his own emotions; his best lyrics have the quality of universality. His chief fault, in modern eyes, is an over-lavish adornment of his poems with the Greek mythology he loved. He has fine descriptive powers and, like the Elizabethans, uses magnificent imagery to express his feeling for the majesty of the universe, the power of the cosmic forces, the beauty of Nature and her impact on man's emotions. He meditated on man: his diversity, his greatness, his ambitions, his passions, his destiny of inevitable defeat by decay and death. Death is a subject on which Ronsard always writes well, whether in an epicurean mood or in a Christian spirit.

In the 17th century the development of a new poetic ideal demanding clarity, refinement and restraint put Ronsard's richly imaged poetry out of fashion. Malherbe and Boileau condemned his poetry and he was forgotten until the 19th century, when the appreciation of Sainte-Beuve and others reinstated him. In the 20th century a vast amount of research once more revealed his greatness and his reputation continues to grow. The general public, however, appreciates him most as a simple lyric poet, the poet of nature, love and fleeting time.

RÖNTGEN (ROENTGEN), **WILHELM CONRAD** (1845–1923), German physicist, received the first Nobel Prize for physics

in 1901 for his discovery of X rays. Born at Lennep on March 27, 1845, he received his early education in the Netherlands, and then went to study at Zürich. He then became assistant to August Kundt at Würzburg and afterward at Strasbourg, becoming *Privatdozent* at Strasbourg in 1874. He was next professor of mathematics and physics at Hohenheim (1875), extraordinary professor at Strasbourg (1876), ordinary professor of physics and director of the Physical Institute at Giessen (1879), and professor at Würzburg (1885) and Munich (1900). At Würzburg in 1895 he made the discovery for which his name is chiefly known, Röntgen rays or X rays. Experimenting with a highly exhausted vacuum tube on the conduction of electricity through gases, he observed the fluorescence of a barium platinocyanide screen that happened to be near. Further investigation showed that this radiation passed through various substances that are opaque to ordinary light, and also affected photographic plates. Its behaviour being curious, particularly in reflection and refraction, he doubted that it was to be looked upon as ordinary transversely vibrating light, and guessed that it was due to longitudinal vibrations in the "ether." In view of its uncertain nature, he called it X radiation. For this discovery he received the Rumford Medal of the Royal Society in 1896, jointly with Philipp Lenard, who had already shown (as had Heinrich Hertz) that a portion of the cathode rays could pass through a thin film of a metal such as aluminum. Röntgen also conducted research in other areas, including elasticity, capillarity, ratio of specific heats of gases, conduction of heat in crystals, absorption of heat by different gases, piezoelectricity, and electromagnetic rotation of polarized light. He died at Munich on Feb. 10, 1923. *See* also X RAYS.

See O. Glasser, *Dr. W. C. Röntgen* (1945); R. S. Bowen, *They Found the Unknown* (1963).

ROODEPOORT, a town of the Transvaal, S.Af., lies on the western Witwatersrand about 12 mi. (19 km.) W of Johannesburg at 5,725 ft. (1,745 m.) above sea level. Pop. (1960) 95,211, comprising 40,908 Europeans, 51,398 Bantu, 1,718 Coloureds, and 1,187 Asians. The history of the town is closely linked with the development of the Witwatersrand gold fields. Roodepoort was established as a gold mining camp in 1886 and the progress of the gold mining industry stimulated its growth, and led to the formation of other townships nearby. In 1902 a health board was set up covering Roodepoort, Maraisburg, Florida, Delarey, Hamberg, and Greymont, and in 1904 the area was proclaimed a municipality. Roodepoort, which is largely a residential area, contains separate townships (about 50 in all) for Europeans, Bantu, Coloureds, and Asians. The town has 21 primary, 7 secondary schools, and 1 technical school, and there are more than 80 public parks and a large variety of sporting facilities. The artificial lake at Florida (a popular resort) provides opportunities for yachting, boating, swimming, and fishing. The nearest main centre of communications is Johannesburg, with which the town is linked by road and rail. The economy of the town was formerly dependent upon the gold fields lying along its southern perimeter, but its manufacturing industries, which include iron and steel, wool textiles, and cement and wood processing, are now more important.

The surrender of L. S. Jameson took place in 1896 just outside the town's present boundaries, and a memorial at Doornkop marks the spot where several of the Jameson raiders fell in their last engagement. (H. ZE.)

ROOF, a cover or shelter of the uppermost part of a building that serves mainly as protection against inclement weather. While this article deals primarily with roof construction, related aspects, such as roof design, can be found in ARCHITECTURE; ARCHITECTURAL ENGINEERING; HOUSE DESIGN; INDUSTRIAL ARCHITECTURE; and RESIDENTIAL ARCHITECTURE.

FORMS OF ROOFS

The principal factors determining the form of the roof are structural or aesthetic. Roofs may have flat, pitched, vaulted, domical or warped surfaces. They may be supported on walls, columns, piers or they may extend directly to their foundations.

WOODEN ROOFS

The flat roof is the simplest, least distinguished of roof forms. It is a cover adaptable to rectilinear plan arrangements over large areas. When it is applied to dwellings a light frame construction is appropriate. This type of construction consists of beams, called joists, laid horizontally and supporting a structural cover of boarding on which a membrane type of roofing is applied. The joists have nominal widths of 2 in. and nominal depths ranging from 6 in. to 12 in. in multiples of 2 in. (Nominal dimensions refer to the sawn timber before being finished or sized.)

The joists span from wall to wall and are spaced 16 in. to 18 in. on centres. When the joists are used on long spans, 16 ft. to 18 ft., they require lateral support at intervals of 6 ft. to 8 ft. This lateral support in the form of X bracing is called bridging. Flat roofs of timber construction are found appropriate for industrial plants, but due to the risk of fire they are constructed by using heavy timber beams, spaced 6 ft. to 8 ft. on centres, supporting a plank roof cover. This type of roof is classified as a mill or slow burning construction. Although this type of framing introduces limitations in planning arrangements due to interior column supports (at intervals of 16 ft. to 18 ft.), it is found to be economical and suitable for some industrial operations. Variations of the flat roof construction, in which the plane of the roof has a decided slope, are called lean-to and shed roofs. The supporting sloping beams are called rafters and have the same proportions and dimensions as the joists in the light frame construction. These roofs have the advantage of permitting the use of unit types of roof covering when the slope is sufficiently steep.

The widespread use of the double-sloped or gable (*q.v.*) roof is attributable to tradition, as well as a certain amount of standardization. The principal elements of this type of roof are pairs of

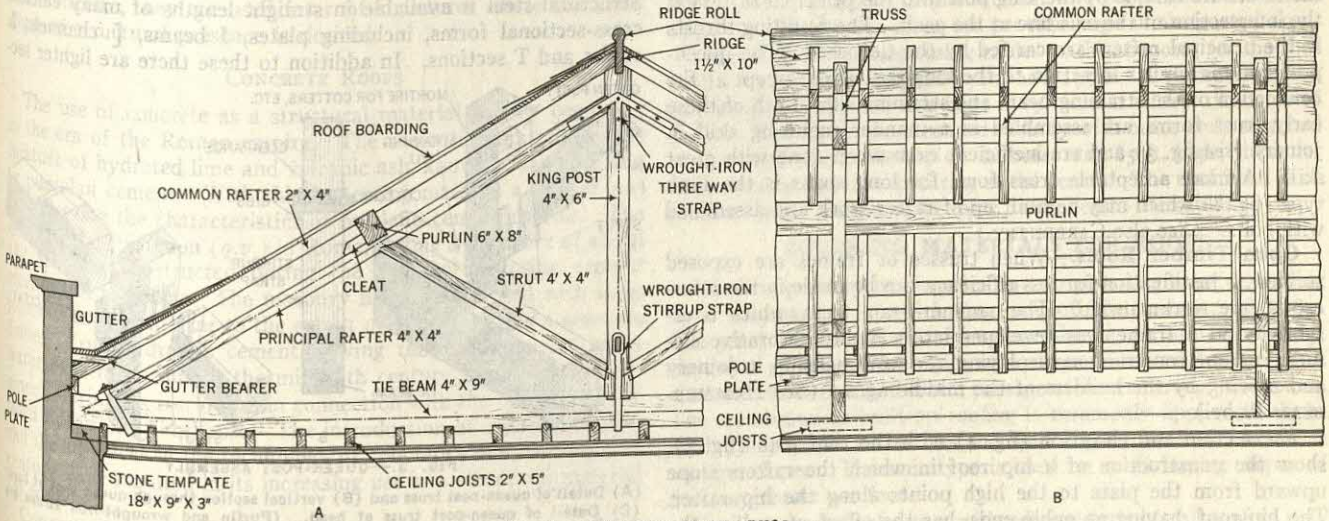

FIG. 1.—KING-POST ROOF TRUSS

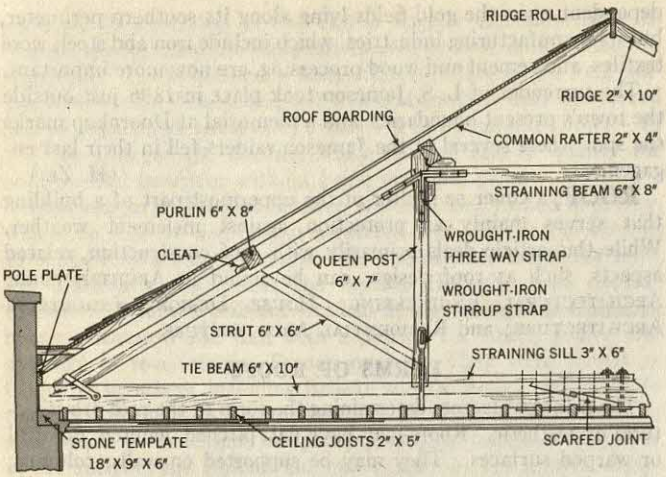

FIG. 2.—QUEEN-POST ROOF TRUSS

rafters meeting at their highest points at a horizontal ridge beam (fig. 1 [A]) that acts as a tie and stiffener. The elements are resolved into a stable framework when the sloping surfaces are boarded in. The lower ends of the rafters rest on a plate which is securely attached to the supporting walls. The weight of the structure and its covering, in addition to the snow and wind forces, bring a considerable thrust to the walls. The magnitude of these thrusts varies with the slope of the rafters, becoming larger as the slopes are reduced. To avoid the thrusts on the walls, a horizontal tie may be introduced for each pair or each alternate pair of rafters. If the ceiling joists rest on the plate or are reasonably close to the elevation of the plate, they may be secured to the walls or rafters and act as ties. If it is impracticable for reasons of headroom (clear height) to place the ties at or near the elevation of the plate, it is possible to reduce the thrust by tying the rafters at an intermediate elevation above the plate with horizontal beams attached to pairs of rafters. These ties, known as collar beams, with pairs of rafters form A frames. This type of roof structure may be used for relatively large spans, ranging up to 26 ft., without the need of intermediate supports for the rafters. When tie beams also serve as ceiling joists they may require intermediate supports on the longer spans. Support may be provided by means of a tie or hanger attached at mid-span of the rafter, or at the ridge, and secured to the ceiling joist.

When the roof span is very large (30 ft. or more), intermediate supports are required in order to avoid the necessity of excessively heavy rafters. These supports are provided by purlins which in turn are carried by roof trusses (*see* TRUSS). (*See* fig. 1 and 2.) The trusses are spaced at intervals of 10 ft. to 12 ft. and provide support for the purlins at the intersection of the axis lines of the struts and principal rafters. The vertical components of force in the struts are carried by the king post into the principal rafters at the intersection of the axis line at the peak. The resulting thrusts in the principal rafters are carried by the tie beam. The queen-post truss is similar in action to the king-post truss except at the connection of the straining beam and straining sill. Both of these early truss forms are assembled in a manner requiring skill in joinery (*see* fig. 3) and are inefficient even when done with great skill. A more acceptable truss form for long spans is the Fink type (fig. 7) which may be built up of rafter stock and assembled with bolts. (*See* also CARPENTRY.)

Open Timber Roofs.—When trusses or frames are exposed to view, a justification for less efficiency can be made in the interest of fine workmanship. The hammer-beam truss, which is essentially an A frame, was developed into a highly decorative element of roof construction displaying fine workmanship in joinery and carving by the builders of the middle ages. (*See* HAMMER-BEAM ROOF.)

The section and elevation (fig. 4) with the roof plan (fig. 5), show the construction of a hip roof in which the rafters slope upward from the plate to the high points along the hip rafter. The hip roof, having no gable ends, has the effect of making the building appear lower, and transmits the thrusts through the hip rafters to corners where the plates, acting as ties, can more readily resist outward forces.

The Mansard Roof.—The mansard roof (*q.v.*) (fig. 6), though rarely used in present-day construction, was once a common form in Europe and the U.S. Its form was primarily a device for providing additional usable area without the necessity of adding a full story. With the cornice line at the base of the upper floor, it gave the appearance of a lower building. Remnants of its influence in the U.S. survived in the practice of using shingles for the upper story of dwellings and clapboards for the lower story. The device of lowering the cornice line to the lower chord of deep trusses and introducing a strip of sloping roof at the exterior walls may well be due to the influence of the mansard roof. (*See* also GAMBREL ROOF.)

Long-Span Timber Roofs.—In the early years of the 20th century the use of timber trusses and frames was generally limited to spans of 50 ft. to 60 ft. This limitation was largely due to the difficulties in joining the various parts with any real assurance of developing the predicted strengths, together with uncertainties about the behaviour and strength of the timbers. The uncertainties of joining since have been reduced with the use of split ring connectors, which in effect have the advantages of larger diameter bolts without reducing the cross-sectional areas of the timbers appreciably.

By mid-20th century the elements of the trusses could be made up of narrow stock which permitted a more accurate selection. The elements are then assembled with ring connectors.

Long-span trusses of the bowstring type, using a laminated curve member, may be employed for spans up to 200 ft., while the Pratt, Howe, Warren and Fink trusses (fig. 7) are acceptable for spans of 100 ft. Frames can be assembled from laminations 1⅛ in. or less in thickness, which permits an accurate selection and arrangement of the laminates for high strengths. The improvements in glues have made the use of laminated arches and frames reliable for long-span structures. Arches and frames have been constructed for spans up to 100 ft.

Laminated frames have become increasingly acceptable for spans of 40 to 60 ft. in buildings where it would be normally undesirable to expose the structure of the roof. Since the laminated frame is a continuous formed member, proportioned in its various parts to resist the forces to which it is subjected, without any visual indication of the joining, its appearance does not conflict with other interior finished surfaces.

STEEL ROOFS

Steel as a material for roof structures has many desirable characteristics. It is strong and stiff, it can be prefabricated in a shop and erected rapidly on the site. The manufacture of steel is controlled so as to produce a uniform quality. Steel permits joining by means of rivets or welding without appreciable loss in strength. Structural steel is available in straight lengths of many efficient cross-sectional forms, including plates, I beams, [channels, L angles and T sections. In addition to these there are lighter sec-

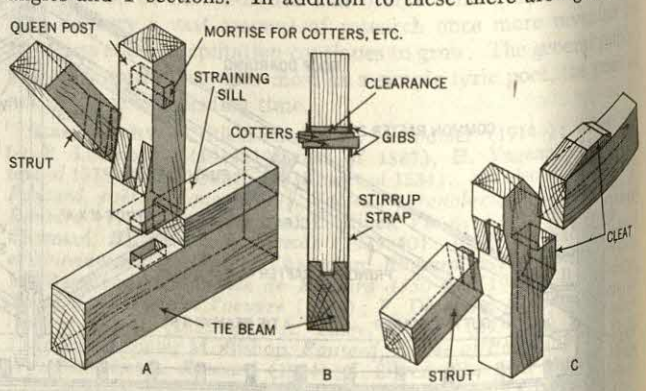

FIG. 3.—QUEEN-POST ASSEMBLY

(A) Detail of queen-post truss and (B) vertical section through queen post at base. (C) Detail of queen-post truss at head. (Purlin and wrought-iron straps are omitted for clearness)

tions formed or assembled into joists and trusses.

For flat roofs requiring noncombustible materials the open-truss steel joist supporting a steel deck and protected by a plastered ceiling is appropriate. The steel joists are available in depths varying by multiples of 2 in. from 8 in. to 20 in. and may be spaced up to 3 ft. on centres on spans ranging from 16 ft. to 36 ft. Other types of structural roof covers or decks may include wood plank or various types of composite materials consisting of a cementing agent, usually portland cement, and a light aggregate having such desirable properties as insulation, resistance to fire, holding power for nails or fasteners and strength. The decking materials are usually precast into sizes consistent with their structural capacities and attached to their supports with clips or fasteners.

Industrial buildings requiring large areas of unobstructed space are usually built with steel roof trusses supporting purlins that carry the structural roof cover. For flat roofs the chord members (top and bottom) are parallel (see fig. 7) except for long spans where the top chord is sloped slightly from the mid-span to the ends in order to facilitate draining of the roof surface. The bottom chord may also be slightly higher at mid-span (cambered) so that the deflected truss does not have the appearance of sagging. The parallel chord trusses are usually designed with depths equal to $\frac{1}{10}$ to $\frac{1}{12}$ of their span and with lateral bracing for the top and bottom chords. For aesthetic as well as economic reasons a sloping margin of roof may be introduced at the outer walls, thus reducing the height of the wall and the apparent height of the building.

For some buildings with moderate spans pitched roofs may be desirable. In principle the structure of the roof using steel trusses is the same as that for timber construction. Thus with the introduction of purlins the span of the rafters or structural roof covering is reduced. For roofs of this type it is often desirable to use a noncombustible structural cover in the form of nailable precast slabs, spanning from purlin to purlin, to which the unit type of covering may be applied. The Fink truss is well adapted to the pitched roof for relatively short spans; it may be used economically for spans of about 40 ft. up to 100 ft. For long spans, a considerable volume of the building is taken by the trusses and their bracing members. Although this volume may be used for ducts, pipelines and other services in industrial plants, it has a more limited use for auditoriums, field houses or gymnasiums, where long-span trusses are required. For these buildings steel arches or rigid frames, which require less depth, are more desirable. Frames and arches may be fabricated from the available standard elements, in the form of plate angles and T sections. Both the frame and the arch introduce thrusts at the foundation which may be taken by tie rods concealed in the floor structure or by buttresses. The purlins and structural cover are similar in arrangement to the flat or pitched roof.

Arches and frames are equally well adapted to short spans. Because of their greater strength and their ability to be incorporated with concrete, they are used for roof structures where the minimum of structural presence is desired.

Concrete Roofs

The use of concrete as a structural material had its beginning in the era of the Roman empire. The cementing material was a mixture of hydrated lime and volcanic ash, known today as a slag or puzzolan cement. With this cementing material a mortar was made having the characteristics of portland cement mortar. The dome of the Pantheon (*q.v.*) in Rome, having a diameter of about 142 ft., was constructed during the 1st century using cement mortar and masonry. The masonry material was laid with large joints of cement mortar to the extent of approximating a concrete dome. True hydraulic cement, having the ability to set under water, was made during the mid-18th century by an English engineer, during his researches in connection with the building of the third Eddystone lighthouse. The introduction of reinforcing steel and the advances in the technology of concrete since the mid-19th century have resulted in its increasing use as a structural material for roofs.

Concrete, being plastic, may be formed into various shapes having flat or curved surfaces. It has an inherent characteristic of continuity when reinforced with steel which eliminates most of the problems of joining and permits the construction of monolithic structures. At first reinforced concrete was used in forms that were modeled after masonry structures, but during the latter part of the 19th century the more familiar forms developed in wood and steel were followed. For roof structures, concrete is rarely used without reinforcing steel. An interesting example of concrete vaulting and domical roofing without metal reinforcement is the Roman Catholic cathedral at Westminster, London, a remarkable building designed by J. F. Bentley and constructed between 1895 and 1903.

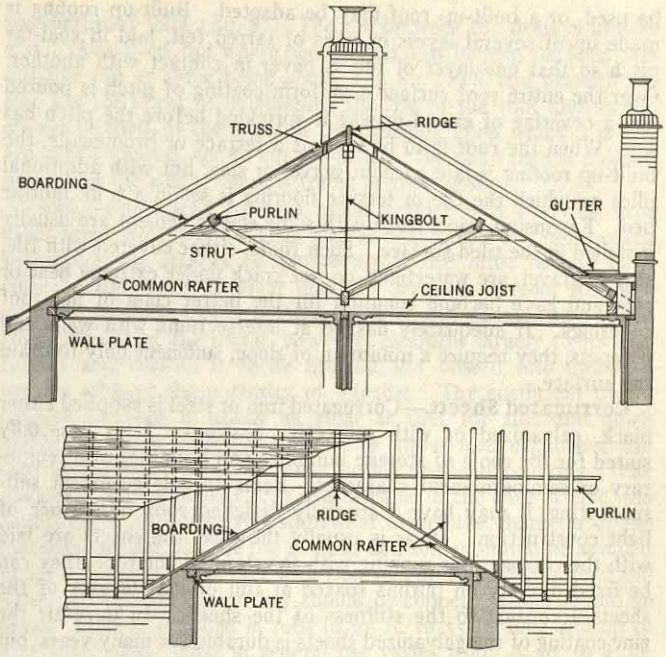

FIG. 4.—SECTION AND ELEVATION OF A ROOF FOR A DOMESTIC BUILDING

Present-day practice tends toward the use of lighter roof structure using thin-shell forms reinforced with steel rods where tension may occur and relying on the capacities of the concrete to resist compression. Structures of thin-shell construction appeared in the 1930s in the form of semispherical domes having diameters up to 80 ft. with shell thicknesses of 3 in. The domes were supported on columns on their periphery.

In more recent years other forms have been built, including cylindrical or barrel shells, spanning in the direction of their long axis. They have cross sections in the form of segments of thin-walled cylinders with stiffening edge beams. Thus they are similar in appearance to vaults with edge beams at the springing line. When placed adjacent to one another and supported on columns along the edge beams, they can provide large unobstructed areas.

Unique roof structures using cables as the supports for the roof were constructed during the 1940s and 1950s. A stadium built in Montevideo, Urug., of this type is cylindrical with a diameter of 310 ft. The cables are arranged radially with outer ends attached to a circular ring at the top of the outer wall 85 ft. high; the inner ends are attached to a steel ring at the centre. The roof itself is of precast concrete slabs (2 in. thick) attached to the cables.

COVERING MATERIALS FOR ROOFS

Roof covers may be classified in two general groups depending upon the manner in which they seal off the entrance of water. One group consists of waterproof membrane, or built-up roofing; the other group of a unit type of waterproof material arranged in a manner so as to avoid direct passage of water through the joints. The membrane or built-up roofing is commonly applied to decks having slopes 2 in. or less per foot and single curved surfaces with varying slopes. The unit type is used on roofs having slopes of 6 in. or greater per foot.

For intermediate slopes, a wide selvage type of roll roofing may

be used, or a built-up roof may be adapted. Built-up roofing is made up of several layers or plies of tarred felt, laid in coal-tar pitch so that one layer of felt is never in contact with another. Over the entire roof surface a uniform coating of pitch is poured and a covering of gravel or slag is sprinkled before the pitch has set. When the roof is to be used as a terrace or promenade, the built-up roofing is laid without gravel or slag, but with additional plies on which the tile or terrace flooring is set in a 1 in. mortar bed. Expansion joints filled with some elastic cement are usually installed in the tiled surface. Such roofs, either covered with tile, slag or gravel, are watertight, do not crack under extreme heat or cold and have become common for the better class of flat roof coverings. If adequately flashed at intersections with walls and parapets, they require a minimum of slope, sufficient only to drain the surface.

Corrugated Sheets.—Corrugated iron or steel is supplied either black, galvanized or with protective coatings. It is especially suited for the roofs of storage buildings and buildings of a temporary or semipermanent character. Being to a large extent self-supporting, it may have a specially designed roof framework of light construction. If, as is usually the case, the sheets are laid with the corrugations running with the slope of the roof, they can be fixed directly on purlins spaced at full or half lengths of the sheets according to the stiffness of the sheets. In pure air the zinc coating of the galvanized sheets is durable for many years, but in large cities and manufacturing towns its life is short unless protected by painting. In such districts it has been found that sheets manufactured with protective coatings applied on iron or steel are more serviceable. In such districts it has been found that plain sheets, well coated with paint, will last longer than those galvanized, for the latter are attacked by corrosive influences through minute flaws in the zinc coating developed in the process of corrugation, in transit or from a defect in the coating.

For roofing purposes the sheets are supplied in several thicknesses ranging from no. 16 to no. 22 standard wire gauge. No. 16 is for exceptionally strong work. No. 18 and no. 20 are used for standard work and no. 22 for temporary buildings. The sheets when laid should lap one full corrugation at their sides and from 3 in. to 6 in. at the ends. Riveting is the best method of connecting the sheets, although galvanized bolts, which are not as satisfactory, are frequently employed. The joints should be along the crowns of the corrugations to avoid leakage. Holes can be punched during the erection of the roof. For attachment to timber framework, galvanized screws or nails with domed washers are used. Fixing to a steel framework is effected by galvanized hook bolts which clip the purlins and pass through the sheet. Sheets formed with V crimps, spaced about 15 in. on centres with the portion between being flat, give a better effect in some positions than the $1\frac{1}{4}$ in. to $2\frac{1}{2}$ in. corrugated sheets.

Aluminum.—In addition to the surface-protected iron and steel corrugated sheets, there are available in many areas aluminum sheets and rolls. As a light material having insulation value this corrugated material is well adapted to general use. It should be applied to a structural roof cover in a manner similar to that used for laying corrugated iron and steel sheets, using aluminum nails with screw shanks.

Composition.—A widely accepted corrugated sheet manufactured under various trade names consists of a formed sheet using portland cement and asbestos fibre compressed under great pressure into a monolithic unlaminated sheet having good strength characteristic and durability. It resists corrosion and has a high resistance to acid fumes and to exposure to extreme weather conditions. It may be used as the structural cover for flat roofs and the complete cover for pitched roofs having slopes greater than

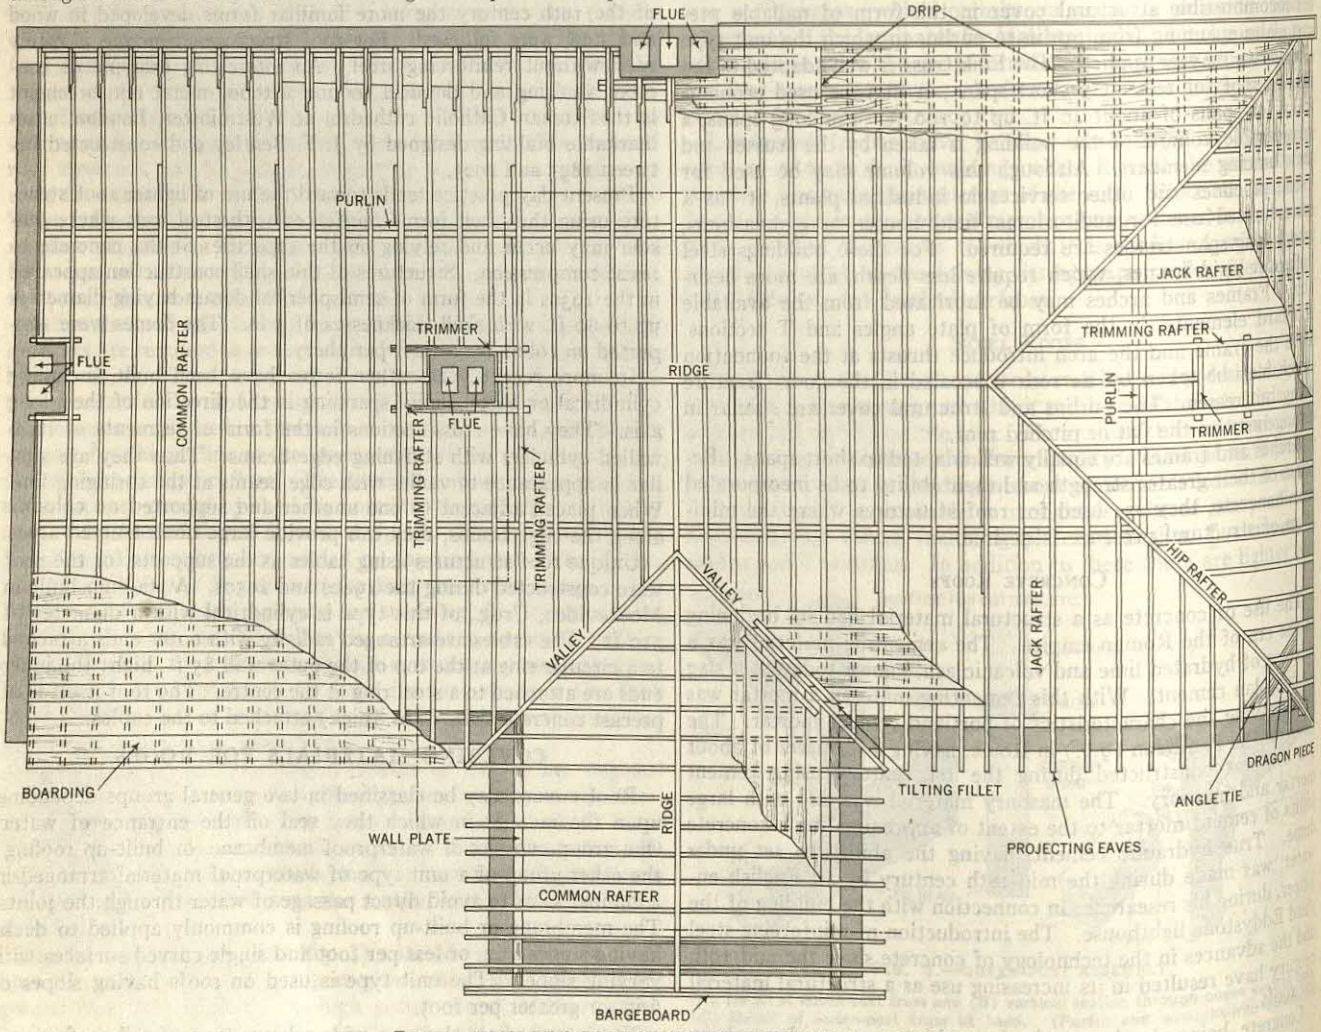

FIG. 5.—PLAN OF A ROOF SHOWING THE DETAILS OF CONSTRUCTION

2 in. per foot. The distance between supports may be 54 in., and the method of fixing is similar to that used for metal corrugated

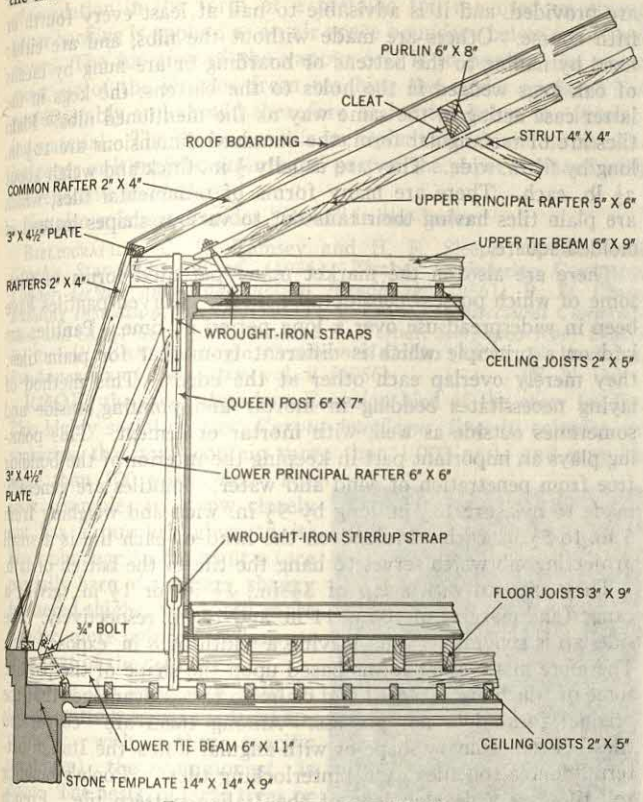

FIG. 6.—MANSARD ROOF TRUSS

sheets. The sheets are manufactured in 42 in. width, ranging in length from 3 ft. to 11 ft.

Zinc.—Zinc in sheets is a material largely used as a roof covering and, if care is taken to select metal of good quality, is strong and durable as well as light and relatively inexpensive. Zinc is stronger weight for weight than lead, slate, tile or glass, but weaker than copper, wrought iron or steel, although with the exception of the latter two it is not so durable under normal roofing conditions. It is not liable to easy breakages as are slates, tiles and glass. It is usually supplied in flat sheets, and may be had in corrugated form. When exposed to air a thin coating of oxide is formed on the surface which protects the metal beneath from further change and obviates the necessity of painting. In laying the sheets, the use of solder and nails should be avoided entirely except for fixing clips and tacks which do not interfere with the free expansion and contraction of the sheets. Zinc expands and contracts freely with changes in temperature; sheets laid with soldered seams or fixed with nails are liable to buckle, thus causing the zinc to become brittle and after repeated buckling to break away.

Zinc sheets are usually 7 ft. or 8 ft. long by 3 ft. wide, weighing from 11½ oz. to 25 oz. per square foot. The thickness varies from 25 to 19 standard wire gauge. A dependable method of laying zinc on flat roofs is with the aid of wood rolls, about 2 in. by 2 in. in section, splayed at the sides, spaced 2 ft. 8 in. apart and fixed to the roof boarding with zinc nails.

The sheets of zinc are laid between the rolls with sides bent up 1½ in. or 2 in. against them, and held firmly in position by clips of zinc attached to the rolls. A cap of the same metal is slipped over each roll; tacks about 3 in. long, which are soldered inside the cap, hook it under the same clips that anchor the sheet.

Drips of about 2½ in. are made in the slope at intervals of 6 ft. or 7 ft., *i.e.*, the length of the sheet, and care must be taken at these points to keep the work waterproof. The lower sheet is bent up to the face of the drip and under the projecting portion of the upper sheet, which is finished with a rolled edge to turn the water. The end of the roll has a specially folded cap which also finishes with a curved or beaded water check, and this, in conjunction with the saddle piece of the wood roll beneath, forms a weatherproof joint (fig. 8). The fall between the drips is usually about 1½ in. deep, but where necessary it may be less, the least permissible fall or slope being about 1 in 80. Felt laid beneath the zinc has the effect of lengthening the life of the roof and should always be used, as the edges of the boarding upon which it is laid are, when warped, apt to cut the sheets. It also forms a cushion protecting the zinc if there is traffic across the roof.

Lead.—Sheet lead forms a much heavier roof covering than other sheet metals, but it lasts a great deal longer and more easily withstands the attacks of impure air. Lead must be laid on a close boarding, for its great ductility prevents it from spanning even the smallest spaces without bending and giving away. This characteristic of the metal, however, conduces largely to its usefulness and enables it to be dressed and bossed into awkward corners without the necessity of jointing. The coefficient of expansion for lead is nearly as great as that for zinc and much higher than for iron; precautions to allow free expansion and contraction must be taken when laying the lead covering. The manner of laying is with rolls and drips as in the case of zinc, the details of the work differing somewhat to suit the character of the material (*see* fig. 9); the use of nails and solder should be avoided as far as possible. Contact with iron sets up corrosion in lead and when nails are necessary they should be copper; screws should be brass. Lead is supplied in rolls of 25 ft. to 35 ft. long and up to 7 ft. 6 in. wide. That in general use varies from $\frac{1}{14}$ in. to $\frac{1}{7}$ in. in thickness. The weights most suitable for employment in roofing are 7 or 8 lb. per square foot for flats and gutters, 6 lb. for ridges and hips and 5 lb. for flashings.

Copper.—As a roof cover, copper is lighter, stronger and more durable than either zinc or lead. It expands and contracts less than these metals, and although not so strong as wrought iron or steel it is much more durable. From a structural point of view these qualities enable it to be classed as the best available metal for roof covering, although its heat-conducting properties require it to be well insulated by layers of felt and other nonconducting materials placed beneath the metal. On exposure to the air, copper develops a feature of great beauty in the coating of green carbonate which forms upon its surface and protects it from further decomposition. Perhaps the chief disadvantage in the use of copper has been its first cost, but account must be taken of the almost imperishable nature of the metal and of the less substantial framework that its light weight requires for support. Copper roofing should be laid in a similar manner to zinc, with wood rolls at intervals of 2 ft. 4 in. It is, however, often laid with welted seams. The general stock sizes of sheets are from 4 ft. to 8 ft. long and 2 ft. to 3 ft. wide. The thickness almost invariably used is known as 24 standard wire gauge and weighs 16 oz. per square foot. Thinner material would suffice, but with the increased cost of rolling, little would be gained by adopting the thinner gauge.

Slate.—Slate is a strong and very impermeable material, it is easy to split into thin plates suitable to laying, and its cost is comparatively low; these qualities have made it the most generally used of all materials for roof covering for many years.

Slates are cut to many different sizes varying in length from 10 in. to 36 in. and in widths from 5 in. to 24 in. There are perhaps 30 or more recognized sizes, each distinguished by a different name. In common practice those generally used are "large ladies," 16 in. by 8 in.; "countesses," 20 in. by 10 in.; and "duchesses," 24 in. by 12 in. Generally speaking, the rule governing the use of the different sizes is that the steeper the pitch the smaller the slate, and vice versa. Buildings in very exposed positions naturally require steeply pitched roofs, if they are to be covered and rendered weathertight by small lapped units of covering. Slates may be fixed by nailing at the head or at about the middle. The latter method is the stronger, as the levering effect of the wind cannot attain so great a strength.

The nails used in slating are important and the durability of work depends on good selection. They should have large flat heads. The most satisfactory are those made of a composition of copper and zinc, but others of copper, zinc, galvanized iron and plain iron are used. Those of copper are most durable but are soft and expensive. Zinc nails are soft and not very durable;

they will last for about 20 years. Iron nails even if galvanized are only employed in cheap and temporary work; they may be pre-

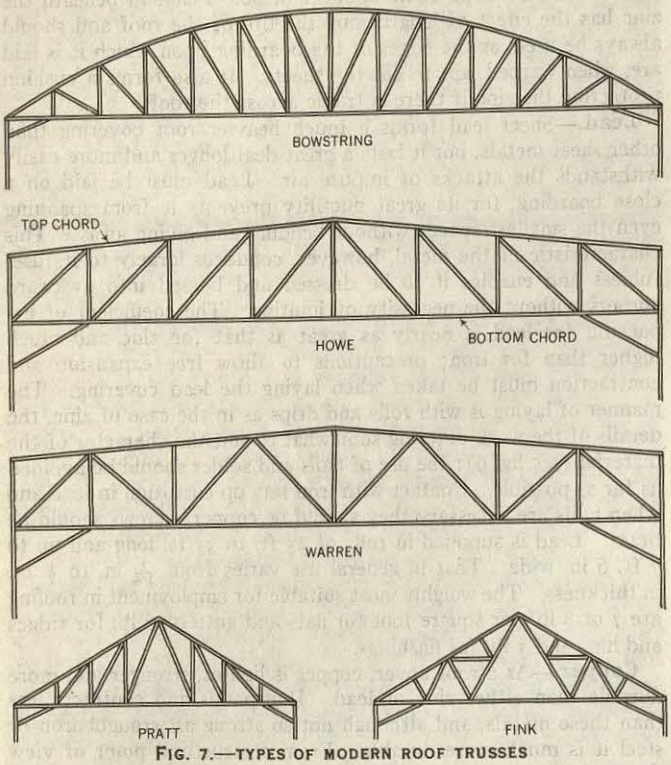

FIG. 7.—TYPES OF MODERN ROOF TRUSSES

served by being heated and plunged in boiled linseed oil. The pitch of a roof intended for slating should not incline less than 25° from the horizontal; for smaller sizes 30° is a safer angle. Modern slate roofs are frequently laid with varying courses and varying thicknesses, usually with the heavier slate from ¾ in. to 1½ in. thick at the eaves, with thinner and smaller slate in the upper part of the roof. Marked variation of colour is often sought by combining green and purple slate, or fading and unfading slate.

Tile.—Tiles for roofing purposes are made from clay and baked in a kiln like bricks. The clay from which they are made is, however, of a specially tenacious nature and prepared with great care so as to obtain a strong and nonporous covering. Tiles are obtainable in many colours, some having beautiful effect when fixed and improve with age. They comprise tints from yellowish red, red and brown to dark blue. As with brick, the quality depends to a large extent upon the burning; underburned tiles are weak and porous and liable to early decay, while overburning, though improving durability, will cause warping and variations in colour. Variation in colour is now deliberately obtained, and artistic effects are secured by sand facing, artificial rustication and by burning to metallic surfaces. The usual shape is the "plain tile," but they are made in other shapes for lighter weight and ornamental effect. There are also several patented forms on the market for which the makers claim special advantages. The ordinary tiles are slightly curved in the direction of their length to enable them to lie closely

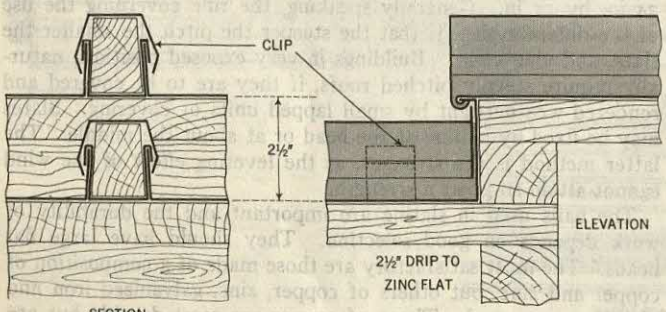

FIG. 8.—DETAILS OF ZINC FLATS

at their lower edges. Some of them have small nibs at the head by which they are hung upon the battens without nails. Nail holes are provided, and it is advisable to nail at least every fourth or fifth course. Others are made without the nibs, and are either fixed by nailing to the battens or boarding or are hung by means of oak kegs wedged in the holes to the battens, the kegs in the latter case acting in the same way as the mentioned nibs. Plain tiles are of rectangular form; the standard dimensions are 10½ in. long by 6½ in. wide. They are usually ½ in. thick and weigh about 2½ lb. each. There are many forms of ornamental tiles, which are plain tiles having their tails cut to various shapes instead of molded square.

There are also on the market many patented forms of tiles, some of which possess considerable merit. Curved pantiles have been in widespread use over a long period of time. Pantiles are laid on a principle which is different from that for plain tiles; they merely overlap each other at the edges. This method of laying necessitates bedding in mortar and pointing, inside and sometimes outside as well, with mortar or cement. This pointing plays an important part in keeping the interior of the building free from penetration of wind and water. Pantiles are generally made to measure 13½ in. long by 9½ in. wide and weighing from 5 lb. to 5½ lb. each. Molded on the head of each tile is a small projecting nib which serves to hang the tile to the batten or lath.

They are laid with a lap of 3½ in., 2½ in. or 1½ in., giving a gauge (and margin) of 10 in., 11 in. and 12 in., respectively. The side lap is generally 1½ in., leaving a width of 8 in. exposed face. There are many other forms based upon the shape of the pantile, some of which are patented and claim to have advantages that the original form does not possess. Among them are "corrugated tiles" of the ordinary shape or with angular flutes, the Italian pattern "double roll tiles" and "interlocking tiles." Poole's bonding roll tiles are a development of the Italian pattern tile. French and Belgian tiles of the "Marseilles" pattern are economical and therefore popular for housing schemes and cheap building.

There are other forms of roof covers that were once in common use but no longer meet the requirements set up by regulations and ordinances of most communities. Because of the risk of fire,

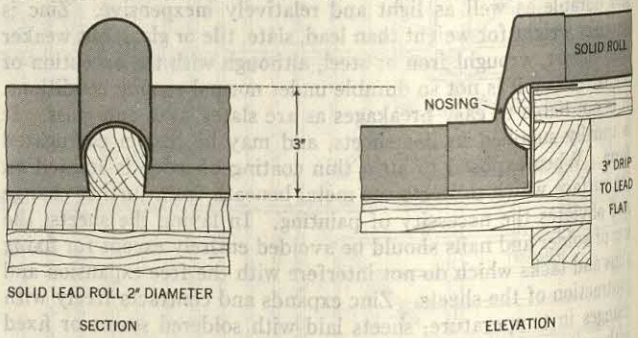

FIG. 9.—DETAILS OF LEAD FLATS

shingles of wood and other combustible materials have been replaced with asphalt and asbestos cement units. These coverings are available in many colours and textures as individual units or strips and sheets. The quality of the materials has been improved and the techniques of applying them developed to such a point that they have practically replaced the older types of roof coverings. The colours and textures of the older roofing, such as wood, slate and tile have been reproduced with limited success in the newer materials, but for the most part their acceptance has been the result of their own inherent characteristics.

Insulation has become an integral part of the roof assembly of most buildings; it is available in types adapted to various conditions of the roof structures. For the purpose of reducing the conductivity of the roof assembly a low density material composed of vegetable fibres, cork, glass fibres or mineral wool is formed into "rigid" units, semirigid units (batts) or flexible strips. The insulation for flat roofs having precast units or concrete structural covers is usually in the form of a rigid insulation board on which the built-up roofing is applied. For other types of structural roof

coverings, the insulation is usually a flexible type or it consists of batts applied below the structural roof cover. The reflective type of insulation in the form of a metallic foil mounted on strong paper backing is applied as an air space boundary below structural cover. The function of the vapour seal is to prevent the warm moist air of the interior from reaching the colder areas of the roof assembly and should therefore be located below the insulating material. The vapour seal is an asphalt membrane on sheathing paper or it may be an integral part of the paper surfaced with the reflective insulation.

ROOK, the most abundant Eurasian bird of the crow family. This highly social species, *Corvus frugilegus,* lives in colonies, or rookeries, that may contain more than 1,000 nests and may be more than 100 years old. The rook resembles the crow closely but has a purplish gloss to its black plumage, in the adult a face partially bare of feathers, shaggy feathered thighs, and a bill more slender, more pointed and grayer than that of the crow.

ERIC HOSKING
ROOK (CORVUS FRUGILEGUS)

Among the variety of calls in this gregarious species (often, apparently, with rather specific meanings) the commonest is *kaaa.* The nests, in large trees or on the walls of large old buildings, are soundly constructed of twigs and earth and are used year after year. The three to five light greenish eggs, thickly speckled with gray and brown, as with crows, are laid in April. Incubation is about three weeks, and the young require a month or more in the nest before the feathers have grown sufficiently to permit flight. Rooks are economically important since they consume great numbers of insects. After the nesting period, the rooks of several colonies may band together to feed, coming into a favourite site swiftly and in zigzag fashion. In Great Britain rooks are nonmigratory but over most of Europe they are migratory.

(W. J. BE.)

ROON, ALBRECHT THEODOR EMIL, GRAF VON (1803–1879), Prussian army officer who with Bismarck and Moltke brought the German Empire into being, and made Germany the leading power on the continent of Europe. As war minister in the 1860s, he reorganized the Prussian Army, thus contributing to its victories of 1866 and 1870–71. Roon was born at Pleushagen, near Kolberg (Kolobrzeg), on April 30, 1803. His family was of Flemish origin, and had settled in Pomerania. His father, an officer in the Prussian Army, died during the French occupation, and he was brought up mainly by his maternal grandmother. He became a cadet in 1816 and entered the military school in Berlin in 1818. He was commissioned in 1821 and spent the years 1824–27 at the Berlin War Academy. In 1832, after a short period of regimental duty, he joined the headquarters of the army corps at Krefeld. It was there that he first realized the inefficiency of the Prussian Army. In the same year, when only 29, he published the three-volume *Grundzüge der Erd-, Völker- und Staatenkunde* (3rd ed., 1847–55; "Principles of Physical, National and Political Geography"), which was widely read in Prussia and abroad. It is likely that it was at about this time that his ideas on remodeling the army germinated.

During the revolutionary disturbances of 1848 he served for a time under Crown Prince William (who became king as William I in 1861, and emperor of Germany in 1871) in suppressing the insurrection in Baden. This may be said to have been the beginning of his rise to the highest posts in the Prussian military hierarchy. By 1856 he was a major general, and by 1859 a lieutenant general and member of a commission to reorganize the army. Supported by Gen. Baron Edwin von Manteuffel, chief of the royal military cabinet, and by Gen. Helmuth von Moltke (*q.v.*), chief of the general staff, Roon shaped his plans for reform, and eventually got them adopted. His aim was an extension of the system of service started by Gen. Gerhard von Scharnhorst (*q.v.*). He envisaged a "nation-in-arms," with a three-year period of full-time service. This was unpopular both with the man in the street and with the more conservative members of the general staff. Until the Franco-German War of 1870–71 proved the effectiveness of his system, Roon was the most hated man in Prussia.

Toward the end of 1859 Roon became minister of war, and in 1861 also minister of marine. For the next few years he was engaged in creating the military machine which Moltke, as chief of staff, was planning to use (*see* also PRUSSIA: *The Kingdom from 1815*). The quick victory over Austria in 1866 showed the worth of the remodeled Prussian Army; it also exposed certain weaknesses which Roon was largely able to rectify by 1870.

During the Franco-German War, Roon spent much time in attendance on the emperor. He was made a count in 1871 and in December succeeded Bismarck as head of the Prussian ministry, but resigned in the following year because of ill-health. He was made a field marshal in January 1873. He died in Berlin on Feb. 23, 1879.

Roon was a man of massive build and aggressive appearance. He was a practical military administrator rather than a fighting soldier and liked to be known by his nickname of "the king's sergeant." He was also known as "ruffian Roon" by his political opponents.

ROORKEE, a municipal town in the Saharanpur district of Uttar Pradesh, India, lies 42 mi. (68 km.) SSW of Dehra Dun by road. Pop. (1961) 45,801 including the cantonment. There are two colleges affiliated to Agra University, and the town is the seat of Roorkee University which was originally founded in 1847 as the Thomason Civil Engineering College. The university was inaugurated in 1949 to provide for the teaching of all branches of engineering. The town is an important centre for the manufacture of surveying instruments and drawing equipment. It is the headquarters of the Ganges Canal workshops and also contains the Central Building Research Institute and an institute of irrigation research. It is well served by rail and road. (S. S. BH.)

ROOSENDAAL EN NISPEN, a town in the province of North Brabant, Neth., 15 mi. (24 km.) WSW of Breda by rail, at an important junction on the Rotterdam-Antwerp line. Pop. (1960) 38,355 (mun.). It is an industrial centre with comprehensive recreational facilities, whose growth has been encouraged by good communications. Chief products are fluorescent lighting components, hose fittings and assemblies, machinery for the paper and graphic industries, biscuits, sugar, cigars, brushes, and furniture. Its early development began when in 1268 the inhabitants of surrounding hamlets, including Nispen, were granted permission to build a church at Roosendaal. Peat-digging, mainly by the monks of Tongerlo (Belg.), gave the place its first prosperity.

ROOSEVELT, (ANNA) ELEANOR (1884–1962), wife of Pres. Franklin D. Roosevelt (*q.v.*) and a distinguished author, lecturer, and diplomat, was born on Oct. 11, 1884, in New York City, the daughter of Elliott Roosevelt (brother of Pres. Theodore Roosevelt) and Anna Hall Roosevelt. After the death of her parents she was cared for by her grandmother and sent to school in England. On March 17, 1905, when she married Franklin D. Roosevelt, a distant cousin, she was given away by her uncle, President Roosevelt. During her husband's public career, both in Albany and in Washington, Mrs. Roosevelt developed and later pursued an active interest in educational, sociological, and political affairs. She provided help and inspiration for her husband after 1921 in his struggle with the crippling effects of poliomyelitis.

When he became president of the United States in 1933 she created a new role in the White House for the first lady of the land. Her advocacy of liberal causes and her precedent-breaking activities made her a controversial figure throughout the next 12 years.

In 1945, after President Roosevelt's death, Pres. Harry S. Truman appointed Mrs. Roosevelt a delegate to the United Nations, where she served as chairman of a commission to draft the Universal Declaration of Human Rights, which was finally accepted by the UN in December 1948 (*see* HUMAN RIGHTS). She spent the next two years working on a proposed covenant that would bind all member nations to carry out the declaration. She resigned from the UN delegation in 1952 when a new administration came into office in Washington.

Mrs. Roosevelt was an indefatigable traveler. She circled the world several times, visited scores of countries, and met with most of the world leaders. In addition to lecturing extensively, both in the United States and abroad, often on behalf of the American Association for the United Nations, she wrote "My Day," a syndicated newspaper column, for many years. She was the author of numerous books and magazine articles and was the recipient of many awards and honorary degrees. For years she consistently led public opinion polls as the most admired woman in the world. She died at her home in New York City on Nov. 7, 1962.

See her autobiographical works, *This Is My Story* (1937) and *On My Own* (1958). (A. E. St.)

ROOSEVELT, FRANKLIN DELANO (1882–1945), served as 32nd president of the United States during the New Deal era and World War II, from March 1933 until his death in April 1945. To counter the great depression of the 1930s he helped formulate domestic policies that brought about substantial and lasting changes in the relationship of the U.S. government to the nation's economy. After the Japanese attack upon Pearl Harbor on Dec. 7, 1941, he led the United States and its allies in their struggle against the Axis powers; at the time of his death he was helping to establish the United Nations. He was the only president to be re-elected three times.

Early Life.—Roosevelt was born at Hyde Park, N.Y., Jan. 30, 1882, the only son of James and Sara Delano Roosevelt. James Roosevelt, a gentleman then in his fifties who had been an investor in railroads, coal lands and several speculative enterprises, was for some years vice-president of the Delaware and Hudson railroad, but was most deeply interested in his country estate. Sara Delano Roosevelt, only half the age of her husband, came from a wealthy family of New York and New England merchant shippers and developers of coal lands. The total wealth of the Roosevelt family was small compared with some of the huge fortunes of the day, but it placed them in the millionaire category and enabled the Roosevelts to live in unostentatious and genteel luxury, dividing their time between the Hudson river valley and European watering places. Young Franklin from the time he was three was taken to Europe for part of almost every year. He was taught privately at home and trained in French and German. Both in his education and in his recreation with members of a close social circle, he was reared to be a gentleman, maintaining his social position and being responsible toward those less fortunate.

At 14, Roosevelt, a rather shy youth, entered Groton school, modeled after the great public schools of England, where Rector Endicott Peabody trained rich young men to exercise Christian stewardship through public service. Roosevelt failed to make many friends at Groton and did not excel at sports, upon which there was much emphasis. But he did heed Peabody's exhortations, especially when they were reinforced by his glamorous distant relative, Theodore Roosevelt, a fifth cousin.

After he entered Harvard in 1900, Roosevelt was more successful in making friends and gaining the respect of his classmates. He threw himself with vigour into extracurricular activities, and in his senior year was chief editor (president) of the college newspaper, the *Harvard Crimson*. His strenuous extracurricular and social life left him relatively little time for his studies, in which his record was undistinguished. He was exposed to courses in economics in which classical laissez-faire doctrine was moderated by the new progressive faith in government regulation. These had a minor effect upon him compared with the direct influence of the vigorous, progressive president, Theodore Roosevelt, for whom he voted in 1904. During his final year at Harvard, young Roosevelt became engaged to President Roosevelt's niece, (Anna) Eleanor Roosevelt (*q.v.*), who was then active in settlement work in New York city. She helped open Roosevelt's eyes to the deplorable living conditions of the underprivileged in the slums. They were married on March 17, 1905.

New York social life interested Roosevelt more than his studies at Columbia university school of law. Nevertheless he survived into the spring of the third year despite a high failure rate among his classmates. But as soon as he passed the New York bar examinations he dropped his courses and did not bother to take his LL.B. degree. This indifference to the legal profession carried over into Roosevelt's years as a clerk with the distinguished Wall Street firm of Carter, Ledyard and Milburn, defense counsel in several spectacular antitrust cases.

Early Political Activities.—His admiration for Theodore Roosevelt, who continued to urge young men of substance to enter public service, led him toward politics. His opportunity came in 1910 when the Democratic leaders of Dutchess county, N.Y., persuaded him to undertake an apparently futile campaign for the state senate. Roosevelt, whose branch of the family had always been Democrats, hesitated only long enough to make sure his distinguished relative would not speak against him. He campaigned so strenuously that, with the aid of a Republican schism and his famous name, he won the election. Within a few days after he took his seat at Albany, Roosevelt, not quite 29, won state-wide and even some national attention by leading a small group of Democratic insurgents who refused to vote for the nominee of the New York city organization, Tammany Hall, for U.S. senator—William F. Sheehan, a Buffalo traction magnate. For three months Roosevelt helped hold the insurgents firm until Tammany switched to another candidate, James A. O'Gorman.

In this controversy he had acted basically as a conservative, clean-government Democrat in the Cleveland tradition, but had won the "insurgent" label popular among farmers because of the midwestern agrarian revolt bearing that name. Further, his struggle identified him with the fight for the direct election of U.S. senators and for the destruction of city bosses. In the ensuing two years in the New York senate, Roosevelt was the foremost champion of the upstate farmers, and in the process of fighting for legislation for them he became converted to the full program of progressive reform. From the New York city legislators whom he had earlier scorned and continued to fight, he learned much of the give-and-take of politics. Among them were James Walker, later mayor of New York city; Robert F. Wagner, who became a leading U.S. senator; and Alfred E. Smith, later governor of New York state. As he learned from men like these, Roosevelt gradually abandoned the patrician airs and superior attitude he had brought to the state senate.

Before the end of 1911, Roosevelt supported the presidential boom for Governor Woodrow Wilson of New Jersey, the leading Democratic progressive. An attack of typhoid fever kept him from participating in the campaign, but even without making a single public appearance he was re-elected to the New York state senate. This was because of the publicity an Albany newspaperman, Louis McHenry Howe, spread through the district. Howe, a wizened little man with a sharp tongue and clever pen, saw in the tall, handsome young Roosevelt a politician who could go far. Beginning with the campaign of 1912, he served Roosevelt the rest of his life with a jealous loyalty.

Assistant Secretary of the Navy.—For his work on behalf of Wilson, Roosevelt was rewarded in March 1913 with an appointment as assistant secretary of the navy under Josephus Daniels, a North Carolina newspaper editor. He loved the sea and naval traditions and knew more about them than his superior, who in a careful way was trying to bring progressive reforms to the peacetime navy. Roosevelt was frequently impatient with his superior, and tended to undercut him in minor ways. Nevertheless, Roosevelt himself, with mixed success, tried to bring reforms to the navy yards, which were under his jurisdiction, meanwhile learning with

marked success to negotiate with labour unions among the civilian employees. After war broke out in Europe, Roosevelt became a vehement advocate of preparedness and chafed under the deliberate policies of Secretary Daniels and President Wilson. During the war, he built a reputation as an effective administrator. In the summer of 1918 he made an extended tour of naval bases overseas. During much of his seven years as assistant secretary he had been less than loyal to Daniels, but in the end he came to appreciate his superior's skill in dealing with southern congressmen and his solid worth as an administrator.

Paralytic Attack and After.—At the Democratic convention in 1920, Roosevelt was nominated for vice-president. He campaigned vigorously with the presidential nominee, James M. Cox, on behalf of U.S. entrance into the League of Nations. After his defeat in the Republican landslide, he became a vice-president of the Fidelity and Deposit Company of Maryland, a bonding company, entered into numerous business schemes, some of a speculative nature, and remained active in Democratic politics. Suddenly, in Aug. 1921, while on vacation at Campobello Island, N.B., Roosevelt was severely stricken with poliomyelitis. He suffered intensely and for some time was almost completely paralyzed, but he refused to give way to depression and began gaily predicting (as he did for some years) that soon he would regain the use of his legs. His mother wished him to retire to Hyde Park, but his wife and his secretary, Louis Howe, felt it was essential to maintenance of his morale for him to remain active in his career and in politics. They won in the struggle over his future. Within two weeks after he was stricken with polio, Roosevelt was writing political letters. Since he could not himself attend political gatherings, Mrs. Roosevelt attended for him, acting as his eyes and ears (a service she frequently performed for him during the rest of his life). Under the tutelage of Howe, she overcame her shyness and became an effective political worker and speaker. Since for the time being he could not run for office, Roosevelt was able to function effectively as a sort of premature "elder statesman" trying to promote unity among the urban and rural wings of the Democratic party. Himself a rural Democrat, he nominated Gov. "Al" Smith of New York, the favourite of the city faction, at the 1924 and 1928 Democratic conventions.

After Smith received the presidential nomination in 1928, he urged Roosevelt to run for governor of New York in order to strengthen the ticket. Roosevelt was reluctant: he still could not walk without braces and assistance. In the years since 1921 he had worked incessantly to try to regain the use of his legs—with a doctor in Massachusetts, for several winters swimming in warm Florida waters and, beginning in the fall of 1924, in the mineralized water at Warm Springs, Ga. Wishing to share with others the beneficent effect of the warm water and a systematic program of therapy, Roosevelt in 1927 established the Warm Springs foundation, a nonprofit institution for the care of polio victims. He wished to develop Warm Springs further and to continue with his treatments in the hope of regaining full use of his legs; also, 1928 was not a propitious year to run on the Democratic ticket.

Governor of New York.—Nevertheless, Roosevelt succumbed to strong persuasion and accepted the nomination for governor of New York. It was a critical gamble. When he began campaigning by automobile, he demonstrated to his critics that he had retained his youthful buoyance and vitality; he also showed that during the years of struggle to recover from polio he had matured into a more serious and humane person. Opponents raised the question of his health against him but his vigorous campaigning effectively disposed of the issue. In the election, Smith was defeated nationally in the Hoover landslide and failed to carry New York state, but Roosevelt won by 25,000 votes.

When he succeeded Smith, who had been one of the most popular and successful governors in the history of New York, Roosevelt decided he must establish his own type of administration. He did not keep Smith's closest adviser, Belle Moskowitz, nor did he depend upon Smith for advice. Smith, already stung by his defeat for the presidency, was hurt and alienated. Whereas Smith had built his reputation on administrative reform, Roosevelt concentrated upon a program to give tax relief to farmers and to provide cheaper public utilities for consumers. He succeeded in wresting from the Republican legislature approval for a power authority, which took initial steps toward the development of the enormous resources of the St. Lawrence river. The appeal of this program in upstate New York, coupled with the effects of the deepening depression, led to Roosevelt's re-election in 1930 by the overwhelming plurality of 725,000 votes.

During his first term as governor, Roosevelt's policies, except on the power issue, were scarcely further to the left than those of Pres. Herbert Hoover in Washington. But during Roosevelt's second administration, as the depression became more catastrophic in its effects, he acted vigorously to mobilize the machinery of the state government to aid the economy. In the fall of 1931 he obtained legislation establishing the Temporary Emergency Relief administration, the first of the state relief agencies. Throughout his four years, he was successful in most of his bouts with the Republican legislature, sharpening skills that would be vital if he were to become president. And increasingly, beginning with some slight speculation in Nov. 1928, he was being talked of as the most likely Democratic nominee in 1932. After his spectacular victory in 1930, he was so conspicuous a target for the Republicans and for rival Democratic aspirants that he had no choice but to begin immediately and quietly to obtain support for the convention. Since it took a two-thirds vote in the Democratic convention to nominate, it was relatively easy to stop a leading contender. While Howe conducted an intensive letter-writing campaign from New York city, James A. Farley, a leader in the New York state Democratic organization, conducted skilful negotiations with Democratic leaders throughout the country. It soon became apparent that Roosevelt's strongest opposition would come from urban and conservative eastern Democrats who were still loyal to Smith; his strongest support was in the south and the west.

Progressives and intellectuals found Roosevelt's over-all program attractive, but many feared he was weak because he sidestepped Republican challenges to use his gubernatorial powers to oust corrupt Democratic officials in New York city. The opposition became stronger when the Texas favourite son, John Nance Garner, speaker of the house of representatives, won the California primary. At the 1932 convention, Roosevelt had a majority of the delegates but could be blocked by a combination of the Smith and Garner forces. On the third ballot, Garner prevented a deadlock by allowing his delegates to be thrown to Roosevelt. In return, Garner was nominated for the vice-presidency.

Election of 1932.—In the campaign of 1932 the depression was the only issue of consequence. Prohibition, which had split the Democratic party into the wet urban and dry rural factions through the 1920s, was no longer vital; the platform pledged repeal. Roosevelt, displaying smiling confidence, campaigned throughout the country, outlining in general terms a program for recovery and reform that came to be known as the "New Deal" (*q.v.*). In a series of careful addresses prepared by a team of speech writers popularly called the "brain trust," he promised aid to farmers, public development of electric power, a balanced budget and government policing of irresponsible economic power. He declared in his most notable speech in San Francisco: "Private economic power is . . . a public trust as well." It was a program appealing to millions who were nominally Republicans, especially western progressives. In response, President Hoover, campaigning for re-election, outlined his own program for remedying the depression, and he likened Roosevelt's inconsistencies on the tariff to a chameleon on plaid. It was Hoover's personal unpopularity more than Roosevelt's persuasiveness that led to the heavy Democratic victory in Nov. 1932. Roosevelt received 22,822,000 popular votes to 15,762,000 for Hoover. The electoral vote was 472 to 59. The Democrats also won substantial majorities in both houses of congress.

Inauguration as President.—Since the 20th amendment to the federal constitution had not yet gone into effect, Roosevelt did not take office until March 4, 1933. During the intervening months President Hoover sought his co-operation in stemming the deepening economic crisis that culminated in the closing of banks in several states during Feb. 1933. But Roosevelt refused either

BROWN BROTHERS

to accept responsibility without the accompanying power or to subscribe to Hoover's proposals for reassuring business; Hoover himself granted that his proposals would mean "the abandonment of 90 per cent of the so-called new deal."

Thus it was at a time of acute economic crisis and despair that Roosevelt, whose policies were still relatively unknown and untested, came to the presidency. Most of the nation's banks were closed, industrial production was down to 56% of the 1929 level, 13,000,000 or more persons were unemployed and farmers were in desperate straits. Roosevelt, during the months since his election, had been planning wide-ranging measures to meet the crisis. He chose a cabinet which reflected his desire to hold the support of Republican progressives who had campaigned for him and maintain a balance among the political and economic forces in the nation. The cabinet included three Republicans—Secretary of Agriculture Henry A. Wallace, Secretary of the Interior Harold L. Ickes and Secretary of the Treasury William Woodin. For the first time in history the cabinet included a woman, Secretary of Labour Frances Perkins. The other members were Democrats representing both the liberal and conservative forces in the party, some coming from the south and west and others from the east.

In his inaugural address Roosevelt promised prompt, decisive action and somehow conveyed to the nation some of his own unshakable self-confidence. "This great Nation will endure as it has endured, will revive and will prosper," he asserted, ". . . the only thing we have to fear is fear itself." For the moment, people of all shades of political views were Roosevelt's to command, and he acted swiftly to obtain enactment of the most sweeping peacetime legislative program in U.S. history.

The Hundred Days.—The prelude was the enactment of several conservative measures to inspire confidence among businessmen and bankers. First, Roosevelt ended depositors' runs on banks by closing all banks until congress, meeting in special session on March 9, could pass a cautious measure allowing those in a sound condition to reopen. In the ensuing two years, the Reconstruction Finance corporation (RFC), established in the Hoover administration, bolstered banks with loans and purchases of bank stock totaling $2,000,000,000. Most weak banks had been eliminated and few survivors failed thereafter. Banking reform came later through the Glass-Steagall act of June 1933, designed to curb speculation by banks and to establish, with Roosevelt's reluctant approval, the Federal Deposit Insurance corporation (FDIC) guaranteeing deposits. The Banking act of 1935 reorganized and increased the powers of the Federal Reserve system. In March 1933, Roosevelt redeemed two campaign pledges by introducing a program of drastic government economy and proposing legislation to legalize beer of 3.2% alcoholic content. By Dec. 1933 the 21st amendment had been ratified, repealing the 18th (prohibition) amendment (*see* PROHIBITION).

The initial measures of the new administration helped to restore confidence in the economy but did little to bring real recovery. It was only after their enactment that Roosevelt sent to congress a series of messages and draft bills proposing the program that comprised the early New Deal. This program, proposed and enacted in approximately the first 100 days of the new administration, represented Roosevelt's effort as president to provide for all the diverse economic groups in the nation. He intended through these laws to bring quick recovery and to eliminate some of the causes of depressions.

The main emphasis in the early days of the New Deal was on recovery but some attention was also given to reform. First of all, federal funds were appropriated for the relief of human suffering. Congress established the Federal Emergency Relief administration (FERA) and appropriated approximately $500,000,000 for its operation. Roosevelt appointed as its administrator Harry Hopkins, who granted funds to state relief agencies for direct relief. Congress also established a Civilian Conservation corps (CCC) which at its peak employed 500,000 young men in reforestation and flood-control work. Mortgage relief aided other millions of persons. Roosevelt consolidated existing farm credit agencies into the Farm Credit administration (FCA), which in two years refinanced one-fifth of the nation's farm mortgages. The Frazier-Lemke Farm Bankruptcy act enabled farmers who had lost their property to regain it. A sixth of the nation's homeowners, threatened by mortgage foreclosure, were aided by the Home Owners' Loan corporation (HOLC) established in June 1933. Congress in 1934 established the Federal Housing administration (FHA) to insure mortgages on new construction and home repairs. The key loan agency of the New Deal was the previously established RFC, whose powers were broadened so that it could make loans to small enterprises as well as to large. Under the sound management of Jesse Jones, it loaned $15,000,000,000 between 1932 and 1941, and most of this total was ultimately repaid. These relief agencies poured so much money into the economy that they did stimulate recovery. At the time, Roosevelt did not envisage public spending as their primary role; he hoped to be able to cut back their activities in order to balance the budget.

Recovery Measures.—The key recovery measures of the New Deal were two acts: one to restore farm prosperity and the other to stimulate business enterprise. The first act established the Agricultural Adjustment administration (AAA), whose objective was to raise farm prices and increase the proportion of the national income going to farmers. It was administered by Wallace, who was later to become a highly controversial figure in politics. Through the "domestic allotment" scheme favoured by the major farm organizations, growers of seven basic commodities (wheat, cotton, corn, hogs, rice, tobacco, and milk and dairy products) would receive subsidies in return for reducing production. The subsidies were to be paid from a processing tax on the commodities. Through the original

"LOOKS AS IF THE NEW LEADERSHIP WAS REALLY GOING TO LEAD"

A contemporary comment on the flurry of governmental activity during the first hundred days of the Roosevelt administration

law of 1933 and subsequent farm legislation, plus the effects of years of drought, production fell and farm income gradually improved. But it did not reach even the inadequate level of 1929 until 1941.

The demand of businessmen for government stabilization resulted in passage of the National Industrial Recovery act (NIRA) of 1933. It was a two-pronged program. One side was a $3,300,000,000 appropriation for public works. Had this money been poured into the economy rapidly it would probably have done much to bring recovery, but Roosevelt, not grasping this possibility, appointed Ickes as head of the Public Works administration (PWA) and approved his slow and cautious selection of projects. The other side was a National Recovery administration (NRA) to administer codes of fair practice within given industries. While the codes were being negotiated by industrial committees, Roosevelt and the administrator of the act, Hugh Johnson, called upon the nation to accept an interim blanket code establishing for workers a 35- or 40-hour week, minimum pay of 30 or 40 cents an hour and a prohibition of child labour. The codes, as they were slowly negotiated, were designed to stabilize production and raise prices in industries such as bituminous coal and textiles and to protect labour and consumers. The consumers received scant protection. Labour received guarantees on wages and hours, and also, through sec. 7a of the act, the right to bargain collectively. During the summer of 1933 there was a quick flurry of recovery as manufacturers produced goods in anticipation of sale at higher prices under the codes; the boom collapsed by fall, for prices had risen faster than purchasing power. By Feb. 1934 code-making was over, but far too many—557 basic codes and 208 supplementary ones—had come into existence, containing innumerable provisions difficult to enforce. The business community, which had demanded the NRA at the outset, by 1935 was becoming disillusioned with it and blaming its ineffectiveness on Roosevelt. In May 1935 the supreme court of the U.S. in the Schechter decision invalidated the code system. Despite its shortcomings, the NRA had brought significant aid to several highly competitive industries like textiles and important reforms that were subsequently re-enacted in other legislation: federal wages-and-hours regulation, collective bargaining guarantees and abolition of child labour in interstate commerce.

In the fall of 1933, with recovery still beyond grasp, Roosevelt had already turned to other expedients for bolstering the economy. He experimented with "managed currency," driving down the gold content of the dollar, and tripling the price of silver through large purchases. These efforts brought little increase of prices at home but they improved the position of the United States in foreign trade by making dollars cheaper abroad. Also, silver producers received a continuing subsidy through the Silver Purchase act of 1934. In Jan. 1934 Roosevelt stabilized the gold content of the dollar at 59.06% of its earlier value. The resort to managed currency created a significant precedent even though it did little to bring recovery at the time.

Altogether, Roosevelt's program by the fall of 1934 was bringing a limited degree of recovery, but it was alienating conservatives, including many businessmen. They contended that much of the Roosevelt program was unconstitutional, that it created uncertainties for business which hampered recovery and that the lowering of the gold content of the dollar had deprived holders of government obligations of their just return. At the same time, many of the underprivileged who were still in serious difficulties felt that the New Deal had not gone far enough. They were ready to listen to demagogic leaders offering still more. In the election of 1934, they voted overwhelmingly for Democratic candidates for congress, adding to the already top-heavy New Deal majorities. But in the 1936 presidential election they might vote for a third-party candidate to the left of Roosevelt.

Reform Measures.—In order to meet the threat to his political coalition from the left, Roosevelt in his annual message to congress in Jan. 1935 put the emphasis upon reform. This was less a sharp shift from a first to a second New Deal than it was a hurry to enact a number of reform measures which Roosevelt had long been planning. In the first days of the New Deal, in the spring of 1933, congress had created the Tennessee Valley authority (TVA), to provide flood control, cheap hydroelectric power and regional planning for an impoverished region. Also, two laws had been passed to protect investors: the "Truth in Securities" act of 1933 and an act establishing the regulatory Securities and Exchange commission (SEC) in 1934. The additional legislation of 1935 did much to undermine the appeal of demagogues to the needy. This was especially true of the Social Security act of 1935, which included not only unemployment insurance as had been originally proposed but also old-age insurance. In some respects it was the most significant and far-reaching of the New Deal measures. For workers still unemployed, congress created the Works Progress administration (WPA) to provide them with work relief to stem the erosion of their skills and self-respect. Between 1935 and 1941 the WPA employed an average of 2,100,000 workers and by the end of 1935 was already bringing a marked measure of recovery through pouring billions of dollars into the economy. For workers who were employed, the Wagner act (National Labor Relations act) of 1935, only belatedly accepted by Roosevelt, strengthened the government guarantees of collective bargaining and created a National Labor Relations board (NLRB) to adjudicate labour disputes. The Holding Company act of 1935 eliminated all but two strata of holding companies above operating public utility companies. A new 1935 tax measure, labeled by its opponents the "soak the rich" tax, raised the levies on people of large incomes and on big corporations, and became a significant factor in redistributing American income.

These measures effectively undercut the left-wing opposition to Roosevelt but they further alienated conservatives. When he ran for re-election in 1936, it was with the firm support of farmers, labourers and the underprivileged; the epithets which the extreme right hurled at him merely helped to unify his following. The Republican nominee, Gov. Alfred M. Landon of Kansas, was a moderate who promised greater efficiency rather than destruction of the New Deal program; he could do little to stem the Roosevelt tide. Roosevelt received 27,752,000 popular votes to 16,680,000 for Landon, and carried every state except Maine and Vermont.

Second Term.—The only hope of the conservatives to thwart the New Deal was that the supreme court would invalidate its key measures. Following the Schechter decision ending the NRA codes in 1935, the court in 1936 ruled against the AAA processing taxes, thus forcing the administration to base crop restriction payments upon soil conservation instead. Cases challenging the Social Security act and the Wagner act were pending before the court. Roosevelt, in beginning his second term with a massive mandate, was determined to remove this threat to the New Deal program. He reasoned that the measures were well within the scope of the constitution and that it was the reasoning of the justices that was old-fashioned and at fault. Consequently, early in 1937 after an inaugural dedicating his second administration to reform on behalf of the underprivileged third of the nation, he proposed the reorganization of the supreme court, including the appointment of as many as six new justices. The proposal, labeled by its opponents as a "court-packing" scheme, touched off a vehement debate in which many of Roosevelt's previous supporters in and out of congress expressed their opposition. While the debate was continuing, in the spring of 1937, the supreme court handed down decisions upholding both the Wagner act and the Social Security act. With the need for the court plan dissolving, its enemies managed by summer to bring about its defeat. This was a severe political blow for Roosevelt, even though the new decisions by the court opened the way for almost unlimited government regulation of the economy.

Roosevelt's prestige suffered still further in the summer of 1937 as much of the public blamed him for the labour difficulties that grew out of the great organizing drives in the steel, automobile and other mass-production industries. (*See* AMERICAN FEDERATION OF LABOR-CONGRESS OF INDUSTRIAL ORGANIZATIONS.) Operating under the protection of the Wagner act, the unions engaged in strikes which often reached their climax in violence. Roosevelt himself preferred paternalistic government aid to all workers, such as the wages and hours guarantees of the Fair Labor

Standards act of 1938. But while union membership jumped to about 9,500,000 by 1941, most middle-class people returned to the Republican party. A sharp economic recession in the fall of 1937 added to Roosevelt's troubles. There had been a substantial degree of recovery by 1937, but Roosevelt, wishing to balance the budget, had curtailed government spending so drastically that he had sent the economy plummeting back toward 1932 levels. Businessmen blamed the New Deal spending policies; Roosevelt blamed the businessmen and inaugurated an antimonopoly program. But in Oct. 1937 massive government spending began again, and by June 1938 the crisis was past.

Adding to Roosevelt's troubles, many of the conservative southern Democrats heading key congressional committees, from 1937 on, were openly opposing the New Deal. In 1938 Roosevelt tried unsuccessfully to defeat several of them in the primaries, and was inveighed against as a dictator trying to conduct a "purge." Democrats won the November elections, but the Republicans gained 80 seats in the house and 7 in the senate. Republicans and conservative Democrats by coalescing could thwart the president.

Nevertheless, the second Roosevelt administration saw the passage of some notable reform legislation, less spectacular than that of the first four years but extending and improving the earlier legislation and moving into some new fields. These years also saw the development of soil conservation to stem erosion and the large-scale construction of public works, including public housing and clearance of slums. Many of the New Deal innovations, such as social security, the agricultural program, the TVA and the SEC, became accepted as permanent functions of the federal government. Clearly, the government was expected thereafter to play a much larger part in U.S. economic life.

Foreign Policy.—By 1939, foreign policy was overshadowing domestic policy as it became clear that war threatened in Europe. Even before Roosevelt took office he had endorsed the Hoover administration's refusal to recognize Japanese conquests in Manchuria. From the outset of his administration, he was deeply involved in foreign policy questions. Most of these centred around the depression. In the early summer of 1933 he refused to support international currency stabilization at the London Economic conference, but by 1934 he had stabilized the dollar and had begun helping France and Great Britain to keep their currencies from being undermined by dictator nations. In Nov. 1933 Roosevelt recognized the government of Soviet Russia in the mistaken hope that he could thus promote trade. Greater opportunities seemed to exist in negotiating reciprocal trade agreements with numerous nations, a program which began in 1935, and in fostering more cordial relations with Latin-American nations. In his inaugural address Roosevelt had pledged himself to the "policy of the good neighbor." Secretary of State Cordell Hull interpreted this to mean that the United States would not unilaterally intervene in Latin-American nations. Gradually, as European war became imminent, the Good Neighbor policy led to collective security and mutual defense agreements.

PRESIDENT FRANKLIN D. ROOSEVELT DURING HIS SECOND TERM

In the early New Deal years, Roosevelt was not only pursuing programs of economic nationalism but, like most of the American people, was also intent upon keeping the United States out of any impending war. Consequently he supported a series of neutrality laws, beginning with the Neutrality act of Aug. 1935. Roosevelt desired legislation that would enable him to withhold war supplies from an aggressor but sell them to the victim; congress, however, insisted upon a mandatory embargo against both. In Aug. 1936, a month after the outbreak of the Spanish Civil War, Roosevelt declared, "We are not isolationists except in so far as we seek to isolate ourselves completely from war. . . . I hate war."

In 1937 Roosevelt moved toward a new policy when Japan began a new major thrust into northern China. Until then, he had been relatively conciliatory toward Japan, except that he had supported vigorously legislation to strengthen the U.S. navy. In Oct. 1937, speaking in Chicago, Roosevelt proposed that peace-loving nations make concerted efforts to quarantine aggressors. He seemed to be thinking of nothing more drastic than breaking off diplomatic relations, but the proposal created so much national alarm that during ensuing months he was slow to develop a collective security position. He quickly accepted Japanese apologies when the U.S. gunboat "Panay" was sunk on the Yangtze river in Dec. 1937. Gradually relations between the United States and Japan worsened, but the rapid domination of Europe by Adolf Hitler of Germany was more threatening.

The Outbreak of War.—When World War II began with Germany's invasion of Poland in Sept. 1939, Roosevelt called congress into special session to revise the Neutrality act to permit belligerents to buy arms on a "cash and carry" basis. Through the quiet winter of 1939–40 this aid to Great Britain and France seemed adequate, and Roosevelt pressed congress for only moderate increases in armaments appropriations. With Hitler's sudden invasion of Denmark, Norway and the Low Countries, and the fall of France in the spring and early summer of 1940, Roosevelt and congress turned to defense preparations and "all aid short of war" to Great Britain. Roosevelt, convinced that a victory by Germany and Italy would be disastrous to the United States, even gave Great Britain 50 over-age destroyers in exchange for eight western-hemisphere bases. Isolationists, who feared that these moves would involve the United States in war, debated hotly with those who felt that national self-interest demanded aid to Britain. To strengthen the defense effort and to give his administration a bipartisan colouring, Roosevelt in June 1940 appointed two prominent Republicans to his cabinet—Henry L. Stimson as secretary of war and Frank Knox as secretary of the navy. For the presidential campaign of 1940 the Republicans nominated Wendell Willkie, who heartily agreed with Roosevelt's foreign policy. Nevertheless, as both candidates pledged they would keep the nation out of foreign war, isolationists tended to support Willkie, and many of those favouring strong measures against Hitler swung toward Roosevelt. By a closer margin than before, 27,244,000 to 22,305,000 and 449 electoral votes to 82, Roosevelt was elected to an unprecedented third term.

Third Term.—Through 1941 the nation moved gradually closer toward actual belligerency with Germany. After a bitter debate in congress, Roosevelt in March 1941 obtained the Lend-Lease act, enabling the United States to finance aid to Great Britain and its allies. In June 1941 Hitler launched a huge surprise attack against the U.S.S.R., and in September, Roosevelt extended lend-lease to the Soviet Union. Preventing submarines from sinking goods en route to Europe gradually involved more drastic protection by the U.S. navy; by the fall of 1941 the United States was engaged in an undeclared war against German submarines in the Atlantic. Meanwhile, in August on a battleship off the Newfoundland coast, Roosevelt met with Prime Minister Winston Churchill of Great Britain, and signed a joint press release proclaiming an Atlantic

Charter (*q.v.*) to provide national self-determination, greater economic opportunities, freedom from fear and want, freedom of the seas, and disarmament.

Yet it was in the Pacific that war came to the United States. Japan, bound in a treaty of alliance with Germany and Italy, the so-called Axis, quickly capitalized upon Hitler's victories in Europe to extend its empire in east Asia. Roosevelt, viewing these moves as part of Axis world aggression, began to deny Japan supplies essential to its war-making. Japan was regarded as a relatively mediocre power; the danger that it could launch a damaging retaliatory attack seemed light. Throughout 1941 the United States negotiated with Japan, but the proposals of each side to the other were unsatisfactory. Roosevelt did not want war with Japan in the fall of 1941, but he miscalculated in thinking the Japanese were bluffing. By the end of November, he knew that Japanese fleet units and transports were at sea and that war was imminent; an attack in southeast Asia and perhaps on the Philippines seemed likely. To Roosevelt's angered surprise, the Japanese on Dec. 7, 1941, struck Pearl Harbor, Hawaii. (*See* PEARL HARBOR ATTACK.)

WIDE WORLD

PRESIDENT ROOSEVELT ASKING CONGRESS TO DECLARE WAR ON JAPAN, DEC. 8, 1941

As millions of Americans listened to their radios, Roosevelt on Dec. 8, 1941, told congress, "Yesterday, December 7, 1941—a date which will live in infamy—the United States of America was suddenly and deliberately attacked by the naval and air forces of the Empire of Japan." Congress voted a war resolution within four hours; on Dec. 11, Germany and Italy declared war on the United States.

As a war leader, Roosevelt made concessions to the conservatives in congress in order to obtain support in prosecuting the war. Several New Deal agencies were abolished. At a press conference, Roosevelt asserted that "Dr. Win the War" had taken the place of "Dr. New Deal." But apparently this was to be only for the duration of the war, and meanwhile Roosevelt fought resourcefully although not always successfully against inflationary pressures. One of the immediate problems after Pearl Harbor was to build up massive production for war. Since 1939, Roosevelt had been experimenting with various defense agencies to mobilize the economy. Conservatives wished to take some of the control of these agencies out of the president's hand, but he firmly refused to allow it. The lines of authority in the agencies sometimes overlapped, and their powers were not always clearly defined, but in the end a workable organization evolved. Key among these were the War Production board (WPB) established in Jan. 1942 and the Office of War Mobilization (OWM) in May 1943. At the time of Pearl Harbor, U.S. war production was already nearly as great as that of Germany and Japan combined; by 1944 it was double the total of all Axis nations. (*See* MOBILIZATION, ECONOMIC.)

Relations With Allies.—During the war, Roosevelt concentrated upon problems of strategy, negotiations with the nation's allies and the planning of the peace. At the outset, he took the lead in establishing a grand alliance among all countries fighting the Axis. On Jan. 1, 1942, the United States and its allies signed a Declaration of the United Nations, reiterating the war aims of the Atlantic Charter. Twenty-six nations signed immediately, and 20 more before the end of the war. In the realm of strategy, Roosevelt depended heavily upon the advice of his top military leaders, the Joint Chiefs of Staff. As early as 1940, the United States had decided that in case it were involved in global war, it would concentrate upon Germany, which had greater war production and was a greater military threat. Roosevelt stood by this decision but did not allow it to interfere with vigorous prosecution of the war against Japan.

Upon Roosevelt personally there fell heavy responsibility for the maintenance of effective working relations with the nation's allies. With Great Britain this was easy. Roosevelt met with Churchill in a number of wartime conferences at which differences were settled amicably. Debate at the earlier conferences centred upon the question of a landing in France, which the British succeeded in postponing repeatedly until at length the great Normandy invasion was launched in June 1944. Meanwhile the United States had followed the British lead in invading North Africa in Nov. 1942, Sicily in July 1943 and Italy in Sept. 1943. At one of the most significant of the meetings, at Casablanca, Mor., in Jan. 1943, Roosevelt, after previous consultation with Churchill, proclaimed the doctrine of unconditional surrender of the Axis. What he seemed to want was to avoid differences of opinion among the United Nations and German misunderstanding later, of the sort that had made trouble at the time of the 1918 Armistice. The unconditional surrender doctrine left the United Nations free to lay down whatever peace terms they wished. These were not extremely harsh, though Nazi propagandists warned that they were; nor is there any tangible evidence that the doctrine in any way lengthened the war. (*See* WORLD WAR II CONFERENCES, ALLIED.)

Relations with the Soviet Union posed an exceedingly difficult problem for Roosevelt. Throughout the war the U.S.S.R. accepted large quantities of lend-lease supplies but seldom divulged its military plans or acted in co-ordination with its western allies. Roosevelt, feeling that the maintenance of peace after the war depended upon friendly relations with the Soviet Union, hoped to win Joseph Stalin's confidence. Outwardly, Roosevelt seemed to get along well with Stalin when at last he and Churchill met with the Soviet leader at Teheran in Nov. 1943. In their optimism, Roosevelt and Churchill seemed not to see realistically that the sort of peace being foreshadowed at Teheran would leave the U.S.S.R. dominant on the continent of Europe. Meanwhile, the Axis had been suffering serious defeats in both Europe and the Pacific. By Feb. 1945, when the Big Three met again at Yalta in the Crimea, the war seemed almost over in Europe, although Americans were still on the defensive in the Ardennes forest. As for Japan, the U.S. expectation was for a last-ditch defense that might require another 18 months or more of fighting. The main Japanese armies remained intact on the Asiatic mainland. Work in developing an atomic bomb was well advanced, but its power (if it worked) was expected to be only a fraction of what it actually turned out to be. Consequently, Roosevelt and his military advisers were eager to obtain Soviet aid in the far east, and in return for Stalin's promise to enter the war against Japan, Roosevelt and Churchill offered concessions in the far east. As for eastern Europe, earlier decisions were ratified, and plans were made for the establishment of democratic governments. Had the arrangements for eastern Europe been followed by Stalin in the manner expected by Roosevelt and Churchill, there would have been little room for criticism of this part of the Yalta agreements. But the understandings were not precise enough and immediately began to receive entirely different interpretations in the U.S.S.R. By mid-March, false Soviet accusations against the United States led Roosevelt to send a sharp telegram to Stalin.

Roosevelt's increasing hope during the war was that the establishment of an effective international organization, in which both the United States and the U.S.S.R. would co-operate, could maintain the peace in years to come. He planned to attend a conference of 50 nations at San Francisco to draft a United Nations charter, opening April 25, 1945. But since Jan. 1944 his health had been declining. His political opponents had tried to make much of this during the campaign of 1944 when he ran for a fourth term against Gov. Thomas E. Dewey of New York. But a final burst of vigour on Roosevelt's part seemed to refute the rumours. Roosevelt won by 25,602,000 to 22,006,000 in popular votes, and 432 to 99 in electoral votes. But by the time Roosevelt returned from Yalta to address congress, he was in such failing physical condition that he had to deliver his speech sitting. He went to Warm Springs, Ga., for a rest, and there on April 12, 1945, died of a massive cerebral hemorrhage.

U.S. ARMY FROM A.P.

PRESIDENT ROOSEVELT (CENTRE) AT THE YALTA CONFERENCE, FEB. 1945. PRIME MINISTER WINSTON CHURCHILL IS SEATED AT LEFT, PREMIER JOSEPH STALIN AT RIGHT. BEHIND THE PRESIDENT STANDS ADMIRAL WILLIAM D. LEAHY, ROOSEVELT'S CHIEF OF STAFF

Evaluation.—During his years as president, Roosevelt had relatively little time for personal life. He continued his interest in his lands at Hyde Park, where he experimented with the planting of trees, and served as vestryman of St. James Episcopal church. His zest for sailing and his enjoyment in collecting stamps and naval books and prints continued unabated. His family life was circumscribed by the tight schedule and incessant publicity imposed upon him as president, and at times this must have been a handicap to Mrs. Roosevelt and their children. Of these there were five: Anna Eleanor (Mrs. James Halsted; 1906–), James (1907–), Elliott (1910–), Franklin D., Jr. (1914–), and John A. (1916–). As a public figure, he was, at the same time, one of the most loved and most hated men in U.S. history. Opponents ascribed to him shallowness, incompetence, trickiness and dictatorial ambitions. His supporters hailed him as the saviour of his nation's economy and the defender of democracy not only in the United States but throughout the world. As a political leader, it was generally conceded, he was unexcelled in winning and holding popular support and in retaining, in his administration, leaders of diverse views. Many experts have expressed the opinion that, despite occasional confusion and overlapping authority, his administration was unusually effective. He brought even more than this to the office: in 1932 he stated what remained his view through peace and war, "The Presidency . . . is pre-eminently a place of moral leadership."

(FK. F.)

ROOSEVELT, THEODORE (1858–1919), 26th president of the United States, was born in New York City on Oct. 27, 1858. His father, of an old New York Dutch family, was a man of some wealth and importance in civic affairs; his mother, Martha Bulloch of Georgia, was of Scotch-Irish and Huguenot descent. To overcome the physical weakness and ill-health of his early life, young Roosevelt became an earnest devotee of physical culture. By the time of late adolescence, through sports and outdoor living, he had developed a rugged physique and a love of the strenuous life that he never lost. Meanwhile his family, through private tutoring and travel, had provided him with an excellent education. Roosevelt was one of the few presidents of the United States who was endowed with an encompassing intellectual curiosity and with a real sympathy for and an enjoyment of literature and the arts. After graduating from Harvard College in 1880, he married Alice Hathaway Lee of Boston and in the same year entered Columbia University Law School. But historical writing and politics soon enticed him away from a legal career.

EARLY CAREER

Roosevelt's lifelong desire for public acclaim, combined with the corrupt state of New York public life, led him to join a local Republican Reform Club. In 1881 he was elected to the New York Assembly where during the next three years he became the leader of a small group of "blue-stocking" opponents of the corruption and boss rule that typified both party machines. So successful was his legislative career that in 1884 he was his party's candidate for speaker of the Assembly and chairman of the New York delegation to the Republican national convention. Denouncing the leading Republican candidate, James G. Blaine, as an inveterate practitioner of the kind of politics he had been warring against in New York, Roosevelt vigorously supported Sen. George F. Edmunds at Chicago. But upon Blaine's nomination, Roosevelt, unlike many of his fellow reformers, supported Blaine and thus won a reputation for party loyalty. The death of his young wife in February 1884, and his defeat at Chicago, left him disconsolate and he retreated to the Dakota territory, where he lived the life of a gentleman rancher and sportsman and also continued his historical writing.

In 1886 politics called him back to New York where the Republicans nominated him as their candidate for mayor in a lively campaign against the liberal Democrat Abram S. Hewitt and the single-taxer Henry George, who was supported by labour and radical groups. Despite the divided opposition, Roosevelt ran third; for the next three years he kept out of politics and contented himself with his own personal affairs. He married Edith Kermit Carow and built a home at Sagamore Hill, near Oyster Bay, Long Island, where he was to live for the rest of his life.

Roosevelt found some balm for his three successive political defeats in his appointment by President Harrison as a member of the U.S. Civil Service Commission, a position he held from 1889 to 1895, when he accepted the presidency of the Board of Police Commissioners in New York City. Without quite alienating the professional politicians, Roosevelt added to his reputation as a reformer in both offices and was in a good position to claim some reward from the new administration of William McKinley, whose candidacy in 1896 Roosevelt had vigorously supported. It came in the form of his appointment as assistant secretary of the navy.

In this position Roosevelt distinguished himself by becoming a leading member of the jingo group in the Republican Party; he called for war with Spain and occasionally embarrassed his superiors with precipitate and unauthorized actions to strengthen the Navy. At the start of the Spanish-American War in April 1898 Roosevelt hurriedly resigned from his position to join his friend Leonard Wood (*q.v.*) in organizing the 1st U.S. Volunteer Cavalry, known as the "Rough Riders," and soon became their commander. Roosevelt's leadership of the cavalry regiment was nothing if not spectacular. His disdain for Army red tape and his impetuous charge up Kettle Hill during the battle for San Juan Hill did not endear him to his military superiors. But his colourful exploits, reports of which were widely circulated at home, made him something of a national hero.

Governor of New York.—As reentry into politics by the returning hero was almost inevitable, Thomas C. Platt, the Republican boss of New York, bowed to seeming necessity. Platt distrusted Roosevelt as "a perfect bull in a china shop," but he also needed a vote-winning, "respectable" candidate to remove the taint of fraud adhering to the incumbent administration. Two weeks after he was mustered out of the service Roosevelt was nominated for governor of New York and in November he was elected, by a very small majority, for a two-year term.

Before obtaining the nomination Roosevelt had met with Platt

and promised that he would not upset the hold of the machine on the party, a promise that was seriously to limit his actions. Nevertheless, his record in office was a good one. In most instances his appointments were superior, and his removal of the superintendent of insurance, one of Platt's supporters, on grounds of fraud, indicated that his promise had limits. Over Platt's opposition and from a reluctant legislature Roosevelt also secured one measure that taxed corporation franchises and a second that established a civil service system. During his two years' administration he so irritated the regular Republican organization that Platt contrived to bring about his nomination for vice-president in 1900 to remove him from New York state politics. Roosevelt accepted the nomination in part because he was outmaneuvered and in part because his renomination and election as governor could not be taken as at all assured.

ROOSEVELT AS PRESIDENT

All of Roosevelt's dreary expectations for the vice-presidency were fulfilled. Bored beyond measure in a position of idleness, he talked about returning to the study of the law or of becoming a university professor. Then on Sept. 14, 1901, President McKinley died in Buffalo, N.Y., after being shot by an assassin, and Roosevelt became president.

Although Roosevelt's first public announcement indicated there was to be no change from McKinley's policies, it was soon apparent that the new president would not follow the same course as his predecessor. Roosevelt was worried. He knew that Bryan's defeat in 1896 and the Spanish-American War had not quieted western demands for further control of trusts, for the regulation of railroads, and for a reduction in the tariff, and he was aware that the price of inactivity might be a catastrophe for the party in 1904 and defeat for himself. But he was also acutely aware that both the Senate and the House were tightly controlled by conservative Republicans who were bitterly opposed to western demands for reform. His answer to this perplexing situation was to ask for relatively little controversial legislation and to use his executive power to the full in appeasing the rising discontent.

The Anti-Trust Campaign.—For 12 years the Sherman Anti-Trust Act of 1890, originally passed to control the power of growing industrial and financial monopoly, had been virtually ignored by both government and industry. Then on Feb. 18, 1902, Roosevelt reinvigorated the statute and launched a campaign to restore competition in the business and financial world. On that date, without prior consultation with the private interests involved, the president, through his attorney-general, Philander C. Knox, brought suit against the giant railroad complex, the Northern Securities Company. Since this holding company had been put together by J. P. Morgan, John D. Rockefeller, Edward H. Harriman, and James J. Hill, the government was attacking the very citadel of U.S. finance capitalism and corporate business. On March 14, 1904, the attack was successfully brought home when the Supreme Court reaffirmed a decree of a federal circuit court ordering the dissolution of the Northern Securities Company.

For the next seven years of his administration Roosevelt vigorously used the Sherman Act against some of the nation's greatest industrial organizations. The U.S. Steel Corporation, the Standard Oil Company, and more than 30 other industrial combinations were summarily ordered into court. But almost from the first days of his administration Roosevelt realized that breaking up big business concerns was not alone the answer to the industrial problem. Growth in size, he contended, was an inevitable part of industrial evolution and, in fact, was socially desirable. What was wrong was the use of these great organizations against the public interest. Trusts that served the public interest were good; those that did not were bad. Far more basic was his demand for government regulation of industry. Roosevelt was the first U.S. president who envisioned the federal government as an umpire upholding the public interest in the conflicts among big business, big labour, and the consumer.

Regulation of Business.—In 1902 the president asked Congress to establish a federal Bureau of Corporations with power to inspect the books of private businesses and to give publicity to its findings when it found evidence of action against the public interest. Even this small step on the way to regulation was fought by the conservatives in Congress. To get even a part of his legislation enacted the president had to agree with the Republican leader of the Senate, Nelson W. Aldrich, that he would not ask for any more measures regulating business during his first term. The president nevertheless continued to talk of the need for federal regulation, and twice during his second term he recommended measures to Congress that would have required all firms engaged in interstate commerce to obtain a license from the federal government and would have required such firms to make annual reports of sales and profits.

Since passage of the Interstate Commerce Act of 1887 even conservatives had accepted the idea that railroads were public utilities that came within the sphere of federal regulation. But, because of judicial interpretations and executive inactivity, little control had actually been exercised. Presidential pressure and persuasion were essential if anything was to be accomplished. Without Roosevelt's sustained support it is doubtful that the Hepburn Act of 1906, which gave the Interstate Commerce Commission power to fix railroad rates and to forbid discrimination between shippers, would have been passed. The president was also instrumental in securing the passage of a Pure Food and Drugs Act (1906), which forbade the making of adulterated foods, drugs, and medicines, and a measure requiring federal inspection of meat products shipped across state boundaries.

Labour.—In 1902 Roosevelt successfully interposed federal authority in a major labour dispute. Under the leadership of John Mitchell, the anthracite coal miners' union struck for higher wages, and when the operators refused even to talk with the unions the country was faced with a coal famine with winter just a few weeks away. As real suffering visited eastern cities the president, in the name of the public, demanded arbitration. When the operators at a White House conference stubbornly refused to arbitrate or even to talk with the union leaders, the president threatened to use the Army to mine coal. Faced with this threat the owners gave way and in subsequent negotiations the miners were awarded a small increase in pay and better working conditions. Throughout the rest of his administration Roosevelt welcomed union leaders to the White House. He had no sympathy for union violence, however, and some of his actions were bitterly criticized by labour as being anti-union. Roosevelt accepted big unions as he accepted big business; on balance, he felt that unions contributed to the general welfare. He opposed the closed shop and contended that the workshop should be open to both union and non-union men without "illegal interference" from either capital or labour. At all times he believed the rights of the general public as represented by government were superior to the rights of either organized capital or organized labour.

One of the lasting achievements of Roosevelt's first term was the creation by Congress in 1903 of a Department of Commerce and Labor, with its secretary a member of the president's cabinet.

Conservation.—When asked after his retirement which of his achievements he considered most important to the national welfare, Roosevelt unhesitatingly named his conservation policies. Throughout the first century of the nation's history the government had operated under a policy of rapid and cheap disposal of public lands to private interests, the theory being that this quick exploitation of natural resources would most rapidly contribute to the nation's growth and strength. But in the latter years of the 19th century a group of conservationists led by Gifford Pinchot of Pennsylvania began to argue that this policy had led to waste and the growth of monopoly. They direfully predicted that its continuation would mean that the nation would eventually face a famine, that its forests would be depleted, and that its mineral resources would be exhausted. Responding to such arguments, Congress empowered the president to convert public lands into national forests. Under the three preceding administrations only about 40,000,000 ac. had been so treated. Within seven years Roosevelt, inspired by Pinchot and James R. Garfield, had raised that figure to 194,000,000 ac., and had included not only forests but mineral and coal lands and waterpower sites as well.

Roosevelt's conservation policy soon aroused strong opposition. Throughout the West in particular, where most of the national domain lay, it was claimed that the national development was being obstructed by a group of effete, college-educated theorists. Congress, reacting to the demands of its constituents, again and again sought to limit the presidential power to create national reserves. But Roosevelt persisted even to the point of creating forest ranger stations around valuable power and mineral sites, even though some such sites lacked trees or even brush. In 1908 he called a White House conference on conservation that focused public attention on the subject. Soon thereafter the National Conservation Commission was created to make a systematic study of the nation's resources. Perhaps none of Roosevelt's actions encountered sharper criticism or enjoyed more widespread popularity than his efforts to preserve a portion of the national wealth for future generations.

THE BETTMANN ARCHIVE, INC.
PRESIDENT THEODORE ROOSEVELT DURING HIS SECOND TERM

The president's conservation policy was finally rounded out by the Reclamation Act of 1902. Inspired by Congressman (later Senator) Francis G. Newlands of Nevada and cordially supported by the president, the act provided for setting aside almost all the receipts from public land sales in the West to pay for irrigation projects in arid regions. The program, inaugurated by the construction of the great Roosevelt Dam in Arizona, continued after Roosevelt left office and was responsible for much of the later development of the inter-mountain and Pacific coast states.

1904 Reelection.—Both Roosevelt and his policies were given a vote of confidence in the election of 1904. Seeking to divorce itself from its heritage of William Jennings Bryan and Populism, the Democratic Party nominated a conservative, Judge Alton B. Parker of New York. In a rather listless campaign the president and his running mate, Charles W. Fairbanks of Indiana, scored a smashing victory, rolling up 7,600,000 popular votes to their opponents' 5,080,000; the electoral vote was 336 to 140. Surprised and elated by the results, Roosevelt promised that he would consider his seven presidential years as constituting two full terms and that he would not seek reelection in 1908, a promise that he was later to regret.

Foreign Policy.—Something of an international social-Darwinist, Roosevelt believed that the strong and virile nations survived while the weak and placid disappeared or were conquered. He also sensed that the relatively peaceful Victorian period was giving way to an age in which naked force was likely to become the principal international arbiter. Almost every year during his two administrations he asked for larger naval appropriations, and often, to induce Congress to grant him new ships, he exaggerated the seriousness of international incidents. Through one means and another the U.S. Navy by the end of his term had been built into one of the major sea forces of the world. At the same time Roosevelt encouraged the secretary of war, Elihu Root (*q.v.*), to continue his reform of the U.S. Army. Occasionally he intervened in the established practices of both armed services to promote able young officers over the heads of their elders.

In the world power struggle, Roosevelt agreed with his two eminent secretaries of state, John Hay (*q.v.*) and Elihu Root, that Germany constituted the chief menace to the United States. Although Britain's strength was imposing, the international aims of the British were so close to those of the United States that he did not expect any serious trouble from Great Britain. Germany, Roosevelt believed, was the only nation whose international ambitions and power constituted a major threat to the United States. Both Roosevelt and Root believed that the most probable geographical point of that danger was in the Caribbean and Latin America. This attitude helps to explain Roosevelt's strong-armed intervention in Caribbean affairs and his extension of the Monroe Doctrine (*q.v.*).

Twice during the Roosevelt years the U.S. government feared German intervention in Venezuela because of the latter country's unpaid international debt, and twice the U.S. government acted with some vigour to secure a peaceful settlement that would protect Venezuela's territorial integrity. But whether Roosevelt actually threatened to use the Navy against German forces, as many years later he recalled doing, is still a moot question. In the Dominican Republic in 1903 the chaotic finances of the government threatened European intervention. What troubled the United States was that the European claims were valid and there seemed to be no way to bring about payment by the corrupt Caribbean dictators other than through the use of force. U.S. officials were quite aware that in other parts of the world the armed forces that were used to collect debts had a disturbing habit of becoming permanent guests. To solve the problem, Roosevelt and Root issued a policy statement in 1904 that in effect denied to any non-American country the right to intervene in Latin-American affairs, but also assured world creditors that the United States would police the area and become responsible for assuring that these governments would abide by their international obligations. There would be no interference, the president wrote, with Latin-American nations that kept the peace and met their international obligations. But "brutal wrongdoing, or an impotence which results in a general loosening of the ties of civilized society, may finally require intervention by some civilized nation, and in the Western Hemisphere the United States cannot ignore this duty. . . ." The so-called Roosevelt corollary to the Monroe Doctrine denied other governments the right to intervene in Latin America but sanctioned such intervention by the U.S. in the role of international policeman. Quickly applying practice to principle, Roosevelt forced the Dominican Republic in 1905 to accept the appointment of an economic adviser responsible to the U.S. Department of State.

Panama Canal.—The rapidly growing sensitivity of the United States to Latin-American affairs was in part due to the acquisition of the Panama Canal Zone in 1903 and the construction thereafter of the interocean canal. Roosevelt's part in the acquisition of the Canal Zone was spectacular. Impatient with the long-drawn-out negotiations with Colombia over the purchase of the zone, the president gave comfort and indirect encouragement to a revolutionary junta in New York led by two representatives of the old French Panama Company, Philippe Bunau-Varilla and William N. Cromwell, who planned a Panamanian revolution. The impatient president had already written a message to Congress, which was never sent, advising the taking of Panama "without any further parley with Colombia." But on Nov. 3 the planned outbreak occurred while a U.S. warship that had conveniently put

into Colón the preceding evening prevented Colombian troops from interfering. Within hours the United States recognized the new government, and in a matter of days the treaty ceding the Canal Zone was negotiated with Bunau-Varilla, who now turned up in Washington as Panama's first representative. Construction of the canal was promptly started, and in 1914 the new waterway was opened to world shipping. (*See* PANAMA CANAL.)

Ever since the settlement of the Pacific Coast, American interest in the Pacific area had been growing. With the acquisition of parts of Samoa, Hawaii, Guam, Midway, and the Philippines during the late 19th century the area became a major concern of the Washington government. The Pacific position of the United States, Roosevelt said in 1902, "is such as to insure our peaceful domination of its waters." From such a supposition Roosevelt's intervention in the peace negotiations following the Russo-Japanese War of 1904 was logical. The president's skilful diplomacy in bringing Russia and Japan together at the Portsmouth Conference won him the Nobel Peace Prize; he also attempted to construct a balance of power between Russia and Japan in the Pacific, so that neither country would be able to imperil America's fast-growing interests there. In later years Roosevelt's East Asia policy was threatened by the rise of Japanese power and by the inclusion of both Russia and Japan in the system of world-girdling alliances forming in Europe. Meanwhile the president approached a variety of very thorny problems with Japan with extreme caution. The trouble over the anti-Japanese attitude on the West Coast was settled temporarily by the Gentlemen's Agreement of 1907 (by which Japan promised not to issue passports to labourers wishing to migrate to the United States) and the tacit recognition by the United States of the Japanese seizure of Korea. But by the end of his term Roosevelt was distinctly worried about future relations with Japan. It was typical of Roosevelt that he chose to send a part of the U.S. fleet on a world cruise (December 1907–February 1909) to demonstrate the nation's naval power.

By 1907, if not before, Roosevelt was acutely aware of the danger that a major war might break out in Europe. By that time also the president, as well as most of his chief advisers, had come to the conclusion that the long-term interests of the United States lay in preserving British hegemony in the non-European world. This conclusion came in part from a realistic appraisal of the world situation and in part from the increasingly friendly state of Anglo-American relations. Great Britain had been more than friendly to the United States during the Spanish-American War and had been generous in the Hay-Pauncefote treaties that cleared the way for the United States to dig the Panama Canal. In the controversy with Canada over the Alaskan-Canadian border the vote of the British representative on the arbitration commission had favoured the U.S. position on most vital issues. Against this background Roosevelt projected the United States into the 1906 Algeciras Conference (*q.v.*), which was called to prevent the outbreak of a European war over Morocco. The president had, in fact, been at the centre of the delicate negotiations that preceded the calling of the conference. The U.S. representative at the Algeciras meeting was instructed to do nothing that would imperil the existing Franco-British understanding, the continuation of which, the Department of State felt, was favourable "for the peace of the world and, therefore, the best interests of the United States. . . ." Roosevelt's European policy modified the long tradition of U.S. isolation and cemented further the rapidly growing British-American friendship that was to become so important in world politics during the next 50 years.

Last Years as President.—Roosevelt's last years as president were anything but calm. From the early days of his administration, when he invited the Negro leader and educator Booker T. Washington to lunch at the White House, he seemed to court personal controversy. He continued to preach and practise "the strenuous life." His crusade against "race suicide" (occasioned by his alarm at the falling birthrate), his public quarrels with popular naturalists, and his order to the government printers to use a system of simplified spelling all developed into national arguments. After the financial panic of 1907, which businessmen and conservatives attributed to Roosevelt's attacks on large industry and finance, these controversies became more serious in tone. The president's rather high-handed disciplining of a Negro regiment for its part in a riot at Brownsville, Tex., and his quarrel with Congress over increased appropriations for the Secret Service—during which he implied that the opposing congressmen might have something to hide—led to a bitter controversy. But most of the opposition to Roosevelt came from a growing conflict between the conservatives and the progressives within the Republican Party. During his last two years Roosevelt veered sharply to the left in his social and economic thinking, a direction which a good many western and reform-minded Republicans enthusiastically adopted. By 1908 a small but vigorous minority of his party was already in opposition to the leadership of Nelson W. Aldrich in the Senate and Joseph G. Cannon in the House. Roosevelt sided with the progressives against the Old Guard, and by the time of his retirement the party was so split that future trouble was inevitable.

A good part of the reason for the president's inclination toward reform came from his belief that the country was rapidly heading in a radical direction and that the party was due for defeat if it did not move in the same direction. He even felt that unless his successor broadened the policies he had enunciated during his two terms the country might swing toward socialism. Consequently, during his last years he carefully evaluated his chief lieutenants and eventually settled on William Howard Taft as a worthy successor. Taft had loyally and ably served the administration in a variety of tasks, and, next to Elihu Root, whom Roosevelt considered to be too closely tied to Wall Street, was his most trusted adviser. Late in 1907 Roosevelt let it be known that he considered Taft to be the man for the presidency, and for the next year he concentrated his efforts on securing Taft's nomination and election. Thus, when he left office in March 1909, both he and the country were confident that while the pilot was changed the course was to remain the same.

THE LATER YEARS

After leaving the White House, Roosevelt took a ten-month hunting trip through central and northern Africa. Roosevelt was an ardent amateur naturalist; the extent of his interest in wildlife can be measured by the 80-page typewritten letter he wrote to Sir Edward Grey on the birds of England that he saw while on a walking tour. After coming out of the African jungle, Roosevelt made a grand tour of Europe during which he visited the crowned heads and chief ministers of most of the major powers.

Return to Politics.—During his stay in Europe Roosevelt received many letters from home that kept him informed of the growing schism in the Republican Party. Soon after returning to New York, where he received a tumultuous welcome on June 18, 1910, he plunged into politics. By that time Taft, while trying to carry out Roosevelt's policies, had allied himself with the party's conservative leadership. The progressives, who included a number of Roosevelt's very close personal and political friends, were in outright rebellion against Taft and the conservatives. The immediate occasion for Roosevelt's reentrance into politics was a struggle between Gov. Charles Evans Hughes and the machine politicians of New York. Roosevelt tried to help Hughes and was defeated in part because of Hughes' own withdrawal from the battle and in part because of President Taft's wavering support. Elsewhere in the country the former president attempted to bring the two wings of the party together by making a speaking tour in

which he supported both the regulars and the progressives. During the western part of this tour he delivered his most famous political address on the subject of "The New Nationalism." The central doctrines of the speech departed radically from traditional Republican theory; they called for a great increase of federal power for the purpose of regulating interstate industry more closely, and a sweeping program of social reform designed to put human rights above the rights of property. Attacking the courts as well as the reactionary politicians, both of whom had been instrumental in blocking such reforms in the past, Roosevelt concluded that the community, acting through the federal government, should have the power to regulate property "to whatever degree the public welfare may require. . . ." Despite all of his efforts, Roosevelt was not able to pacify the quarreling factions of the party nor to save it from defeat in the congressional elections of 1910. For the first time in 16 years the Democrats gained control of the House of Representatives and looked forward with growing confidence to the presidential election of 1912.

After the 1910 defeat the Republican progressives organized to nominate Robert M. LaFollette of Wisconsin in 1912, but their heart was really with Roosevelt. As a result, increasing pressure was brought upon the former president to run again. Since March 4, 1909, the once glowing friendship between Taft and Roosevelt had steadily cooled, and in October 1910, when the Taft administration brought an antitrust suit against the United States Steel Corporation for a merger which Roosevelt had tacitly approved, the former president was enraged. Soon Roosevelt intimated to friends that he would run, and, roughly shoving LaFollette aside, he formally entered into a contest for delegates against the man he had placed in office. One of the bitterest campaigns for nomination in the country's history followed.

Progressive Party of 1912.—The contest for the Republican nomination was not settled until the Chicago convention in June 1912. Roosevelt had won most of the delegates selected by direct primaries but Taft had control of the Republican machine, and in the first contest over the choice of the officers of the convention it was evident that the machine was determined to nominate Taft. During the course of the stormy convention Taft was nominated and most of the Roosevelt delegates withdrew and, with Roosevelt's approval, formed the Progressive Party (*q.v.*). On Aug. 7, 1912, the Progressives met in convention and nominated Roosevelt for president and Gov. Hiram Johnson of California for vice-president. The program of the party fully incorporated Roosevelt's "New Nationalism." After Roosevelt remarked to a reporter who had inquired about his health that he felt "like a bull moose," the party came to be known popularly as the Bull Moose Party. Roosevelt waged a vigorous campaign, during the course of which he was shot by an insane man in Milwaukee while on his way to make a speech. He went ahead with his address, telling the crowd that he had a bullet in his body but assuring them that, "It takes more than that to kill a Bull Moose." In spite of Roosevelt's efforts, the Democrats, united under Woodrow Wilson, were victorious over their divided opponents. Roosevelt's only solace was in beating Taft. The popular vote stood 6,293,454 for Wilson, 4,119,538 for Roosevelt, 3,484,980 for Taft; in the electoral vote, Wilson received 435, Roosevelt 88, Taft 8.

World War I Era.—For the two years following the 1912 defeat Roosevelt rarely appeared before the public. He was involved in a lively libel suit against a Michigan editor in May 1913; he won the suit and during the following autumn led an expedition into the Brazilian jungle, where he contracted a fever and almost died. By the congressional elections of 1914 the Progressive Party was almost swept into oblivion, and Roosevelt pessimistically believed that his days as a public figure were over. But the outbreak of World War I in August 1914 provided issues on which Roosevelt again made the nation's headlines. When Germany invaded Belgium, Roosevelt wrote that the United States "had not the smallest responsibility" for the plight of that unhappy country. But within a few weeks he became an ardent champion of the Franco-British cause, and after the sinking of the "Lusitania" in May 1915 he was talking about the "unforgivable treachery" of Germany.

Roosevelt had already criticized Wilson's policy toward Mexico as being born of a "mollycoddle spirit." For the president's crusade for a neutral attitude toward the war in Europe he had nothing but imperious scorn. Through numerous speeches and the monthly issues of the *Metropolitan Magazine* he advocated military preparedness and a positive policy of aid to the Allies that would unquestionably have led to war with Germany at an early date. Toward people who disagreed with him, Roosevelt showed his old spirit of impatience. He attacked the pacifists and the "peace at any price men" as more destructive of the national welfare than "all the crooks in business and politics combined." Citizens of German origin (German-Americans) who were opposed to entering the war were labeled "hyphenates." But his sharpest attacks were on Wilson whom, by January 1916, he was accusing of "dishonorable conduct."

During the elections of 1916 Roosevelt had one overriding aim, the defeat of Woodrow Wilson. He would have liked the Republican nomination himself and actually contrived to obtain it by killing off his own Progressive Party, much to the chagrin of many of his reforming followers. When Charles Evans Hughes was made the Republican nominee Roosevelt actively supported him and campaigned vigorously throughout the eastern states on his behalf. In the very close election of 1916 the Republican Party was defeated, and once more Roosevelt felt that his days of public usefulness were over. When the nation declared war on Germany in 1917, however, Roosevelt immediately attempted to raise a volunteer division of infantry and cavalry, which he hoped to lead to France. The most he could do for his country, he wrote, was to die in a "reasonably honorable fashion at the head of my division." Once again his cherished hopes were to be bitterly disappointed. On the advice of Gen. John J. Pershing, who had been selected to lead the American Expeditionary Force, the administration refused to accept his offer. Roosevelt spent the rest of the war speaking and writing in a patriotic vein and occasionally indulging in Republican politics with wistful hopes for the 1920 election. Although he had long supported the idea of some sort of international organization to keep the peace, he was vigorous in his criticism of Woodrow Wilson's League of Nations. Had he lived, he would undoubtedly have been one of the leaders of the fight against the Treaty of Versailles and the League. By 1919 the years of inordinate activity had taken their toll. The fever Roosevelt had caught in Brazil returned in 1918, and twice during that year he was hospitalized. Meanwhile the death of his son Quentin on the field of battle in France had sapped his spirit. Early in 1919 he was still trying to convince his friends that the Republican Party would nominate him in 1920. Suddenly, and without warning, he died in his sleep on Jan. 6, 1919.

Publications.—Roosevelt wrote over 2,000 published works, including magazine articles and a profusion of books on history, politics, travel, and natural history. In addition, his letters, to be found in the Library of Congress (with copies at Harvard University), number over 150,000. They are among the most readable of all presidential letters. Roosevelt was interested in almost every facet of American life, and his correspondence is brim full of comments and allusions ranging far beyond politics. The two best collections of his works are the Memorial edition, 24 vol. (1923–26), and the National edition, 20 vol. (1926). Over 6,000 of the more important of his personal letters appear in Elting E. Morison (ed.), *The Letters of Theodore Roosevelt*, 8 vol. (1951–53).

Among Roosevelt's more important works on politics are: *New Nationalism* (1910); *Progressive Principles* (1913); and *America and the World War* (1915). His historical studies include *The Winning of the West*, 4 vol. (1889–96); *The Naval War of 1812* (1882); and *Life of Oliver Cromwell* (1900). The most widely read of his many books on natural history is *African Game Trails* (1910). *History as Literature* (1913) affords another view of this many-sided man, and *Theodore Roosevelt's Letters to His Children* reveals a tender love for and preoccupation with his offspring.

Mowry, *Theodore Roosevelt and the Progressive Movement* (1946) and *The Era of Theodore Roosevelt* (1958); Carleton Putnam, *Theodore Roosevelt: a Biography, The Formative Years, 1858–1886* (1958); Howard K. Beale, *Theodore Roosevelt and the Rise of America to World Power* (1956). Among the still useful older works are J. B. Bishop, *Theodore Roosevelt and His Time Shown in His Own Letters* (1920); William R. Thayer, *Theodore Roosevelt* (1919); and Lawrence F. Abbott, *Impressions of Theodore Roosevelt* (1920). (G. E. Mo.)

ROOT, ELIHU (1845–1937), U.S. lawyer, political leader, diplomatist, and cabinet member who developed important government policies in the areas of colonial administration, organization of the armed forces, Latin-American relations, and the conduct of diplomacy, was born Feb. 15, 1845, in Clinton, N.Y. In 1864 he graduated from Hamilton College where his father was professor of mathematics. Receiving a law degree from the New York University Law School in 1867, he was admitted to the bar and formed a law firm with John H. Strahan. Root's practice was mainly concerned with banking, railroads, wills, estates, and cases involving municipal government. He generally represented large corporate interests and was drawn into close contact with conservative Republicans but was nevertheless associated with the reform element of the party. Following 1886 he developed a close friendship with Theodore Roosevelt and served him as legal adviser during Roosevelt's mayoralty and during his term as police commissioner of New York City. As governor of the state, Roosevelt continued to draw ideas from Root, especially on trusts and franchise taxes. In 1894, and again in 1915, Root served prominently in conventions that revised the New York state constitution.

Root accepted the post of secretary of war in President McKinley's cabinet in 1899 largely because of his interest in working out governmental arrangements for the former Spanish areas, a task which fell under the War Department. His recommendation of lower tariffs to aid Puerto Rico, combined with his apprehension that a centralized government would be necessary to forestall local anarchy, resulted in passage of the Foraker Act of 1900 to provide for civil government in Puerto Rico. His selection of Gen. Leonard Wood (*q.v.*) as military governor of Cuba led to a model regime of physical, medical, and educational progress for that island. At the same time, Root insisted that the Cubans safeguard U.S. interests and incorporate the Platt Amendment (*q.v.*) in their new constitution.

In the Philippines, Root was confronted with Aguinaldo's revolt and a demoralized American Army. He succeeded in tripling the size of the latter and within two years had established U.S. authority in the islands. He then wrote the instructions for an American governing commission that was sent to the Philippines in 1900 under William Howard Taft. These instructions were, in reality, a constitution, a judicial code, and a system of laws; they were reaffirmed by Congress in the Organic Act of 1902. With their emphasis upon individual liberties and the development of local institutions, they were, both in form and substance, a model for colonial administration.

Root's accomplishments in military reform were outstanding. Taking office at a time when entrenched bureaucracy and lack of planning crippled efficiency, he persuaded Congress to transform the state National Guards into the organized militia of the U.S., established the principle of rotation from staff to line, and created the Army War College. He also introduced the principle of a general staff.

Leaving the cabinet in 1903, Root returned again as secretary of state in 1905 under Theodore Roosevelt and remained until 1909. He made a tour of South America in 1906 that was notable for arousing hitherto absent goodwill. He persuaded Latin-American states to participate in the Second Hague Peace Conference and cooperated with Mexico in mediating troubles in Central America. The "dollar diplomacy" approach was refreshingly absent in all such contacts. He allayed Japanese antagonisms raised by San Francisco school segregationists in the crisis of 1907 and negotiated the Gentlemen's Agreement by which Japan undertook to control emigration to the United States. The Root-Takahira agreement of 1908 further reestablished understanding between the two nations, although it was later criticized as conceding too much to Japanese expansionists. Root also concluded treaties of arbitration with most European nations. Later, as chief counsel for the U.S. before The Hague Tribunal, he settled the extended controversy over the North Atlantic coast fisheries with the British. Canadian relations also improved under his tactful leadership. For his contribution to peace and general world harmony, he was awarded the Nobel Peace Prize in 1912.

Root's administration of the Department of State saw important progress in taking the consular service out of politics and establishing it as a career service on a merit basis. More important, he produced a new realistic view toward diplomacy based on a frank acknowledgment that isolation could no longer be the cornerstone of American foreign policy, a view which he later sought to implement through his work on the Permanent Court of Arbitration and as president of the Carnegie Endowment for International Peace.

From 1909 to 1915, as a Republican senator from New York, Root sided with the Taft wing of the party, presiding over the national convention of 1912 that nominated Taft. After the Democratic victory in the election, he rejected President Wilson and his program, opposing the Underwood Tariff (largely because of its income tax provisions), the Federal Reserve Act, the Federal Trade Commission Act, and the Clayton Anti-Trust Act. He also opposed Wilson's neutrality policy but supported him as wartime leader; he served as head of a futile mission to Russia in 1917 for the purpose of encouraging the faltering Kerenski government to carry on the war. In the postwar fight over the League of Nations, Root was a leading Republican supporter of that organization, advocating that the treaty be accepted with minor reservations. He supported Harding in 1920, urging his election as the best path to entering the League with appropriate safeguards, and later accepted appointment to the League's commission of jurists, which framed the statute for the Permanent Court of International Justice (1920–21).

Root was appointed by President Harding as one of four U.S. delegates to the International Conference on the Limitation of Armaments that met at Washington in November 1921. He sponsored a treaty to govern the operation of submarines in future wars and the curtailment of noxious gases in warfare, and had a hand in drafting the Nine-Power Treaty on China, reiterating the Open Door Policy and guaranteeing its independence and territorial integrity. (*See* WASHINGTON, TREATIES OF.) In 1929 he accepted appointment as a member of the commission to revise the World Court statute, taking the occasion to devise a formula to facilitate U.S. entry. The commission's report, although accepted by the League Council, was later rejected by the U.S. Senate.

Throughout his last years Root was active in matters affecting the bar and continued his work with various Carnegie benefactions both in the area of peace programs and in advancement of pure science. He died Feb. 7, 1937, in New York City.

ROOT, JOHN WELLBORN (1850–1891), a pioneer in the "Chicago School" of modern architecture, was born in Lumpkin, Ga., on Jan. 10, 1850. His early schooling was interrupted when Union troops captured the town during the Civil War in 1864, and Root was sent to Liverpool, Eng., with a business associate of his father and placed in a school at Claremont. On his return to the United States in 1866 after a year at Oxford he entered New York University, graduating in 1869 with a degree in civil engineering.

Root began his professional career in Chicago as a draftsman in the firm of Carter, Drake, and Wight. There he met Daniel H. Burnham (*q.v.*), with whom he formed a partnership in 1873. At first they suffered financial reverses but the partnership was a creative one and it eventually prospered. Their first commissions were mainly residences. In 1880 they began a productive decade of commercial work distinguished by three extremely influential buildings, the Montauk (1882), the Rookery (1884–86), and the Monadnock (1889–91), all in Chicago. The last marked a decisive break with traditional styles of architecture, relying on pure functional and geometric form for its aesthetic character. Root served on the architectural staff of the World's Columbian Exposition (1893) and wrote many papers on the philosophy of the new architectural movement in Chicago. His prolific genius was cut short by death from pneumonia on Jan. 15, 1891.

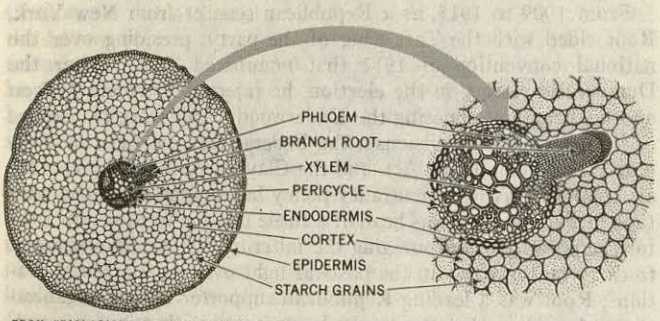
ROOT, in popular usage, is that part of a plant normally underground. Botanically, its application is more restricted, for many plants develop subterranean structures that are in reality specialized stems (corms, tubers, rhizomes; *see* STEM). The root is distinguished from such underground stems by lacking leaf scars



FROM "BIOLOGICAL SCIENCE: AN INQUIRY INTO LIFE" BY PERMISSION OF THE BIOLOGICAL SCIENCES CURRICULUM STUDY

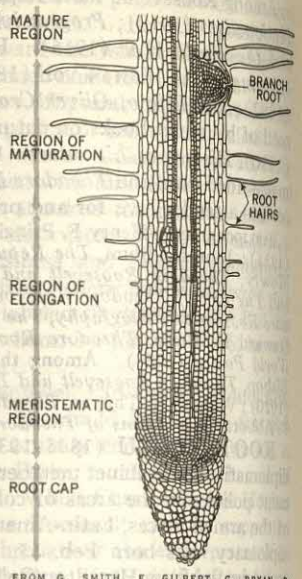
ENLARGED CROSS SECTION OF A BUTTERCUP ROOT, WITH THE VASCULAR CORE AND A YOUNG BRANCH ROOT FURTHER ENLARGED AT THE RIGHT

and buds and by having its growing tip protected by a root cap. The root functions primarily as an absorptive and anchoring organ. Root branches originate irregularly along the root axis and are produced by internal tissue (pericycle and cambium), unlike stem branches, which arise from buds. The vascular tissue (xylem and phloem) is contained within a central cylinder, not in peripheral bundles or bands as in the stem. For details on root and stem structure *see* PLANTS AND PLANT SCIENCE: *Anatomy of Plants*.

Occurrence.—Not all plants have true roots; they are lacking in algae, fungi, mosses, and liverworts, although some of these lower plants develop organs (rhizoids) that perform some of the functions of roots. Phylogenetically, the root is associated with the evolution of the sporophytic generation in the higher land plants. True roots occur only in ferns and seed plants.

Parasitic plants as the mistletoe, broomrape, dodder, and *Rafflesia,* send rootlike processes (haustoria) into the body of the host plant. In the coralroot orchid (*Corallorhiza*) a stem structure, the shortly branched underground rhizome, performs all the functions of a true root, which is absent. In some aquatic plants, the root acts merely as an anchor, or it may be flattened and contain chloroplasts for the manufacture of food; in others it is altogether absent, as in the free-floating aquatic fern *Salvinia* and in the bladderworts. The epiphyte Spanish moss is rootless.

General Features.—The primary function of the root is absorption of water and inorganic salts in solution and the conduction of these to the stem, but it also affords anchorage and support and frequently serves for storage of reserve foods. In some instances it may function in vegetative (asexual) reproduction and in special cases (some aerial and aquatic roots) may carry on photosynthesis—a function usually carried out in the leaves. The root usually develops root hairs, slender unicellular outgrowths formed by the lateral extension of cells of the outer layer (epidermis). These serve to increase the absorbing surface of the root and bring it into intimate relationship with the soil particles. The older root hairs generally die—rarely some are persistent—so that the active zone of root hairs usually lies just back of the apex of the root.



FROM G. SMITH, E. GILBERT, G. BRYAN, R. EVANS, J. STAUFFER, "A TEXTBOOK OF GENERAL BOTANY"; REPRODUCED BY PERMISSION OF THE MACMILLAN CO.

LENGTHWISE SECTION OF APICAL PORTION OF A ROOT

When the seed germinates, the primary root or radicle is the first organ to appear. It grows downward through the soil, anchoring the seedling and establishing contact with the soil. Secondary roots, which often repeat the form and structure of the main root, are developed in regular succession from above downward (acropetal), and because they originate in a definite position in the interior of the root (generally opposite the xylem masses) they develop in longitudinal rows and must penetrate the overlying tissue of the parent root. True forking (dichotomy) occurs in the Lycopsida (club mosses and allies) but not in higher plants.

Types of Roots.—In addition to the main root and its acropetal outgrowths are adventitious roots, which may arise on any part of a plant. They are especially numerous on underground stems, such as the underside of rhizomes, and also develop from stems under favourable conditions such as moisture and absence of light; a young shoot or a cutting placed in moist soil may quickly form adventitious roots. This ability of many plants to develop adventitious roots from stems is widely used in horticulture as a means of vegetative propagation to ensure the production of plants that resemble the parent stock. It is also a rapid method of propagation in the case of slow-growing woody plants. Adventitious roots may also arise from leaves under similar conditions—for instance, from begonia or African violet leaves planted on the surface of the soil.

The form of a root depends on its shape and mode of branching. When the central axis goes deep into the ground in a tapering manner without dividing, a taproot is produced. This kind of root is sometimes short and becomes swollen by storage of foodstuffs, as in the conical root of carrot, the fusiform or spindle-shaped root of radish or the napiform root of turnip. In some forest trees the first root protruded continues to elongate and forms a long primary root axis from which secondary axes arise. In many plants, especially monocotyledons, the primary axis soon dies and the secondary axes take its place. When the descending axis is very short, and at once divides into thin, nearly equal fibrils, the root is called fibrous, as in many grasses; when the fibrils are thick and succulent, the root is fasciculated, as in the sweet potato and dahlia. Some so-called roots are formed of a stem and root combined, as in *Orchis,* where the tuber consists of a fleshy, swollen root bearing at the apex a stem-bud. As in the stem, growth in length occurs only for a short distance behind the apex, but in long-lived roots increase in diameter occurs continually in a

similar manner to growth in thickness in the stem.

Roots are not invariably underground. In some cases where they arise from the stem they pass for some distance through the air before reaching the soil. Such roots are called aerial. They are seen well in corn (maize), screw pine, and banyan, where they eventually assist in supporting the stem and branches. In the mangrove they often form the entire support of the stem, which has decayed at its lower part. In tree ferns they form a dense coating around and completely conceal the stem; such is also the case in some palms.

In epiphytes, or plants growing in the air, attached to the trunks of trees, such as orchids of warm climates, the aerial roots produced do not reach the soil; they continue aerial and greenish and they possess stomata. Delicate hairs are often seen on these epiphytic roots, as well as a peculiar spongy investment formed by the cells of the epidermis that have lost their succulent contents and are filled with air. This layer, the velamen, serves to absorb the moisture contained in the air, on which the plant is partially dependent for its water supply. Some leafless epiphytic orchids, such as species of *Angraecum,* depend entirely upon their aerial roots for nourishment; these perform the functions of both leaves and roots. A respiratory or aerating function is performed by roots of bald cypress and certain mangroves growing in swampy soil or water and sending up pneumatophores, vertical roots provided with aerating passages.

ROOT. Arab writers of the 9th century spoke of one of the equal factors of a number as a root, and their medieval translators used the Latin *radix* ("root") for the same concept. The adjective is "radical."

If a is a positive real number and n is a positive integer, there exists a unique positive real number x such that $x^n = a$. This number is called the (principal) nth root of a, and is written $\sqrt[n]{a}$. The integer n is called the index of the root. For $n = 2$, the root is called the square root and is written $\sqrt{a}$. The root $\sqrt[3]{a}$ is called the cube root of a. If a is negative and n is odd, the unique negative nth root of a is termed principal.

The practical determination of square and higher roots of positive numbers is discussed in the article on ARITHMETIC.

If a specific integer (whole number) has a rational nth root, *i.e.*, one which can be written as a common fraction, then this root must be an integer. Thus 5 has no rational square root since $2^2 < 5$ while $3^2 > 5$.

There are exactly n complex numbers which satisfy the equation $x^n = 1$, called the complex nth roots of unity. If a regular polygon of n sides is inscribed in a unit circle with centre at the origin so that one vertex lies on the positive half of the x-axis, the radii to the vertices are the vectors representing the n complex nth roots of unity. If the root whose vector makes the smallest positive angle with the positive direction of the x-axis is denoted by ω, then $\omega, \omega^2, \omega^3, \ldots \omega^n = 1$ constitute all of the nth roots of unity. Thus $\omega = -\frac{1}{2} + \frac{1}{2}\sqrt{-3}$, $\omega^2 = -\frac{1}{2} - \frac{1}{2}\sqrt{-3}$, $\omega^3 = 1$ are the cube roots of unity.

Any root ϵ which has the property that $\epsilon, \epsilon^2, \ldots \epsilon^n = 1$ give all of the nth roots of unity is called primitive.

Evidently the problem of finding the nth roots of unity is equivalent to the problem of inscribing a regular polygon of n sides in a circle. For every integer n, the nth roots of unity can be determined in terms of the rational numbers by means of rational operations and radicals; but they can be constructed by ruler and compasses (*i.e.*, determined in terms of the rational operations and square roots) only if n is a product of distinct prime numbers of the form $2^h + 1$, or 2^k times such a product, or is of the form 2^k.

If a is a complex number not 0, the equation $x^n = a$ has exactly n roots. (*See* COMPLEX NUMBERS.) All of the nth roots of a are the products of any one of these roots by the nth roots of unity.

The term root has been carried over from the equation $x^n = a$ to all polynomial equations. Thus a solution of the equation

$$f(x) = a_0x^n + a_1x^{n-1} + \ldots + a_{n-1}x + a_n = 0,\ a_0 \neq 0$$

is called a root of the equation. If the coefficients lie in the complex field, an equation of the nth degree has exactly n not necessarily distinct complex roots. If the coefficients are real and n is odd, there is a real root. But an equation does not always have a root in its coefficient field. Thus $x^2 - 5 = 0$ has no rational root (*see* FIELDS; POLYNOMIAL).

If $f(x) = 0$ is an equation with coefficients in a field F, there exists a unique field F^* obtained by adjoining to F all of the roots of $f(x) = 0$. This field is called the root field of $f(x) = 0$. In F^* the polynomial $f(x)$ can be factored into linear factors. (*See* EQUATIONS, THEORY OF.)

A rigorous proof of the existence of the root field F^* can be made along the following lines. Let $f_1(x)$ be a factor of $f(x)$ which is irreducible in F. The set of all polynomials in x with coefficients in F, taken modulo $f_1(x)$, constitutes a field F' containing F in which $f_1(x)$ has a linear factor. A continuation of this process leads to the root field F^*.

ROPE. Rope is made of natural or man-made fibres and of metallic wires. Only fibre rope will be discussed in this article. For a discussion of wire rope *see* WIRE: *Wire Rope.*

"Cordage" is a term applied generally to ropes, yarns, cords, twines and cables. Fibre rope is cordage of stranded construction, *i.e.*, fibres are laid parallel and twisted together to make a yarn; two or more of these yarns are then twisted together, forming the strand; and three or more of these strands are next twisted together, laying the rope. Three or more ropes laid together make a cable-laid rope, sometimes referred to as hawser-laid. The smallest fibre ropes are approximately $\frac{1}{2}$ in. in circumference, or $\frac{3}{16}$ in. in diameter; similar products of smaller dimensions are not rope in the usual sense of the word.

Two or more yarns twisted together are twine; certain types of twine are sometimes referred to as cord. Single yarns are known as yarns, with the exception of binder twine, which is a single-yarn product. Braided yarns, such as sash cords, are sometimes referred to as rope. (X.)

Early History of Ropemaking.—Rope is already represented in use in southwest Asia (Elam) in the chalcolithic period (4th millennium B.C.), but this was probably made of plaited thongs, a type that has persisted down to modern times in some cultures. Probably almost, if not quite, as ancient is rope made of bark fibre, represented in more evolved forms by the coir (*q.v.*) types of southeast Asia; the most primitive coir technique consists of rolling the fibres together with the palm of the hand on the bare thigh.

Cord must have been used very early, probably in the Upper Paleolithic period at least, to attach tools to handles; and the same need for rope implies its common currency in the 4th millennium, when numerous bone handles are sometimes found with the blade or point missing. In the middle of the 3rd millennium

B.C., patterns impressed with spun cords are the definitive feature of a southeastern European pottery; and by the middle of the 2nd millennium heavy rope must have been a commonplace in the east Mediterranean, given the development there of shipping and hence ships, which even when propelled by oars require rope equipment. Moreover, at about this same time a number of terms for "rope" are found in Akkadian; examples of papyrus rope of about this period have been found in Egyptian tombs. Late in the millennium heavy cables are reproduced in bronze as handles of vessels in China, where the technique had probably been conveyed by the bronze casters, most likely from the eastern Asia Minor-Adharbayjan region, and heavy cable moldings appear about the same time on pottery from Luristan, whose bronze art can be traced to the same source.

When Xerxes (480 B.C.) built the bridge of boats across the Hellespont the Phoenicians constructed one line with cables of white flax and the Egyptians in the other line used ropes made of papyrus. In India in the 4th century B.C. ropemaking was so specialized that one class of experts made ropes just for horses, another for elephants; and in China, in the Han period if not earlier, the emperor's carriage in time of mourning was equipped with silk ropes. The craft was carried, along with various textile and other techniques such as pottery making and metallurgy, into the early American cultures. (P. AN.)

Ropemaking had been going on for centuries with little change up to the time of the introduction of machinery about the middle of the 19th century. In the early days all the yarn was spun by hand. The hemp, which was the most widely used ropemaking material at that time, was first hackled by combing it straight over a board studded with sharp steel teeth. A bunch, or head, of this hackled hemp was placed around the waist of the spinner, who attached a few fibres to a hook on a spinning wheel and, as the hook was revolved by hand, walked backward away from the wheel, feeding the fibre from the supply around his waist while preserving the uniformity and proper size of the yarn. Several yarns were then twisted together by use of a hand wheel and several hooks to form the strand; and three or more strands were next twisted together to lay the rope.

The term "ropewalk" came from the long low buildings used and the walking back and forth of the spinners and ropemakers. In the early days every community of any size, especially the seaports, had its ropewalk. These walks were often 900 ft. or more in length and many were in the open air. The crude methods of ropemaking of centuries ago are still used in some parts of the world.

Raw Materials.—In the United States and Europe soft fibres, principally hemp and flax (*qq.v.*), were used for rope until the second quarter of the 19th century. Hemp is still used for tarred hemp rope and fittings for marine purposes and flax is used for making twine and other light cordage. Abacá fibre (*q.v.*), commonly referred to as Manila hemp because it was once grown commercially almost exclusively in the Philippine Islands and was exported principally from the port of Manila, has established itself as the best material for ropemaking where strength and durability are the prime requirements. Henequen (*see* AGAVE), next in importance as a rope fibre, comes from Yucatan and Cuba. Sisals also are important rope fibres; they come principally from east Africa, Indonesia and Haiti (*see* SISAL FIBRE). Jute and cotton are used to a limited extent in the manufacture of ropes of stranded construction. Cotton is used to a greater extent in the manufacture of braided cords. (*See* also FIBRE.)

(J. S. McD.)

The introduction of man-made fibres exerted great changes in the use, life and care of rope. Nylon, Dacron, glass, saran, polyethylene and polypropylene ropes came into commercial use during and after World War II. The basic advantages of such fibres over natural fibres are higher strength and immunity to deterioration (rot, mildew, abrasion, etc.) on both land and sea. This latter characteristic eliminates the need for the protective treatments commonly used on ropes made of natural fibre. Their greater strength permits the use of smaller ropes within reasonable limits, thus providing greater ease of handling.

The life of a rope made of man-made fibre is generally estimated to be three or four times that of the natural-fibre rope, although the different types of man-made fibres display differing qualities, including those of elasticity, heat resistance, wear resistance, dielectric properties and resistance to light. Outstanding qualities in these properties led to new applications for rope as well as the substitution of synthetic ropes for natural-fibre ropes.

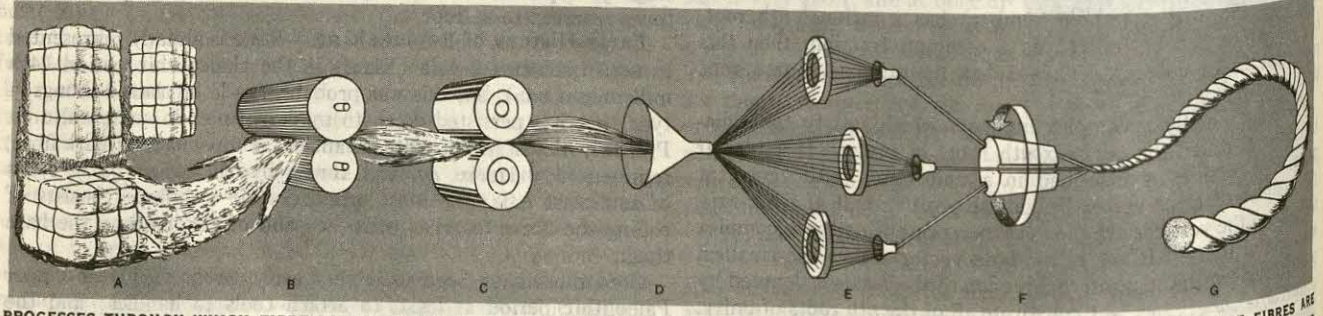
(W. A. Sc.)

Manufacturing Processes.—The primary object of twisting fibres together in a rope is to arrange them so that they will be held together by friction when a strain is applied to the whole. Hard twisting (*i.e.*, arranging a relatively high number of twists per unit length) has the further advantage of compacting the fibres and preventing, to some extent, the penetration of moisture when the ropes are exposed to water; but the yield of rope from a given length of yarn diminishes in proportion to the increase of twist.

The ropemaking process is essentially the same, no matter what kind of fibre is used. The process divides itself into five operations. First, selection of fibre; second, preparing the sliver; third, spinning the yarn; fourth, forming the strands; fifth, laying the strands into rope. With cable-laid ropes there is another operation, *i.e.*, laying the strands, which are in fact completed ropes, into the finished cable.

At the start of the manufacturing process using natural fibres, the bales of fibre are opened and the bundles of fibre are shaken out. The fibre is put through several processes of combing and straightening. These operations are, in general, all of the same kind. The fibre is carried along slowly on a series of bars connected by endless chains, the bars being studded in the manner of a comb with sharp steel pins that stand upright as the fibre passes along with them. A similar set of combs, moving very much faster, pulls the fibre rapidly away from the first set, combing it out at the same time. A lubricant is sprayed on the fibre as it enters the first machine.

The fibre is delivered from the machine in a heavy, continuous stream, or sliver, that is coiled by hand or machine into a receptacle, or on the floor. Several of these slivers are then fed into a similar machine, and the kinks and unevenness are further removed by a repetition of the same process. This preparation,



PROCESSES THROUGH WHICH FIBRE PASSES IN THE MANUFACTURE OF ROPE: TANGLES ARE SHAKEN OUT OF THE RAW FIBRES (A) AND THE FIBRES ARE LUBRICATED (B). AFTER SEVERAL COMBINGS THE FIBRES ARE COMPRESSED INTO SLIVER (C) AND TWISTED INTO YARN (D). FURTHER COMBINATION AND TWISTING IN THE OPPOSITE DIRECTION (E) RESULTS IN STRANDS OF ROPE WHICH CAN BE TWISTED ONCE MORE, AGAIN REVERSING THE DIRECTION OF TWIST (F) TO PRODUCE CABLE (G)

or combing, is repeated from 8 to 12 times on five different machines, each operation combing the fibre and producing a smaller and more even sliver until finally it comes out of the finisher in a continuous stream. The thoroughness with which these operations are carried out—the care taken in preparing the fibre—is largely responsible for the uniformity and excellence of the finished product. The object in preparing the sliver is to eliminate all dirt and foreign matter and to lay the fine, threadlike strands parallel with one another so that they can be spun together more easily.

As the sliver enters the spinning machine it is taken from the rollers by another series of fine combs. From the combs it passes through a funnel-shaped tube and is then wound about a little capstan. It is between the tube and the capstan that the yarn comes into being. The friction on the revolving capstans draws the yarn through the machine. From the capstans it is automatically wound on a large spool, or bobbin, about 12 in. long. The capstans and the bobbin whirl very fast, and the combination of this whirling motion and the drawing forward of the revolving capstans spins the heretofore parallel fibres into what is known as a yarn. For different sizes of yarn and for yarns designed for various purposes, a varying number of twists per foot are imparted to the yarn. This yarn is the first merchantable product of the cordage mill and may be sold in this form or used to make other cordage products.

A rope is usually formed of three or four strands, each strand composed of a number of yarns laid parallel and twisted together slightly. The making of these strands is called forming. As the strand is twisted it is wound on a large reel and appears as a smooth, round strand composed of a number of individual yarns. This strand is known as the ready. The yarn has a tendency to untwist; to overcome this tendency the twist of the ready is made in the opposite direction. The result is that the tendency of the yarn to untwist in one direction and the tendency of the ready to untwist in the other direction balance each other.

The ropemaking operation is called laying. In laying the rope, three or four reels containing the readies, or strands, are put on the laying machine, and the strands are led through a "block," wound around the capstan and reeled on the finishing end of the laying machine. In laying there is a different twisting problem, for the ready is neutral—that is, it has no tendency to untwist—and if the readies were twisted together without altering this neutral condition the rope would continually untwist. So an extra twist is added to the ready as it is passed into the machine, this twist being computed so that it will be just sufficient to counteract the tendency of the three strands to untwist when they are formed into a rope. Good rope is neutral; if cut in 5-ft. to 10-ft. lengths and laid on the ground, it will not untwist of its own accord.

Cable-laid rope consists of three completed ropes; *i.e.*, nine of the simple strands that form an ordinary rope. The same method of balancing the twisted strands is used, an additional twist or foreturn being given to the three-strand ropes just before they are laid so that their tendency to untwist in one direction counterbalances the tendency of the cable to untwist in the opposite direction.

Uses and Care.—The uses of rope are many and varied. The marine and fishing industries consume more than half of the rope produced. Cable-laid rope is also used extensively in the drilling of oil, water and gas wells. Ropes are used in the transmission of motive power. Rope is used for hoisting, hauling, rigging, wrapping, towing and many other purposes, and in building and engineering projects. In the home it has many applications.

The useful life of rope depends on its quality and on the care and treatment it receives. To give best service, it must be made of high-grade raw material, selected with a thorough knowledge of what the rope is to do. It must be so made that every strand will be of even tension. Natural-fibre ropes must be treated with a lubricant that will preserve as well as lubricate. Three general sources of damage can shorten the life of rope: first, mechanical injury, such as bending over too sharp a pulley; second, damage from chemicals, such as acids; and third, damage from climatic or other conditions of storage, such as moisture or dry rot. It should be stored in a cool dry place in which air is permitted to circulate.

(J. S. McD.)

There are many varieties of cord and twine. The fishing industry uses many different types for lines and nets, while the variety of cord and twine for other industrial and for household purposes is almost unlimited. All yarn from long vegetable fibre is more or less rough as it leaves the spinning frame, even after two or more threads have been twisted together. It is therefore necessary, for many uses, to impart a polish to the cord or twine. Special machines are used for this purpose. Bobbins of yarn are placed in a bank or creel, and the ends are collected and passed under a roller that is immersed in hot starch. The yarns become saturated with this starch, but, as they emerge from the starch box, the superfluous starch is removed by passing the yarns between two rollers. The yarns now pass over a series of drying cylinders and polishing rollers and are finally rewound by the same machine onto other bobbins. This machine is termed a bobbin-to-bobbin polishing machine. In some cases the hot drying cylinders are replaced by a system of hot-air drying. The finished yarns are now made up by machinery into hanks, balls or cheeses.

ROPEWAYS AND CABLEWAYS. An aerial ropeway is a special form of railway in which the traffic-carrying unit is a steel wire rope. Whereas in a railway the path for the traffic is formed by steel rails laid along the ground, a ropeway uses a tensioned wire rope supported above the ground. It can be used for the transport of both materials and passengers.

Until steel wire ropes came into use, ropeways were limited in scope by the relatively low strength of hemp or other natural fibres; and the popular impression of the origin of ropeways is based on a mid-17th-century print showing a crude form of installation in which such fibre ropes were used. It was the steel wire rope which made ropeways an important modern means of transport. They are particularly useful in regions where their facility in surmounting natural barriers gives them a great advantage over railways or roads, both of which may need heavy civil engineering work to secure easy gradients. Quite apart from this, ropeways have other advantages. They are inexpensive to maintain; their power demand is modest; and they are not seriously affected by adverse climatic conditions.

There are two main types of ropeway systems: monocable and bicable—both are described below. The choice of a particular type depends upon the length and topography of the route, the type and intensity of the traffic, and in many cases the remoteness of the site and the class of labour available for operation.

Monocable Ropeway.—This comprises an endless loop of rope which is maintained in continuous circulation by a grooved driving wheel at one end of the route, and kept under tension by a counterweighted wheel at the other end. Tension is necessary both to keep the rope clear of the ground when it is carrying traffic and to prevent it from slipping on the driving wheel. Between the two ends of the route, the outward and return legs of the rope are supported on pulleys carried on towers; these are positioned so as to ease gradients and also maintain ground clearance where the profile is irregular.

The loads are usually carried in containers spaced at regular intervals along the moving rope. The containers are slung from carrier heads provided with clips which, when the rope gradient does not exceed about 23°, merely rest saddlewise on the rope or, for steeper gradients, are arranged to grip the rope mechanically. Small wheels are mounted on the carrier heads, to allow them to be detached in the terminal stations from the moving rope and to run on to a fixed rail where they can come to rest to be loaded or unloaded. The modern practice is to mechanize the propulsion and control of the carriers on the fixed rails by means of slow-speed haulage ropes or chains. This enables angle stations (*see* below) to work automatically.

Capacities of up to 120 tons per hour can be carried on the less

steeply graded routes at a speed of about 2 yd. per second; but in favourable conditions both speed and capacity can be increased by as much as 50%. Steeper gradients are restricted to the smaller capacity installations of up to 50 tons per hour. The individual gross load on the rope seldom exceeds 1% of the hourly net capacity. For example, a monocable system with a net capacity of 100 tons per hour and a speed of 2 yd. per second would be designed with gross loads of 1 ton, the containers and carriers having a total tare weight of about $\frac{1}{4}$ ton.

Monocable ropeways with positive-acting, mechanically operated grips can work on rope gradients of up to 40°, and can run at speeds of 3 yd. per second or more. They are most commonly used for the transport of passengers, particularly in mountainous districts, since the carriers with two or four persons lend themselves to the fitting of special devices required by law to ensure safe transport of the passengers.

Bicable Ropeway.—In this system two stationary carrying ropes are employed, these being parallel to one another and held under tension above the ground, on towers suitably positioned. Spans of over 1,000 yd. can be used if conditions permit. The containers have carriers with wheels arranged to run on the two fixed ropes; a separate endless moving rope is used to haul the carriers along these fixed ropes, the moving rope being driven and tensioned as in the case of the monocable system. The carriers are provided with mechanical grips which automatically attach and detach themselves from the moving rope when the carriers are leaving from or arriving at the terminal stations. Angle stations are automatic in action unless the carrier needs to be detached for other reasons.

The terminal stations have fixed rails on which the carriers can run, these rails being structural prolongations of the fixed ropes along the route, and usually arranged to provide a connecting loop between the incoming and outgoing ropes. The propulsion of the carriers along the station rails is usually mechanized by a prolongation of the haulage rope, or by a separate slow-speed rope if the containers have to be loaded.

Bicable ropeways are used where rope gradients are considerable—up to 40°—and where capacities are high—up to 500 tons per hour, at the generally accepted speed of about 3 yd. per second. Very heavy individual loads can be carried because the carrying ropes can be increased in size without materially affecting the haulage rope. Many bicable ropeways exist with individual loads of over 5 tons net, usually for carrying logs.

Length of Ropeways.—Many long ropeways have been built, on both the monocable and bicable systems, but they all consist of a series of short, interconnected ropeways. Each section is preferably routed in a straight line of 3–6 mi. length, but the junction of two sections can be set at an angle to secure any necessary diversion of the general route. The junction stations can be arranged as intermediate loading or unloading stations, with accommodation sidings or shunts.

Two examples of long ropeways are: Kristineberg to Boliden, in Sweden, a distance of 60 mi., with a bicable ropeway handling 500,000 tons of iron ore per year; and Mariquita to Manizales, in Colombia, a distance of 47 mi., with a monocable ropeway handling 25 tons of general merchandise per hour.

Aerial Cableways.—An aerial cableway is a special form of overhead crane in which the hoisting and cross-traveling carriage runs in a single span on one or more steel wire ropes instead of on a rigid horizontal girder. The use of a single rope span with a traveling carriage goes back to Roman times, but one of the earliest recorded cableways with steel ropes was built in Scotland in 1873 for a load of 3 tons of granite. Lifting capacities grew steadily over the years: 8 tons in 1884; 10 tons in 1902; 20 tons in 1919 and 150 tons in 1932.

An aerial cableway can cover much larger areas than a rigid structure can, and installations are commonly built with spans of 1,500–3,000 ft. The carrying ropes terminate at each end of the span in structural steel towers. One of these, known as the head tower, incorporates the mechanism for tensioning the ropes, and also the driving machinery and controls both for moving the hoisting and cross-traverse carriage backward and forward over the spans, and for raising or lowering the load hook. The tail tower, at the other end of the span, provides termination and support for the ropes at the required elevation.

BRITISH ROPEWAY ENGINEERING CO., LTD.

BICABLE CARRIAGE, BUCKET AND HANGER ON AERIAL ROPEWAY

The cross-traverse motion is obtained by means of an endless loop of rope tensioned and driven by means similar to those applying to monocable ropeways, and spanning the gap between the towers just below the carrying ropes on which the carriage runs. The carriage is permanently attached to the cross-traverse rope and moves with it. The hoisting motion is obtained by a separate rope passing from a winch mechanism out over the span, and reeved through the carriage down to the load hook. The carrying ropes are sufficiently tensioned to ensure that the ratio between sag and span is not more than about 1 to 20 when the fully-loaded carriage is at the middle of the span.

In the simplest case both head and tail towers are fixed, in which case the cableway provides service along the line only; but either one or both of them can be mobile, thus covering an area which is either triangular or rectangular in shape. Their ability to cover large service areas makes cableway installations particularly useful in the construction of dams. The head and tail towers are usually situated high up on the flanks of the valley in which the dam is to be built, and their available movements are arranged so as to command beneath the load hook the whole of the construction area. The cableway then serves to remove excavated material, to place the formwork and reinforcement for the concrete, and finally to carry the concrete itself from the mixing plant to the formwork.

The largest cableway built was for the U.S. reclamation bureau, Denver, Colo., for use on the Hoover (Boulder) dam. It had a capacity of 150 tons, a span of 1,256 ft. and used six supporting ropes for the carriage to run upon.

The rope techniques evolved for ropeways and cableways have been extended to new forms of conveying; instead of the intermittent containers mentioned above, continuous systems are carried by running ropes.

(H. F. H. S.)

ROPS, FÉLICIEN (1833–1898), Belgian painter and graphic artist, who ranks as a modern master in printmaking, was born at Namur, July 10, 1833. Rops spent his childhood in Namur, later going to Brussels. In 1856 he composed for friends at the university the *Almanach crocodilien*, his first work. He brought out two *Salons illustrés* and collaborated on the *Crocodile*, a students' magazine. This attracted the attention of publishers and he designed frontispieces for P. A. Poulet-Malassis and Gay. In 1859–60 he contributed some of his finest lithographs to the satirical journal, *Uylenspiegel*. About 1860 he went to Paris and worked in the studio of H. A. Jacquemart but returned to Brussels and founded the short-lived International Society of Etchers. In 1865 he produced his famous "Buveuse d'absinthe" (Absinthe drinker) and in 1871, "Dame au Pantin." After 1874 Rops resided in Paris, devoting himself principally to illustrating books. Among his notable book illustrations are *Légendes flamandes* by C. de Coster, *Jeune France* by Théophile Gautier, *Les Diaboliques* by Barbey d'Aurevilly, *Zadig* by Voltaire and the poems of Stéphane Mallarmé. Many have frontispieces which exhibit his

fertile and powerful imagination. He published *Cent croquis pour réjouir les honnêtes gens* ("One hundred sketches to delight solid citizens"). Rops joined the Art Society of the "XX," formed at Brussels in 1884, as their revolutionary views were in harmony with the independence of his spirit. He died at Essonnes, France, on Aug. 22, 1898.

After Rops's death, the Libre Esthétique, which had succeeded the "XX," arranged a retrospective exhibition (1899) of his paintings and drawings. M. Exsteens, in his definitive catalogue of the prints of Rops, lists 1,193 subjects. It is unfortunate that these survive more for their so-called licentiousness and their free choice of subject than for any other reason, because his work as a printmaker is most important, both for its brilliance of technique and its originality of content. His handling of dry point marks him as one of the masters of the medium; he was one of the first modern etchers to revive the neglected medium of soft-ground etching and employ it to great effect. Although Rops was a friend of Charles Baudelaire, the poet, Rops's work has a spiritual counterpart in literature in the diabolical dandyism of Barbey d'Aurevilly more than in the *Fleurs du mal.*

See E. Ramiro, *Félicien Rops* (1905), the best monograph on the artist, and M. Exsteens, *L'Oeuvre gravé et lithographié de Félicien Rops,* 4 vol. (1928), a complete descriptive catalogue of all of Rops's prints with illustrations of each work. (H. Es.)

ROQUE: *see* CROQUET AND ROQUE.

RORAIMA, one of four federal territories in Brazil. Formerly a part of the state of Amazonas, it was created by decree in 1943 and until 1962 was named Rio Branco. Area 88,843 sq.mi. Pop. (1960) 29,489. Located in the northernmost part of Brazil, it is bounded on the northeast by British Guiana, on the south by Amazonas, and on the northwest and north by Venezuela. It is drained from north to south by the Rio Branco, a tributary of the Rio Negro. Much of the territory is covered with rain forest or selva, but around Boa Vista, pop. (1960) 10,180, the chief city and capital, there are extensive woodland savannas which extend across the border into British Guiana (the Rupununi savanna). Along the Venezuelan border there are high tablelands, covered partly with forest, partly with savanna. At the border of Roraima, British Guiana, and Venezuela is the plateaulike Mt. Roraima. Roraima is scantily inhabited, especially along its borders. The savannas are used for cattle ranching, and some gold and diamonds are found in the streams. (P. E. J.)

RORE, CYPRIEN (CIPRIANO) **DE** (1516–1565), Flemish composer, the most original and influential master of the Italian madrigal during the middle years of the 16th century, was born in 1516, apparently in Antwerp. He went to Italy about 1534 and studied in Venice with Adriaan Willaert. He later held posts as *maestro di cappella* at the ducal courts of Ferrara (1547–59) and Parma (1561–63) and at St. Mark's, Venice (1563–64). In 1564 he returned to Parma, where he died in the autumn of 1565.

Rore's seven collections of madrigals (1542–57), most of them for five voices, reveal a serious and uncompromising artist. He greatly expanded the scale of the madrigal by disregarding the verse forms and treating individually each line of the text; he was also the first to link several madrigals together to form a coherent cycle. His expressive chromatic experiments greatly influenced the later development of the Italian madrigal.

See A. Einstein, *The Italian Madrigal* (1949); J. Musiol, *Cyprien de Rore* (1932). (B. L. TR.)

RORSCHACH, HERMANN (1884–1922), Swiss psychiatrist, who devised the ink-blot test known by his name and widely used in diagnosis of psychopathologic conditions, was born in Zürich, Nov. 8, 1884. The test involves ten symmetrical ink blots. Earlier investigators had used ink blots as free association stimuli but had generally limited themselves to studying the thematic content. Rorschach's approach involved systematically analyzing the patient's attention to wholes or details of the blot figures, colour, and shading, apparent movement in human form percepts, and other factors. Thus he hoped to detect psychologic processes or structure of the personality and reported differential patterns for several clinical disorders. The test has been criticized by experimentalists because of serious doubts concerning its accuracy (validity) in diagnosis and prognosis. It has proved to be very popular, however, and is used in many countries. Rorschach looked on his work as experiment in perception and emphasized an empirical statistical orientation. (*See* PSYCHOLOGICAL TESTS AND MEASUREMENTS.) Rorschach died at Herisau, Switz., April 2, 1922. His best-known work is *Psychodiagnostics,* 5th ed. (1951).

ROSA, CARL AUGUST NICHOLAS (1842–1889), German violinist and impresario born in Hamburg on March 22, 1842, his family name (which he subsequently changed) being Rose. He began his career as a solo violinist, studying at Leipzig and Paris. In 1867 he married Euphrosyne Parepa (1836–74), an operatic soprano, and in 1873 he formed the Carl Rosa Opera Company for the production of opera in English. The company's activities included bringing opera to the English provinces as well as to London, and in presenting new or unfamiliar works, many by British composers. He died in Paris on April 30, 1889. (H. RU.)

ROSA, SALVATOR (1615–1673), Italian painter, etcher, poet, actor, and musician, remembered for his wild or "sublime" landscapes and his romantic personality, was born in Arenella, near Naples, either on June 20 or July 21, 1615 (contemporary sources differ). He studied in Naples, coming under the influence of Jusepe Ribera, and was for a time in the studio of the battle painter Aniello Falcone. Encouraged by G. Lanfranco, he went to Rome in 1635 to study, but contracted malaria and returned to Naples, where he painted numerous battle pictures and developed his peculiarly characteristic style of landscape—savage scenes peopled with shepherds, seamen, or, especially, soldiers—the whole being infused with a poetic or romantic quality. A painting of "Tityus Tortured by the Vulture" established his reputation in Rome, and he was already famous when he returned there in 1639.

In Rome he was rash enough to satirize Bernini during the Carnival of 1639 and made a powerful enemy. For some years thereafter Florence was more comfortable for him than Rome. In Florence he enjoyed the patronage of Cardinal Giancarlo de' Medici. His own house became the centre of a literary and artistic circle (Accademia dei Percossi), where dramas were performed and Rosa's flamboyant personality found expression in acting. In 1649 he finally settled in Rome, where he remained until his death on March 15, 1673.

In Rome Rosa, who regarded his landscape paintings more as recreation than as "high art," set up as a religious and history painter, but while this aspect of his painting now seems rather dreary and academic, the landscapes have assumed increasing significance. Their "sublime" qualities (although imposed on a compositional formula as classical as that of either Claude or Poussin) were contrasted with the serene classicism of the other two artists and were particularly influential in 18th-century England. From the very outset of the Romantic era, their pseudo-Romanticism—combined with the legend of the brilliant but erratic genius and rebel against society that had grown up around Rosa's own personality—fulfilled the 19th-century ideal of what a romantic artist should be. In 1660 Rosa began etching and completed a number of successful plates. His satires were printed in 1710.

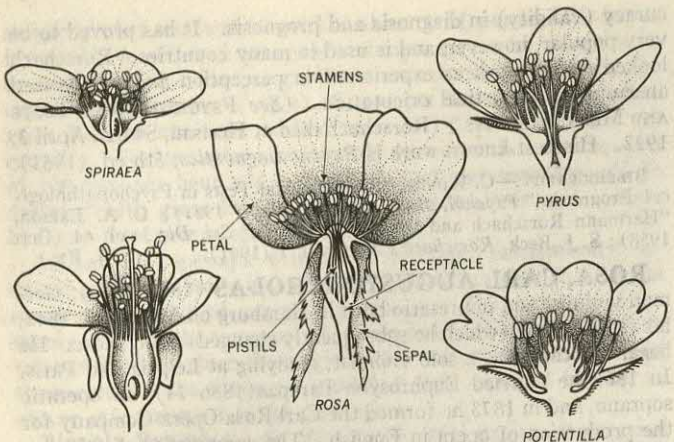
ROSACEAE, a large cosmopolitan family of seed-bearing dicotyledonous plants belonging to the order Rosales and containing about 100 genera with more than 2,000 species.

Habit of Growth.—The plants vary widely in habit of growth. Many are herbaceous, growing erect, as *Geum,* or with slender creeping stem, as in species of *Potentilla,* sometimes sending out long runners, as in strawberry; others are shrubby, as raspberry, often associated with a scrambling habit, as in the brambles and roses, while apple, cherry, pear, plum and other fruit trees represent the arborescent habit. Vegetative propagation takes place by means of runners, which root at the apex and form a new plant, as in strawberry; by suckers springing from the base of the shoot



FROM A. ENGLER, "SYLLABUS DER PFLANZENFAMILIEN," GEBRÜDER BORNTRAEGER, 1964

FIG. 1.—FLOWERS OF ROSACEAE

and rising to form new leafy shoots after running for some distance beneath the soil, as in raspberry; or by shoots produced from the roots, as in cherry or plum. The scrambling of the brambles and roses is effected by means of prickles on the branches and leafstalks.

Distribution.—In North America, Rosaceae are represented by about 40 genera, the largest being *Crataegus* (hawthorn) with about 70 or more species, *Rubus* (bramble) with 100 or more species, *Potentilla* (cinquefoil, five finger) with about 100 species, *Prunus* (plum, cherry, etc.) with 30 species, and *Rosa* with 90 species. *Potentilla* is the most generally distributed genus in the United States.

The family is characteristically typical of temperate and subtemperate regions, but some genera, such as *Rubus*, are of worldwide distribution. The strictly tropical groups are mostly trees and shrubs in such genera as *Chrysobalanus, Hirtella, Coupeia, Parinarium*, etc.

Leaf Arrangement.—The leaves, which are arranged alternately, are simple, as in apple, cherry, etc., but more often compound, with leaflets palmately arranged, as in strawberry and species of *Potentilla*, or pinnately arranged, as in the brambles, roses, mountain ash, etc. In warm climates the leaves are often leathery and evergreen. The leaves are stipulate, the stipules being sometimes small and short-lived, as in *Pyrus, Malus* and *Prunus* (cherry, plum, etc.), or more important structures adnate to the base of the leafstalk, as in roses, brambles, etc.

Flowers.—The flowers, which are regular, generally bisexual and often showy, are sometimes borne singly, as in some species of rose, or of the cloudberry (*Rubus chamaemorus*), or few or more together in a corymbose manner, as in some roses, hawthorn and others. The inflorescence in agrimony is a raceme, in *Poterium* a dense-flowered spike, in *Spiraea*, a number of cymes arranged in a corymb. The parts of the flowers are arranged on a pentamerous plan, with generally considerable increase in the number of stamens and carpels.

The shape of the thalamus, or floral receptacle, and the relative position and number of the stamens and pistils (each consisting of a stigma, style, and ovary) and the character of the fruit, vary widely and form distinguishing features of the different subfamilies, six of which may be recognized. (*See* FLOWER.)

Subfamilies.—*Subfamily I.—Spiraeoideae* is characterized by a flat or slightly concave receptacle on which the carpels, frequently two to five in number, form a central whorl; each ovary contains several ovules, and the fruit is a follicle except in *Holodiscus*. The plants are generally shrubs with simple or compound leaves and racemes or panicles of numerous small white, rose or purple flowers. This subfamily is nearly allied to Saxifragaceae, chiefly north temperate in distribution. The largest genus is *Spiraea*, with numerous species cultivated in gardens.

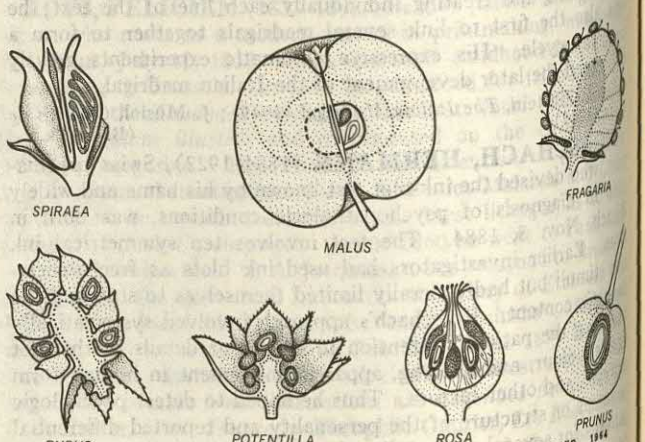
Subfamily II.—Rosoideae, the largest subfamily, with 40 genera and more than 1,000 species, is characterized by the receptacle being convex and swollen, as in strawberry, or cup-shaped, as in rose, and bearing numerous carpels, each of which contains one or two ovules, while the fruit is one-seeded and indehiscent. The genera are grouped in tribes according to the form of the receptacle and of the fruit. The Potentilleae bear the carpels on a large, rounded or convex outgrowth of the receptacle. In the large genus *Rubus* the ripe ovaries form drupels upon the dry receptacles; the genus is almost cosmopolitan, but the majority of species occur in the forest region of the north temperate zone and in the mountains of tropical America. *R. fruticosus* is blackberry, *R. idaeus*, raspberry and *R. chamaemorus*, cloudberry. In the flower of *Potentilla, Fragaria* (strawberry) and a few allied genera an epicalyx is formed by stipular structures arising at the base of the sepals.

The fruits consist of numerous dry achenes, borne in *Fragaria* on the much-enlarged succulent torus, which in the other genera is dry. In *Geum* (avens) and in *Dryas* (an arctic and alpine genus) the style is persistent in the fruit, forming a feathery appendage (*Dryas*) or a barbed awn (avens), either of which is of service in distributing the fruit. The Potentilleae are chiefly north temperate, arctic and alpine plants.

The Roseae comprise the large genus *Rosa* (with possibly 200 species) characterized by a more or less urn-shaped torus enclosing the numerous carpels which form dry one-seeded fruits enveloped in the bright-coloured fleshy torus. The plants are shrubs bearing prickles on the stems and leaves; many species have a scrambling habit resembling the brambles. The species of *Rosa*, like those of *Rubus*, are extremely variable, and a great number of subspecies, varieties and forms have been described. Petals are often wanting, as in *Alchemilla* (lady's mantle) and *Poterium*, and the flowers are often unisexual and frequently wind-pollinated, as in salad burnet (*Sanguisorba minor*), where the small flowers are crowded in heads, the upper pistillate, with protruding feathery stigmas, and the lower staminate (or bisexual), with exserted stamens. *Agrimonia* (agrimony) has a long spike of small honeyless flowers with yellow petals; in the fruit the torus becomes hard and crowned by hooked bristles, which ensure the distribution of the enclosed achenes.

Subfamily III.—Pomoideae is characterized by a deep cup-shaped receptacle with the inner wall of which the two to five carpels are united; the carpels are also united with each other, and each contains generally two ovules. The fruit is made up of the large fleshy receptacle surrounding the ripe ovaries, the endocarp of which is leathery or stony and contains one seed. The plants are shrubs or trees with simple or pinnately compound leaves and white or rose-coloured often showy flowers. The genera are distributed through the north temperate zone, extending southward in the new world to the Andes of Peru and Chile.

While some botanists still continue to include the pears and the apple and even the mountain ash in *Pyrus* as a collective genus, most now recognize three genera, *Malus* to take the apples, a genus of about 25 species, the common apple being *Malus pumila*, formerly known as *Pyrus malus; Pyrus* to take the pears, a genus of about 20 species, the common pear being *Pyrus communis*; and *Sorbus*, a genus of about 80 species to take the rowan or mountain



FROM A. ENGLER, "SYLLABUS DER PFLANZENFAMILIEN," GEBRÜDER BORNTRAEGER, 1964

FIG. 2.—FRUITS OF ROSACEAE

ash (*S. aucuparia*), wild service (*S. torminalis*), American mountain ash (*S. americana*) and white beam (*S. aria*). *Mespilus* (medlar), with a single species, and *Cotoneaster*, with about 50 species, are also included. All these genera are confined to the north temperate zone.

Subfamily IV.—Neuradoideae contains only three genera of small annual herbs of African and Indian deserts. The flowers are yellow, and the five to ten carpels are united together and with the base of the cup-shaped torus, which enlarges to form a dry covering round the one-seeded fruits.

Subfamily V.—Prunoideae is characterized by a free solitary carpel with a terminal style and two pendulous ovules, and the fruit a one-seeded drupe. The torus forms a cup from the edge of which spring the other parts of the flower. The plants are deciduous or evergreen trees or shrubs with simple leaves, often with small caducous stipules, and racemes or umbels of generally showy, white or pink flowers. There are six genera, the chief of which is *Prunus*, to which belong the plum (*Prunus communis*), with several well-marked subspecies—sloe or blackthorn (*P. spinosa*), bullace (*P. insititia*), wild plum (*P. domestica*), the almond (*P. amygdalus*) with the nearly allied peach (*P. persica*), cherry (*P. cerasus*), birdcherry (*P. padus*) and cherry laurel (*P. laurocerasus*). The subfamily is distributed through the north temperate zone, passing into the tropics.

Subfamily VI.—Chrysobalanoideae resembles the last in having a single free carpel and the fruit a drupe, but differs in having the style basal, not terminal, and the ovules ascending, not pendulous; the flowers are frequently zygomorphic. The genera are tropical evergreen trees or shrubs, the great majority being South American. *See* also STRAWBERRY; APPLE; CHERRY; PLUM.

(G. N. J.)

ROSARIO, the principal city and river port of the province of Santa Fé and the second largest city of Argentina. Pop. (1960) 671,852. Situated on the west bank of the Paraná River, 186 mi. (299 km.) NW of Buenos Aires by rail, it is accessible to ocean-going vessels of 26-ft. (8-m.) draft. The city is built 70 ft. (21 m.) above the Paraná floodplain and is laid out in a rectilinear plan with wide streets and spacious parks. Although founded in 1725 by Francisco Godoy, Rosario grew so slowly that it remained a small village until the mid-19th century. In 1856 Gen. Justo José de Urquiza (*q.v.*) made it the port of the interior provinces as a rival to Buenos Aires, and gave preferential duties on the cargoes of vessels first breaking bulk at Rosario. Increasing centralization of shipping at Buenos Aires in the 20th century retarded the growth of Rosario, although the port is well equipped with modern dock facilities and is the terminus of several shipping lines.

Principal exports include wheat, flour, hay, linseed, maize (corn), sugar, rum, cattle, hides, meat, wool, and quebracho extract, indicative of the great agricultural region of north central Argentina which Rosario serves. Its industrial structure is similarly based on the processing of a great variety of these products. Grain elevators and petroleum storage tanks are evidence of its collecting and distributing functions. There are few communication links east of the Paraná, but to the west a network of railways and roads provides easy contact with all parts of Argentina. The city's modern airport is a junction for internal services.

In addition to its great industrial, commercial, and administrative buildings, Rosario has a Renaissance-style cathedral, part of the Litoral University, and several theatres and museums.

(G. J. B.)

ROSARY (Lat. *rosarium*, "a rose garden"), a Christian devotion which in the Western Church consists of recitation of Pater Nosters, Ave Marias, and Gloria Patris while counting them on a closed string of 165 beads (chaplet) divided into 15 decades (sets) of one large bead for the Pater and Gloria and ten small beads for the Aves. The Eastern rosary (*kombologion, chotki, matanie*) is almost a purely monastic devotion. The *kombologion* (chaplet) used among the Eastern Christians of Greece and Turkey has 100 beads of the same size. The Russian Orthodox *vertitza* (string), *chotki* (chaplet), or *lievstoka* (ladder) is made of 103 beads, separated into irregular sections by four large beads and so joined together that the lines of the beads run parallel, thus suggesting the name "ladder." In the Rumanian church the chaplet is called *matanie* ("reverence") because the monk makes a profound bow at the beginning and end of each prayer counted on the beads.

The practice of counting repeated prayers is pre-Christian and was adopted in the 3rd century by Eastern Christian monks. In the West a recognizable form of the rosary emerged possibly as early as the 9th century and certainly in the 10th. In medieval England the devotion was known as the Paternoster, and Paternoster Row in London was named after craftsmen who produced strings of prayer beads. The *Livre des métiers* of Stephan Boyleau supplies full information about four guilds of *paternotriers* in Paris in 1268. The devotion received its definitive Western form *c.* 1470–75 through the preaching of the Dominican Alan de Rupe and his associates, who organized rosary confraternities at Douai and Cologne. The Roman Catholic Church calls the devotion the Rosary of the Blessed Virgin Mary. Pope Leo X in 1520 gave it pontifical approbation. In 1572 Pope Pius V established the feast of Our Lady of Victory to commemorate the victory of Christians over Turkish forces at Lepanto, Oct. 7, 1571. In 1573 Pope Gregory XIII renamed the feast Our Lady of the Rosary and in 1716, after another defeat of the Turks, by Prince Eugene in Hungary, Pope Clement XI directed its observance throughout Christendom every Oct. 7.

(H. J. Ry.)

ROSAS, JUAN MANUEL DE (1793–1877), tyrant of Buenos Aires and noted political figure in Argentine history, was born March 30, 1793, in Buenos Aires. His parents were Léon Ortiz de Rozas and Agustina López de Osornio, both of noble Spanish descent, and together they held perhaps the greatest family wealth in Buenos Aires province, consisting mainly of *estancias* (cattle ranches). Rosas received a primary education in the city of Buenos Aires, but as a young man preferred to spend his time on the family ranches where he became a complete *gaucho* (cowboy). He himself gradually acquired land south of the Salado river in Buenos Aires province, stocked it with cattle, and organized about him a force of *gauchos* trained with an iron discipline to which he was the first to subject himself.

On March 16, 1813, he married Encarnación Ezcurra y Arguibel. Then, after turning back to his parents all the properties he had administered for them, he established the large *estancia* of Los Cerrillos and a meat-salting plant in partnership with a friend.

His fame as a trainer of men brought him in 1815 the title of *oficial de milicias* and in 1820 he was made a colonel of cavalry. Col. Manuel Dorrego, Federalist leader and governor of the province of Buenos Aires, later made Rosas *comandante de la campaña*, and when Dorrego was overthrown and executed in 1828 by Juan Lavalle, Rosas took over the Federalist party command, defeated Lavalle, the leader of the *unitarios* (Centralists), and in Dec. 1829 had himself elected governor of Buenos Aires. During his three-year term Rosas gave the province the first peace it had known in many years, using bribery, political maneuvers and force to bring malcontents into line. A servile legislature made him brigadier-general and gave him the title of "Restorer of the Laws." He refused to be re-elected in 1832 and instead went south to fight the Indians, freeing white captives and capturing much-desired lands for himself and his followers.

Renewed political agitation, instigated and abetted by his followers (including his wife), brought disorder and confusion again to the province and an urgent demand for Rosas' return to power. But this time he refused to serve as governor unless granted complete dictatorial power, which the legislature gratefully gave him. In March 1835 he became dictator of Buenos Aires, a position he held until 1852. Other provincial governments permitted him to run their military and foreign affairs and usually did his bidding. Rosas refused to call a constitutional convention. His Argentine confederation (as he called it) continued under his domination as leader of the Federalist party, while the *unitarios* were pursued until captured or harried out of the land.

He quashed several revolutions that broke out against his tyranny. Killings of Rosas' opponents by his henchmen became the order of the day. By 1840 few dared oppose him.

Rosas' policies embroiled him also in foreign conflicts, including wars with neighbouring countries and with England and France. Finally a coalition of Brazilians, Uruguayans, French troops and native Argentines under the leadership of Justo José de Urquiza overthrew him in the battle of Caseros (Feb. 3, 1852). Rosas fled to England and retired to a farm near Southhampton, where he died on March 14, 1877.

Much has been written on the Rosas regime, including some comparisons with the later Péron regime. Rosas has his modern admirers in Argentina, but in general Argentine historians have been critical of his rule, pointing out at the same time that he was perhaps indispensable in his day to bring law and order to an Argentina sunk in political anarchy following the winning of independence from Spain. (F. L. Hn.)

ROSCELIN (*c.* 1050–*c.* 1125), in Latin called Roscellinus Compendiensis, French philosopher and theologian, famous as an extreme nominalist, was born at Compiègne (Compendium). Having studied at Soissons and at Reims, he taught at Compiègne, at Loches (where he had Abelard as his pupil), at Besançon and at Tours. His only extant work seems to be a violent and vulgar letter to Abelard on the Trinity; the little that is known of his doctrines is otherwise derived from St. Anselm's and from Abelard's works and from the anonymous *De generibus et speciebus*. According to Roscelin, universals are nothing more than verbal expressions (in Anselm's words, *flatus vocis*); Roscelin was, therefore, considered as the originator of extreme nominalism (*q.v.*). Again, no one thing can be divided into parts; every "part" is a whole in itself, and the division of "wholes" into "parts" is possible only in words, not in reality. Not even a syllogism is a unity; each proposition in it has a value in its own right without forming a whole with the others. Roscelin's doctrine of the Trinity, as consisting of three essences or substances—a doctrine inappropriately called "tritheism"—is partly based on the accepted Boëthian definition of *persona* as *substantia rationalis;* if God were one substance, all three persons would have been incarnated. It is not clear how this doctrine is connected with Roscelin's nominalism, nor how and whether he retracted it after his condemnation at the council of Soissons (1092).

Bibliography.—Roscelin's letter to Abelard was first edited by J. A. Schmeller in the *Abhandlungen* of the Royal Bavarian academy, vol. iii (1849–50); for a later edition *see* F. Picavet, *Roscelin, philosophe et théologien,* 2nd ed. (1911), the best documented work on Roscelin. (L. M.-Po.)

ROSCIUS GALLUS, QUINTUS (d. 62 B.C.), a Roman actor, so famous that "Roscius" was long an honorary epithet for any successful actor, was born at Solonium, near Lanuvium. He studied the delivery of distinguished advocates in the Forum, and won praise especially in comedy. Cicero took lessons from him, and the dictator Sulla presented him with a gold ring, the badge of the equestrian order—a remarkable distinction for an actor in Rome, where the profession was held in contempt. Roscius amassed a fortune by his acting; he also trained young actors, and wrote a comparison of acting and oratory. At an unknown date, perhaps in 77 B.C., he was sued by Gaius Fannius Chaerea for payment of 50,000 sesterces and was defended by Cicero in a famous speech, *Pro Roscio Comoedo.*

ROSCOMMON, WENTWORTH DILLON, 4th Earl of (*c.* 1633–1685) English poet and critic, described by Pope as the only moral writer of Charles II's time, was born in Ireland about 1633, son of Sir James Dillon, 3rd earl of Roscommon, and nephew of the earl of Strafford, then lord deputy of Ireland. He was educated privately at Strafford's house in Yorkshire and, after his uncle's impeachment (1641), at the Protestant university of Caen in Normandy: he then toured Europe. Succeeding to the earldom in 1649, he returned to England in 1660, had his estates restored to him and soon won favour at Charles II's court. It is said that he became an immoderate gambler. After passing some time in Ireland he returned to London in 1662. He planned, together with Dryden and others, to form an academy on the continental model, which was to fix and refine the language and translate classical works into English. The design came to nothing, but Roscommon translated *Ars Poetica* into English blank verse in 1680. In his *Essay on Translated Verse* (1684) he was the first critic to praise *Paradise Lost* publicly. Dryden spoke highly of the *Essay,* though Johnson thought it unimportant, and considered Roscommon "elegant but not great." His writings, though they have merit, might not have been so highly commended as they were in his own time had he been of inferior rank. Both Oxford and Cambridge conferred doctorates on him. He died in Westminster, Jan. 17, 1685.

ROSCOMMON (Ros Comáin), a county in the province of Connaught, Republic of Ireland, covers 951 sq.mi. (2,463 sq.km.). It consists mainly of the country between the Shannon River and its major tributary, the Suck, but a few miles south of Castlerea the boundary swings westward from this river through a thickly settled farmed lowland, and then eastward again along the Curlew Hills to Lough Allen, in the course of the Shannon. Only at Athlone is the Shannon boundary avoided, for the whole town on both banks is counted as part of County Westmeath (*q.v.*). Athlone is the main point of entry to the county: north of it lies Lough Ree, and a few miles upstream the Shannon has two other lakes, Bofin and Boderg. Along most of its course there are extensive water meadows, liable to flood but in dry periods giving excellent pasture known as callows. Similar meadows are widespread throughout the county.

In the area between the Shannon and the Suck the landscape is a mixture of limestone surfaces 200–400 ft. (60–120 m.) high with frequent outcrops of rock, and depressions varying from peat bogs to the natural pastures mentioned above. There are also some eskers (sand and gravel ridges) now extensively quarried for road metal and building, especially the one running west from Athlone. Within this area the farmers keep sheep and cattle, with oats, hay, and potatoes as the main crops, though wheat and some turnips and mangels (beets) are also grown. Sheep do very well on the limestone pastures, and at Roscommon town there are annual wool sales and heavy sales of lambs and sheep at the fairs.

A few miles north of Roscommon the Carboniferous Limestones are covered with drifts, with a fine series of eskers, some running north-south and others east-west. About three-quarters of the area is farmland and the rest peat bog. Drainage work on some of the bogs is being carried out for the production of milled peat. To the east of Boyle there are rich limestone grasslands known as the "Plains of Boyle" and famed as cattle pastures. Small farms of 25–30 ac. (10–12 ha.) are most usual, with a concentration on cattle rather than sheep. To the northeast of Roscommon there is a ridge, the Slieve Bawn, rising to 800 ft. (244 m.), formed of Devonian Sandstones; the Curlew Hills, on the northwestern boundary of the county, are of similar structure and altitude.

The northwest of Roscommon was MacDermott country and part of the south was in O'Kelly occupation. The native Irish interests generally prevailed, and the Anglo-Norman families on adjacent territories became Irish in their language and customs in the later Middle Ages. By the "Composition of Connaught" of 1585 a large number of the lords and chieftains of that province were given tenure at English law in their territories. Although the Composition was not given parliamentary endorsement, it governed procedure with respect to landed property there for many years. Later, since Connaught and Clare were left by Cromwell to Irish proprietors, this part of Ireland retained its Irish social pattern longer than any other, though it underwent the effects of the penal laws, the land acts, and other social changes which affected the country generally.

The population of the county was 59,217 in 1961. A county council meets in Roscommon town (pop. [1961] 1,600) and there is a county manager. There is no urban district in the county. Boyle (*q.v.*) is administered by town commissioners. Roscommon town was once similarly administered but the functions of its former commissioners have been transferred to the county council. The county sends four members to the *dáil.*

There is very little industry in County Roscommon, but the towns, and some villages, have a strong retail trade and monthly fairs. The county is almost completely dependent on agriculture

although at Arigna, in the northeast, where iron and coal were once mined, coal mining has been resumed. The coal supplies electric power to the area. Emigration continues steadily; the population declined by 6% from 1946 to 1951, by 6% again from 1951 to 1956, and 7% from 1956 to 1961. (T. W. Fr.; Hu. S.)

ROSCOMMON (Ros Comáin), a market town and the capital of County Roscommon, Republic of Ireland, lies 90 mi. (145 km.) NW of Dublin in flat rich pasture land. Pop. (1961) 1,600. The name derives from Ros, a "gentle height," and Coman, its patron saint and first bishop of the see of Roscommon, which maintained its diocesan status until 1152 when it became part of the diocese of Elphin. Coman's monastery and school were established in the 7th century on the site of the present Anglican Church and the disused graveyard behind it. It figures prominently in several of the old Irish annals. In the monastery the Cross of Cong (so called because it was discovered in an oak chest in Cong, County Mayo) was made in *c.* 1123 to enshrine a portion of the True Cross which had been presented to King Tordelbach (Turlough) O'Connor (*Annals of Tighernagh*). During the 19th century the Cross of Cong was procured for the National Museum, Dublin.

A Dominican abbey, the ruins of which remain, was founded by Felim O'Connor, king of Connaught, in 1253. The founder's tomb, with eight gallowglasses at the base, still stands under an arch in the chancel. The abbey, then partially ruined, was finally vacated in 1795. Northwest of the town are the extensive ruins of a Norman castle, built in 1269 by the justiciar of Ireland, Sir Robert de Ufford. Similar in plan to the castles of Conway, Beaumaris, and Harlech (*qq.v.*), it changed hands several times in the Irish wars and was finally dismantled by Cromwell's army in 1652. Roscommon's modern Roman Catholic Church (1903–25) is noted for its mosaics and stained-glass windows.

A royal charter of 1282 gave to the prior of St. Coman's Abbey the right to hold a weekly market on Saturday. This market continues to the present day. Roscommon's monthly fairs are well-known throughout agricultural Ireland and a cooperative livestock mart has been in operation since 1959. An Irish mosaic factory was opened in 1959 and one for making and repairing textile machinery in 1962. The town is on the main railway line from Dublin to Westport. (C. J. F.)

ROSE, SAINT, of Lima (1586–1617), the first person born in the New World to be canonized by the Roman Catholic Church, was born at Lima, Peru, on April 20, 1586, to Caspar de Flores and his wife, María del Oliva. Named Isabel at baptism, the child from her earliest days was called Rose. A financially unhappy venture in mining brought poverty to the family, forcing the girl to make early use of her skill as a seamstress to help support her brothers and sisters. Drawn to penitential practices and a life of virginity, she was opposed by her mother, who wished her to marry. The struggle between them lasted the better part of ten years, during which time Rose made a perpetual vow of virginity to strengthen her purpose. In 1606 her mother relented and allowed the girl to become a Dominican tertiary, living in seclusion in a hut in the family garden. Ridiculed and persecuted by friends and enemies, she continued a life of severe austerity, yielding only to the extent of leaving her hermitage for the last three years of her life. On Aug. 24, 1617, she died at the age of 31. Her funeral was an occasion of public honour, a belated recognition of her sanctity. In 1667 Pope Clement IX proclaimed her blessed, and four years later his successor, Clement X, issued the bull of canonization, proclaiming her at the same time patron saint of South America. St. Rose's feast is celebrated on Aug. 30.

See Latin biography by Leonard Hansen in *Acta Sanctorum*, August, vol. v; Sheila Kaye-Smith, *Quartet in Heaven* (1952).

ROSE, any of the wild or cultivated flowering shrubs of *Rosa*, a genus of between 100–200 species, about 80% of which are native to Asia, 15% to America, and the remainder chiefly natives of Europe and northwest Africa.

The rose gives its name to the botanical family Rosaceae, of which it may be considered the type, and to the order Rosales. Roses, even from widely separated regions, hybridize readily, giving rise to types that overlap the parental forms, and thus make it difficult to determine basic species. They are distributed primarily in the temperate part of the Northern Hemisphere, but some are found above the Arctic Circle and a few at the higher elevations in the tropics.

The rose flower has been closely associated with the culture of many civilizations. Not only is it a favourite flower, but it also serves as a symbol of perfection, elegance, romance, and love. The Greek poetess Sappho in her "Ode to the Rose" called it "the queen of flowers." No other flower is so universally known; the name is easily recognized in most languages of Latin or Germanic origin. The flower appears frequently in embroidery, painting, architecture, music, and literature and figures prominently in legends, customs, heraldry, and religion.

History.—The spread of the rose throughout Western Europe owes much to the advance of Islam. As the Arabs moved from Persia, which they conquered in the 7th century, the flowers of the Middle East, including the rose, followed them, eventually to Spain in the West (8th century on) and to India in the East (10th century). No doubt many roses were brought to Britain during the Roman invasion, but it is impossible to say with certainty whether *R. canina*, the common dog rose, which is a native of the east Mediterranean, is also a native of Britain. Roses were also brought to Britain from the East during the Crusades (11th century on).

Uses and Importance.—Roses have been used in medicines, and during and since World War II rose fruits, or hips, have been utilized as a source of vitamin C, largely from *R. rugosa*. Rose petals can be used in cookery, particularly in crystallized form for confections, and extracts containing the essential oil, which gives the fragrance, are used for flavouring desserts or for scent in cosmetics and perfume. Many acres are devoted to rose production for garden and greenhouse culture in the leading countries of the world. The great variation in habit of growth makes them useful in almost any landscape situation. In India, Iran, the Balkans, and France, large quantities of blooms are grown for the production of the fragrant attar of roses (*q.v.*), used in perfumes.

Roses are prized chiefly for their blossoms, which range from white through various tones of yellow and pink to dark crimson and maroon. Many varieties have been bred with beautiful blends of colour. The form of the rose bloom varies from the delicate primitive charm of the wild roses to the fully double, high-centred, sculptured blooms of the modern hybrids. Size ranges from the tiny miniatures not more than one-half inch in diameter to exhibition flowers seven inches or more across. Few persons fail to enjoy the delightful fragrance of most roses, which varies according to the variety and climatic conditions. While the typical rose odour is that produced by the damask and similar roses, the scent of other kinds may suggest spices, fruits, hay, other flowers, or, as in the case of the tea rose, fresh green tea leaves. Many species and varieties have brilliantly coloured hips during the autumn and winter.

Plant Characteristics.—Roses are erect, climbing, or trailing shrubs, never true trees (though grafted sorts called standards, with a main stem, resemble small trees). Their stems are generally more or less copiously armed with prickles of various shapes and sizes called thorns. The leaves, invariably alternate and provided with stipules that are often aromatic glandular, are composed of pinnately arranged leaflets, varying in number from 1 to 11 or more, the odd leaflet always being at the apex, the others in pairs. The flowers are solitary or in loose clusters produced at the ends of the shoots. The flower stalk expands into a fleshy vase- or urn-shaped hypanthium, called the receptacle, receptacular tube, or hip, which ultimately will contain the numerous seeds (achenes).

From the edge of the hypanthium proceed five sepals, often more or less compound like the leaves and overlapping in the bud. Within the circle of sepals are five petals, generally broad or roundish in outline. The numerous stamens originate slightly above the sepals and petals; each has a slender filament and a small two-celled anther. The stamens are arranged in several concentric whorls. In many rose varieties stamens become pet-

aloid, giving rise to the full double flowers so much admired by gardeners. The carpels are numerous, covered with hairs. Each is provided with a long style and buttonlike stigma. The carpels are concealed within the hypanthium, and only the stigmas as a rule protrude from its mouth. Each carpel contains one ovule. The ovules contain the female gametes or sex cells, and the anthers contain the male gametes in the pollen grains. The hips, which follow the flowers, are eaten by birds, thus the seeds contained in the hips are readily dispersed.

Under natural circumstances rose flowers do not secrete nectar, the attraction for insects being provided by the colour and perfume and the abundance of pollen for food. The stigmas and anthers come to maturity at the same time; consequently, while cross-pollination by insects is common, self-fertilization can occur.

Species.—Roses grow wild in various countries of the Northern Hemisphere. Of the more than 100 species not more than nine have been concerned in the breeding of garden roses. Probably the oldest of these is the French rose (*R. gallica*), a small shrub, three to four feet high, bearing single deep pink to crimson flowers. A native of southwest Europe, it was known in the 12th century B.C. and about 500 years later was used as the emblem of the Medes and Persians. In its form *R. gallica officinalis,* it was the red rose of Lancaster. *R. moschata,* the musk rose, a native of the Himalayas, is a tall-growing shrub bearing clusters of single, white roses. In its cultivated double form it spread rapidly westward across Greece and Italy to France and ultimately reached England in the second half of the 16th century. *R. gigantea* and *R. multiflora,* natives of eastern Asia, are also tall shrubs with long trailing branches. *R. wichuraiana,* the memorial rose, also a native of east Asia, has a prostrate habit with creeping branches and single white flowers, 1½–2 in. in diameter, in clusters. Another rose that has played an important part in the development of modern roses is *R. chinensis,* a double form of *R. gigantea* and cultivated largely in China (*R. chinensis* is synonymous with *R. indica* and is known both as the China rose and the Bengal rose). It is a low-growing bush, the double flowers of which vary much in colour, red, pink, and yellow varieties being known. Some of its varieties have strong fragrance (*e.g., R. chinensis fragrans,* usually known as *R. odorata*), and all, but notably *R. chinensis semperflorens,* the Chinese monthly rose, have the property of perpetual flowering.

By crossings of these early species the various types of modern garden roses have been developed. *R. gallica* × *R. canina* produced *R. alba,* the white rose of York, while complex hybrids of *R. gallica, R. moschata,* and possibly also *R. canina* and *R. phoenicia* (a native of the east Mediterranean) produced the *centifolias* (cabbage roses), which in turn mutated to produce the small, close-petaled moss roses so beloved during the Victorian era.

A class of roses known as the damask roses (*R. damascena*) resulted by crossing *R. gallica* and *R. moschata. R. damascena* was, and still is, used in large quantities in the making of attar of roses.

Other important and epoch-making rose crosses were:

R. chinensis × *R. moschata* = the noisette roses; 1802 at Charleston, W.Va. These were treasured varieties till 1890.

Noisette roses × hybrid chinas = tea roses, which were in great favour from 1830 to 1900.

R. damascena × hybrid chinas = Bourbon roses, popular from 1817 to 1870. These were delicate roses that flourished in the open in warm climates only. They were first grown in the Ile de Bourbon in the Indian Ocean.

R. chinensis × *R. gallica* × *R. damascena* = the Portland rose, a much hardier type than the Bourbons.

Bourbons × Portland = hybrid perpetuals. These were strong growing varieties, some with a strong fragrance, but were not so perpetual in their flowering period as their name implies. They were the popular garden rose from 1840 to 1900, but few are grown today, although in Britain forms such as "General Jacqueminot," "Ulrich Brunner," "Mrs. John Laing," "Reine des Violettes," and "Baron Girod de L'Ain" are still to be found in the gardens of the connoisseurs.

Hybrid perpetuals × tea roses = hybrid tea, a variety which has held sway as a garden rose since 1867 with the introduction of "La France."

R. foetida introduced yellow into the hybrid tea roses from 1900 onward and enriched the colour range by shades from pale yellow to orange.

R. multiflora × hybrid chinas, and later crossed with other cultivated varieties, produced two classes of roses: first, a class of hybrid polyantha climbers such as "Paul's Scarlet Climber" and "Chaplin's Pink"; and second, seedlings of *R. multiflora* × hybrid chinas resulting in the dwarf everblooming poly pompons; *e.g.,* "Pâquerette" and "Mignonette," which became the ancestors of "Orleans rose," "Miss Edith Cavell," and "Coral Cluster."

Poly pompons × hybrid teas = hybrid polyanthas, the first of which was "Else Poulsen" (1924). This was followed by others named after the members of the family of the raiser, Danish rose breeder Svend Poulsen.

Subsequent crossings of the hybrid polyanthas with more complex hybrid teas, hybrid perpetuals, and hybrid musks have rendered the name hybrid polyantha a misnomer. This new class, which includes a wide range of roses in great variety of colours, is best known as floribundas, the tall and more shrublike varieties of which are known in America as grandifloras and in Britain as floribunda hybrid tea type or floribunda shrubs.

R. wichuraiana × tea and hybrid tea roses produced the glossy leaved ramblers; *e.g.,* "Alberic Barbier," "Albertine," and "American Pillar." These roses are often made to climb by tying them to supports rather than letting them trail down banks as is their natural habit; if budded on tall stems, they make attractive weeping standards.

R. spinosissima, the Scotch rose, a low bush densely provided with slender prickles and producing white, pale pink, or yellow flowers, depending on where it is grown, was used between the years 1937–1950 by the German hybridist W. Kordes to produce such fine roses as "Frühlingsgold," "Frühlingsmorgen," and "Frühlingsanfang." In America, *R. spinosissima* was used to produce "Golden Wings," a vigorous shrub with recurrent large single blooms of a sulfur-yellow colour.

The ramblers previously mentioned were exclusively summer flowering. In 1952 *R. kordesii* arose in cultivation as a result of spontaneous chromosome doubling in a *R. rugosa* × *R. wichuraiana* hybrid "Max Graf." By crossing this new species with the large flowered rambler "Golden Glow," the first of a race of repeat-flowering climbers, "Köln am Rhein," was produced. These are known as Kordesii climbers.

The numerous roses native to North America belong to about 35 species. The smooth rose (*R. blanda*), usually lacking prickles and having flowers about three inches broad, occurs abundantly from Newfoundland to Saskatchewan and southward to New Jersey and Missouri. The prickly rose (*R. acicularis*), with spiny stems, leaves composed of five to nine leaflets, and solitary flowers two and one-half inches broad, ranges from Quebec to Alaska and south to Colorado. The pasture rose (*R. virginiana*), from one half to six feet high, with few or solitary flowers two to three inches across, sometimes double, occurs from Newfoundland to Wisconsin and south to Georgia. This is the commonest wild rose of the eastern states and Canada. The prairie rose (*R. setigera*), a large shrub with a tendency to climb and with leaves usually composed of three leaflets, bears rose-pink flowers that turn white with age. This handsome rose, which grows wild from Ontario to Wisconsin and south to Florida and Texas, has become naturalized eastward to New England. The California rose (*R. californica*), a sparsely prickly shrub three to nine feet high, flowering nearly the year round, sometimes forms thickets along streams.

The following are interesting species (or hybrids) not previously mentioned and often grown as shrubs. *R. eglanteria,* the eglantine or sweetbrier, is a stiff, erect, branching bush with pink-tinged white blooms and sweet-smelling foliage. The large-fruited apple rose, *R. pomifera,* is prized for its large scarlet hips, which may be one inch or more in diameter. *R. arvensis,* the parent of the Ayrshire rose, is a very thorny shrub with more or less decumbent or creeping branches. *R. rubrifolia* is an unusual shrub because of its reddish glaucous stems and gray foliage. The cinna-

mon rose, *R. cinnamomea,* is a hardy old garden species common along fences and roadsides; it has double, fragrant blooms in shades of red, two inches or more across.

R. rugosa is a remarkable species because of its bold rugose foliage, its large red, pink, or white flowers, and its conspicuous fruits. *R. moyesii* is an attractive ten-foot shrub with two and one-half inch deep-red flowers. *R. hugonis* is a handsome, hardy shrub producing an abundance of light-yellow flowers in early spring. The Macartney rose (*R. bracteata*), introduced into England from China, is a stout evergreen shrub producing drooping shoots 10 to 20 ft. long. The Cherokee rose (*R. laevigata*) is a rampant plant that climbs over fences and trees; it is widely planted in the southern United States, where it has run wild and appears to be indigenous. The Lady Banks rose (*R. banksiae*) is a high-climbing evergreen with few or no prickles and smooth slender twigs; the flowers are about one inch across, single or double, white or yellow, somewhat fragrant, and borne in umbellike clusters.

The number of cultivated clones, or horticultural forms, is very large, more than 100 being introduced into commerce each year. To facilitate grouping clones with similar characteristics, a complicated horticultural classification has evolved that is often inconsistent. In some cases it is based upon origin from wild species, in others upon habit of growth or manner of flowering. There is considerable overlapping and mergence of classes as the result of extensive interbreeding.

Among bush roses, the main classes include hybrid perpetuals, teas, hybrid teas, polyanthas, hybrid polyanthas, and floribundas. Climbing roses are classed as ramblers, large-flowered climbers, everblooming hardy climbers, climbing forms of hybrid teas, floribundas and other bush types, and trailing varieties. A comprehensive list is given in J. H. McFarland's *Modern Roses V* (1958), which includes 7,562 names. The list, however, represents only a small proportion of the roses hybridized and named during the preceding 250 years.

Propagation.—Roses are propagated by seeds, cutting, layering, grafting, and budding. Most rose seed requires a stratification treatment (cold storage in a moist medium) to hasten germination. Commercially, rose plants are produced largely by budding the desired clone onto an understock. In Europe, forms of *R. canina* and, particularly on light soils, *R. multiflora simplex* are used extensively; in the U.S., forms of *R. multiflora* are commonly used, although in some areas "Gloire des Rosomanes" (Ragged Robin), "Dr. Huey," and forms of *R. odorata* are employed. Tree, or standard, roses are budded from two to six feet above ground level on a tall, straight cane of the understock. For this purpose, forms of *R. canina, R. multiflora,* and *R. rugosa* are commonly used. Plants for greenhouse culture are usually budded on Manetti roses (*R. noisettiana manetti*), but *R. canina* may be used as well. For half-standards, *R. rugosa* is a good stock.

Cultivation.—It is important to select a proper location for the rose garden. In moderate or cool climates, full sun is desirable. Where summers are hot, shade during part of the day, particularly in the afternoon, is beneficial. Good drainage is essential; if the site has a tendency to become waterlogged, a tile drainage system should be installed or the beds should be raised well above the surrounding ground level. Roses should be planted away from trees or shrubs whose roots may invade the bed and compete for water and nutrients. Protection from strong winds should also be provided. Incorporating well-rotted manure, leaf mold, compost, peat moss, or similar organic substances is recommended to lighten densely compacted soil. Ideally the soil should be slightly acidic (pH 5.5–6.5). Lime can be applied to overly acid soil; alkaline soil may be acidified with ferrous sulfate or powdered sulfur.

Most roses are set out as dormant bare-rooted plants in the spring or autumn depending upon the climate and condition of soil. Mounding soil around the base of the plants after planting helps protect the stems from drying out until the roots are well established. Bushes with developed root systems, for planting at other seasons, are available in containers.

Roses respond well to annual topdressing with rotted manure or periodic applications of liquid manure or inorganic fertilizers. Watering the beds immediately after fertilizer is applied is recommended. Thorough watering is essential; this means soaking the soil to a depth of six to eight inches. Damping the surface is useless, in fact harmful, as it tends to stimulate surface roots, which soon dry out.

Cultivating the beds, to eliminate weeds, and keeping the surface loose and well aerated is recommended, but cultivation should not be so deep as to destroy roots. A better practice is mulching with grass clippings, peat moss, buckwheat hulls, ground corncobs, or rice hulls, layers of which conserve moisture, keep down soil temperature, and discourage weeds.

Pruning keeps the plants in vigorous condition and improves their quality and appearance. The different classes and even different varieties in the same class may respond to different pruning treatment, but in general the practice for bush roses involves cutting out all dead or injured wood in the spring, removing weak, twiggy growth, and cutting back the strong canes to a moderate height to give a well-balanced appearance. Ramblers that bloom only once during the season are best pruned immediately after flowering. Withered blooms should be removed promptly from everblooming climbers so that new flowering shoots will be stimulated to grow.

Where the temperature normally goes below 5° F (−15° C), protection during the winter is necessary. This is accomplished by mounding soil around the base of the plants before the surface freezes and later, after a heavy freeze, covering the mounds with evergreen boughs, marsh hay, straw, or other coarse insulating material to prevent alternate thawing and freezing. Where climbing roses are likely to freeze, their canes may be released from their supports, laid on the ground, and covered with soil; in the spring the canes are again tied back on the supports.

COMMON WILD ROSE (ROSA HUMILIS) AND DOMESTIC GARDEN ROSE

Diseases and Pests.—Roses are infected by a number of diseases, most of them caused by fungi. Powdery mildew is widespread wherever roses are grown and is observed as a grayish-white moldlike growth on the surface of young leaves, stems, and buds. Copper and sulfur fungicides are effective as controls when applied either as a spray or dust.

Black spot may occur in humid climates, if certain precautions of culture are not taken. Shortly after conspicuous black spots appear on them, the leaves drop. Heavy dews following hot days favour the development of the spores. If the surface of the leaf remains wet for a period of about six hours, the spores can germinate and cause infection unless the surface of the leaf is protected by a thin film of fungicide. Fixed or insoluble copper fungicides, finely powdered, or wettable sulfur are standard control chemicals. There are also a number of patented organic fungicides, such as Ferbam and Captan, that are highly effective if applications are timely and thorough. Spraying early is essential. Removing infected leaves as soon as a spot is detected and keeping all fallen leaves removed from the surface of the bed is recommended.

Rust appears on both cultivated and wild roses in the spring, bursting through the bark in the form of masses of orange powder consisting of the spores of the fungus. In early summer the spores infect the leaves and produce on them small orange dots and, later, groups of spores, mainly black, that can survive the winter. It is important that all affected leaves be destroyed in the autumn and the bush be sprayed with a copper, sulfur, or Ferbam fungicide in the spring to prevent infection of leaves by spores carried from stems on which they may have wintered.

Other diseases that are sometimes troublesome are canker, crown or root gall, and anthracnose.

Among the number of insects that may prove troublesome, aphids are common but are easily controlled by nicotine spray or dust or many other insecticides. Various caterpillars, sawfly larvae, and similar insects feed on the leaves and young shoots. These pests are easily controlled by stomach poisons such as arsenate of lead or DDT. Red spider mites, which multiply in great numbers, largely on the undersides of the leaves, are difficult to see and may cause extensive damage before being discovered. Materials such as Malathion, Aramite, and Ovatran are available for their control. Other insect pests are thrips, earwigs, midge, and scale insects, all of which can be reasonably well-controlled by the newer insecticides.

ROSEBERY, ARCHIBALD PHILIP PRIMROSE, 5TH EARL OF (1847–1929), British statesman, prime minister from March 1894 to June 1895, orator and racehorse owner, was born in London on May 7, 1847. His father, Archibald Primrose, son of the 4th earl, died before Archibald was four; so as heir to the earldom he bore the title of Lord Dalmeny at Eton, where Arthur James Balfour and Lord Randolph Churchill were among his contemporaries, and where he developed his brilliance of speech and manner. He went down from Christ Church, Oxford, without a degree at Easter 1869, rather than abandon, as the college authorities required, the small racing stud he had already formed. In 1868 he succeeded to the earldom and to large estates in Scotland, including the great house at Dalmeny near Edinburgh. To this and to Rosebery, a shooting lodge in Peeblesshire, he soon added The Durdans, a large country house near Epsom; in 1878 he married Hannah, orphan daughter of Baron Meyer de Rothschild, who brought him the Buckinghamshire palace of Mentmore; he had a town house in Berkeley Square, and in 1897 he bought a villa on the Bay of Naples. These details may help to give a key to this fastidious character, for whom nothing but the best was ever good enough. Another key may be found in the remark of a woman who knew him well: "It is a curiously cold, impassive face, but surely his smile is the most irradiating that has ever been seen. He is absolutely transformed by it."

While still an undergraduate he refused in 1867 the offer of a safe Conservative seat at Darlington and his political principles, as they developed, turned gradually toward the Liberal interest. But his Liberalism was always Whiggish and lukewarm and was tinged with a keen regard for British grandeur and a strong sense of imperial destiny; it was accompanied also by a full sense of his own importance. In politics he was in fact a prickly subordinate, a difficult colleague, and an almost impossible superior. Indeed, though he rose to be prime minister at the age of 46 and died at the age of 82, his temperament was such that his ministerial career filled less than seven years, and his premiership was unusually brief.

Office under Gladstone.—Rosebery never sat in the House of Commons, but he had some direct experience of constituency life, for it was at his suggestion, with his help, and as his guest, that Gladstone fought the Midlothian campaigns of 1879 and 1880 which regained power for the Liberal Party (*see* GLADSTONE, WILLIAM EWART). Rosebery was at first too sensitive, and then too ill, to take any office at the beginning of Gladstone's second administration (1880–85). However, from 1881 to 1883 he served as undersecretary at the home office, with special charge of Scottish affairs, and his insistence that Scotland should be given more careful and more special treatment by the civil service led to the formation of the modern Scottish office in 1885. But he was often in need of careful and special treatment himself; he was a constant trial to the prime minister, and the mediation of Edward Walter Hamilton, an old school friend who was Gladstone's private secretary, was often needed to keep Rosebery pulling in harness. He resigned in June 1883 when attacked in Parliament on a minor matter and went on a journey round the world. However, at the moment of the Khartoum disaster in 1885 he placed himself again at Gladstone's disposal, and entered the cabinet for a few months (March–June) as lord privy seal. He stood by Gladstone when the Liberal Party split over Home Rule for Ireland and at Queen Victoria's suggestion he became foreign secretary in the short government of February–July 1886. He had little time to do more than get to know his staff, and to set out the doctrine that British foreign policy continues much the same irrespective of the party in power.

During the following six years spent in opposition by the Liberal Party he took some part in London local government. In January 1889 he was elected chairman of the newly formed London County Council, and held that post till July 1890. He held it again for a few months early in 1892; but meanwhile he had been stricken by a private calamity from which he never altogether recovered. His devoted wife, who had borne him two sons and two daughters, had participated in all his interests; suddenly, in October 1890, she caught typhoid fever, and died six weeks later. Rosebery was desolated. Her fortune of £800,000 was no consolation for the loss of her presence, her advice, and her love. He never remarried.

He would have preferred to mope alone; but family and friends insisted that he labour on at politics. He tried hard to avoid office in Gladstone's last government (1892–94), and was forced back to the Foreign Office much against his will. His ideas about the conduct of foreign and imperial policy diverged sharply from those of Gladstone, and the usual "committee of two" (prime minister and foreign secretary) that directs British affairs abroad failed to operate. The quarrel went so far that for 18 months from the autumn of 1892 important dispatches went abroad with the queen's sanction, but without that of the prime minister. Rosebery immediately disagreed with Gladstone about the proper policy to follow in Uganda, where the British East Africa Company was in financial difficulties. He succeeded in deferring the withdrawal of British control favoured by Gladstone, Sir William Harcourt, and the more radical half of the cabinet, and was eventually able to bring the territory under a British protectorate (1894). He

devoted energy and temper in 1893 to a dispute with France about the boundaries of French and British spheres of influence in Siam, and secured an arrangement reasonably advantageous from the Siamese and the British point of view. The much more important problem of the shift in the European balance of power, brought about by the conclusion of the Franco-Russian alliance of 1894, seems to have eluded his attention altogether. He continued the marquess of Salisbury's policy of secret collaboration with the Triple Alliance (Germany, Austria-Hungary, and Italy). However, he repudiated Salisbury's second Mediterranean agreement (December 1887) with Austria-Hungary and Italy, which created Britain's obligation to support them in maintaining the independence of Turkey, saying he had not seen the actual document, which was kept in his permanent secretary's safe. Oddly enough, Rosebery got on better with his colleagues and showed more skill in diplomacy over home affairs than foreign; under his chairmanship a troublesome conflict between coal miners and coal owners was brought to a compromise in November 1893.

Prime Minister.—In the dispute over the increase in the naval estimates (December 1893), which Gladstone opposed and which finally drove him from office, Rosebery took a leading part against the prime minister. Had she asked his advice, Gladstone would have recommended Lord Spencer to the queen as his successor, and public opinion favoured Harcourt, but on her own initiative Victoria sent for Rosebery, who reconstructed the Liberal cabinet with few changes in March 1894. His government lasted for 16 months. It achieved practically nothing; partly because the House of Lords sedulously rejected every Liberal measure except the budget, as a matter of Conservative principle, so that no legislation could be passed; and partly because Rosebery's colleagues were known to be bitterly divided. These divisions cut so deep that Rosebery and Harcourt, his chancellor of the exchequer and leader of the Commons, are said hardly to have spoken to each other directly for more than six months. Although such ludicrous discord did not originate by any fault of Rosebery's, he lacked the qualities to resolve it. When his government was accidentally defeated in the Commons on a minor war office vote in June 1895, he seized the excuse to resign. The subsequent election, which returned a large Conservative majority, seemed to show that the electorate had little use for Gladstonian Liberals without Gladstone.

Though the time during which he was prime minister was politically unrewarding and personally agonizing for Rosebery it did include a notable feat; his racing stable, long nourished, not only won the Derby of 1894 with Ladas but won it again in the following year with Sir Visto. This achievement, nevertheless, was harmful to Rosebery's standing with the dour Nonconformists who formed the backbone of his party in the country, and it confirmed them in their suspicion that he was a playboy. (Rosebery did once more own a Derby winner, Cicero, in 1905, but by that time he was set markedly apart from his former colleagues, though still far apart from his former opponents.)

Gradual Retirement from Politics.—He resigned the leadership of the Liberal Party in October 1896, because he thought the aged Gladstone's protests at the Armenian massacres inexpedient, and was both too fond of him and too keenly aware of Gladstone's standing in the Liberal Party to care to lead against the retired titan's published views. Sharper differences with the Liberals followed during the South African War (1899–1902). Rosebery was a leading Liberal Imperialist, and gave much offense to radicals in his own party and to the left of it, particularly by a speech at Chesterfield in December 1901 that referred to "fly-blown phylacteries" of the Liberal Party. His efforts to stimulate Liberal imperialism had considerable effects, though principally among Conservatives; the main body of the Liberal Party paid him little attention. His final separation from the party came with his Bodmin speech, a few weeks before the Liberals came back to power in December 1905; in it Rosebery declared himself no longer a supporter of Home Rule. While the new government was introducing a program of social legislation (*see* ENGLISH HISTORY: *Edwardian England*), Rosebery was yachting in the Mediterranean, or adjusting the affairs of distressed jockeys, or writing some of his excellent historical essays. A note of his found after his death makes clear what he thought his position was.

> The secret of my life, which seems to me sufficiently obvious, is that I always detested politics. I had been landed in them accidentally by the Midlothian Election, which was nothing but a chivalrous adventure. When I found myself in this evil-smelling bog I was always trying to extricate myself. That is the secret of what people used to call my lost opportunities, and so forth. If you will look over my life you will see that it is quite obvious. But nothing is so obvious as the thing which one does not wish to see.

Rosebery made a brief reappearance in politics in September 1909, to attack Lloyd George's budget as rapacious and socialistic; and another at the end of 1910, when he brought forward proposals he had often pressed before, intended to make the House of Lords a strong second chamber. Membership was to consist of lords of Parliament, who were to be chosen from the body of hereditary peers by the peers themselves, and from others outside the House. Although carried in the Lords, the scheme was unacceptable to the Commons majority, which desired a weaker second chamber, not a stronger one. Rosebery voted for the Parliament bill in August 1911, sooner than see the lords swamped by a mass creation of new peers, but he registered a protest against it in the journals of the House. This was his last act in party politics.

It was by no means his last act in public. He was much more than a witty and graceful speaker; he was one of the most accomplished orators of his day, and if people could not hear him on party politics, they would hear him with pleasure on anything else. As a principal Scottish dignitary, Rosebery played a substantial part in mobilizing the Scots for World War I and in sustaining their efforts. Dalmeny was turned into a hospital, and in circumstances of deep distress (his younger son Neil and two nephews were killed in action), he devoted himself unreservedly to stimulating the will to fight. In November 1918, a few days before the war ended, overexertion brought on a stroke, which left him partly crippled for the rest of his life, though for many years his intellect remained clear and his conversation fascinating. He died at The Durdans on May 21, 1929, and was succeeded as 6th earl by his elder son Albert. Rosebery wrote four books, *Pitt* (1891), *Napoleon: the Last Phase* (1900), *Lord Randolph Churchill* (1906), and *Chatham* (1910). A collection of his essays and speeches, *Miscellanies, Literary and Historical,* edited by John Buchan, was published in two volumes in 1921.

See Lord Crewe, *Lord Rosebery,* 2 vol. (1931); R. R. James, *Rosebery* (1963); P. Stansky, *Ambitions and Strategies* (1964).

(M. R. D. F.)

ROSECRANS, WILLIAM STARKE (1819–1898), Union officer during the American Civil War, was born in Kingston, O., Sept. 6, 1819, and graduated from West Point in 1842. After 12 years as a regular army officer he resigned to enter business in Ohio until the Civil War brought him back to military service. He served under Gen. George B. McClellan and Gen. John Pope and succeeded each when they moved east to larger commands. During 1862 he led the Union forces to victory in the battles of Iuka and Corinth, after which he moved on to Nashville to the command of the Army of the Cumberland. He fought the bloody and indecisive battle of Stone (or Stones) River (Murfreesboro) Dec. 31, 1862–Jan. 2, 1863. His aggressive spirit had pleased his Washington superiors, who were looking always for a fighting general, but now he began to show other qualities: an excess of caution and hesitancy, a disposition to worry and to argue with his superiors. Finally, on June 23, 1863, after six months of delay in the face of official pressure to take the offensive, he pushed Gen. Braxton Bragg into Chattanooga, then maneuvered him out of the city without a battle. Here his customary caution deserted him and he followed Bragg who turned upon him at Chickamauga (*q.v.*), Sept. 19–20. An ill-advised move opened a gap in his lines and allowed the Confederates to pour through and drive him and a part of his army back into Chattanooga (*q.v.*). Only the stand of Gen. George Thomas on the Union left averted complete disaster. Gen. U. S. Grant, now charged with the defense of Chattanooga, removed Rosecrans, ending any important role for him in the war.

Rosecrans resigned his army commission in 1867. He served

for two years as minister to Mexico (1868–69) and later engaged in mining operations in Mexico and California. He served in congress, 1881–85, from California, and afterward became register of the treasury. He retired to California in 1893 and died there on March 11, 1898. (C. W. Te.)

ROSEGGER, PETER (1843–1918), Austrian novelist and poet, was born at Alpl, near Krieglach in Styria (Steiermark), on July 31, 1843. The son of a peasant, he became a traveling tailor. His many novels paint a picture of the landscape and customs of his homeland, and he achieved wide fame, notably with *Waldheimat* (1877; English translation, *The Forest Farm,* 1912) and *Die Schriften des Waldschulmeisters* (1875; English translation, *The Forest Schoolmaster,* 1901). His religious and autobiographical writings (*Der Gottsucher,* 1883; English translation, *The God-Seeker,* 1901; *Mein Weltleben,* 1898) were also popular. His dialect stories were collected in four volumes (1894–96) and his *Gesammelte Werke* (40 volumes) appeared in 1914–16. He died at Krieglach on June 26, 1918.

ROSE HILL, Mauritius: *see* Beau Bassin-Rose Hill.

ROSELLE and **ROSELLE PARK,** boroughs in Union County, N.J., U.S., adjoining Elizabeth on the west, are suburban residential communities of the New York metropolitan area and also have factories whose products include rugs, toys, restaurant equipment, surgical supplies, and leather goods. Roselle, incorporated in 1894, is the site of the birthplace of Abraham Clark, one of the New Jersey signers of the Declaration of Independence. Thomas A. Edison's experiments there made Roselle the first community to be completely lighted by electricity.

Roselle Park, once named North Roselle, was incorporated in 1901. Guglielmo Marconi, inventor of the wireless, established a plant there in 1913 which during World War I was a leader in the manufacture of communications equipment. KDY, a pioneer commercial radiobroadcasting station, was located there in 1921.

For comparative population figures *see* table in New Jersey: *Population.* (E. R. D.)

ROSEMARY (*Rosmarinus officinalis*), a low shrub of the mint family (Labiatae) whose leaves are used as seasoning. The only representative of the genus is a native of the Mediterranean region. It has evergreen linear leaves, dark green above, white beneath, and with margins rolled back onto the under face. The flowers are in small axillary clusters. Each has a two-lipped calyx, from which projects a bluish two-lipped corolla enclosing two stamens. The fruit consists of four smooth nutlets. Rosemary was highly esteemed by the ancients for its aromatic quality and medicinal uses. In modern times it is valued mainly for its perfume; the oil is obtained by distillation. Rosemary plays an important part in literature and folklore, being an emblem of remembrance. It is widely grown in gardens in the warmer parts of the U.S. and in Great Britain, where an old garden legend reads "where rosemary thrives the mistress is master." (N. Tr.)

ROSENBACH, ABRAHAM SIMON WOLF (1876–1952), U.S. book and manuscript collector and dealer, who combined solid scholarship and exceptional business acumen, was born in Philadelphia, Pa., on July 22, 1876. He attended the University of Pennsylvania (B.S. 1898; Ph.D. 1901) where as a freshman he bought for $3.60 a first edition of Dr. Johnson's prologue at the reopening of Drury Lane Theatre in 1747 for which he later refused $5,000. From 1895 to 1901 he was a teaching fellow in the English department, and before 1903 he joined his brother Philip, a book dealer, in launching the Rosenbach Company. Upon the death in 1903 of their uncle, Moses Polock, whose bookshop Rosenbach had haunted since his childhood, the brothers acquired a substantial collection of his books and were soon in a position to buy entire libraries, expanding their business into what may well have been the most lucrative book concern in the world. Among his clients were Henry E. Huntington, founder of the library bearing his name at San Marino, Calif., and J. Pierpont Morgan, founder of the library bearing his name in New York City. In 1947, Rosenbach bought a copy of *The Bay Psalm Book* for $151,000, then a record price. A shrewd bibliophile, Rosenbach came to be the most formidable bidder of his time at auctions in the U.S. and Europe. The total of his purchases was estimated as exceeding $75,000,000. In addition to a wealth of English literature and Americana, Rosenbach acquired a magnificent collection of children's books that he later presented to the Philadelphia Free Library; he bought 8 Gutenberg Bibles and more than 30 Shakespeare first folios. He published a great many bibliographical and literary articles; his checklist *Early American Children's Books* (1933) is a standard reference. In 1930 he established the Rosenbach Fellowship in Bibliography at the University of Pennsylvania, and upon his death in Philadelphia on July 1, 1952, willed his estate to the Rosenbach Foundation, established in 1950 to foster interest in books, paintings, and *objets d'art.*

His other works include *Books and Bidders* (1927), *The Unpublished Memoirs* (1917) and *A Book Hunter's Holiday* (1936).

See E. Wolf and J. F. Fleming, *Rosenbach* (1960).

ROSENBERG, ALFRED (1893–1946), the ideologist of German National Socialism, was born on Jan. 12, 1893, in Reval (Tallinn) in Estonia (then part of Russia), the son of a German shoemaker. He went to Moscow to train as an architect, but left after the Revolution. In 1919 he went to Munich, taking with him the *Protocols of the Learned Elders of Zion,* a spurious 19th-century work claiming to expound a Jewish conspiracy to achieve world domination. In Munich he joined Hitler, Ernst Röhm, and Rudolf Hess in the nascent Nazi Party. In 1921 he became editor of the party newspaper *Völkischer Beobachter.* He propounded anti-Semitic and anti-Bolshevik views, drawing on the *Protocols* for his inspiration. He also expounded the ideas of H. S. Chamberlain (*q.v.*). In November 1923 he participated with Hitler in the Munich *Putsch.* When Hitler was imprisoned he placed the leadership of the party in Rosenberg's hands, knowing him to be weak and incompetent as an organizer, and thus unlikely to establish a position of power.

In *Der Zukunftsweg einer deutschen Aussenpolitik* (1927) Rosenberg advocated a ruthless drive eastward; *i.e.,* the conquest of Poland and Russia. In *Der Mythus des 20. Jahrhunderts* he laboriously claimed to reveal the origins of a Nordic race, deriving its character from the pure, cold, semi-Arctic continent, now disappeared, which was its homeland. The Germans, as the representatives of this pure Nordic race, were entitled to dominate Europe. The enemies of the Nordic race were shown as "Russian Tatars" and "Semites," the latter being a racial force far wider than modern Jewry, embracing the Latin peoples, and including in its scope Christianity, particularly the Catholic Church.

Hitler probably never read the *Mythus* but his contact with Rosenberg had a great effect on him, providing a *Weltanschauung* which gave a confused order and direction to his own prejudices, hatreds, and ambitions. In 1931 he put Rosenberg in charge of the foreign policy office of the Nazi Party, but he was given no ministerial office when Hitler came to power, and had no impact on foreign affairs, which were governed by traditional German diplomacy and Nazi policy. Although Hitler made him in 1934 "spiritual supervisor" of the party, he was unable to hold his own against Josef Goebbels (*q.v.*) in the field of propaganda. At the beginning of World War II he enjoyed a brief moment of glory when he brought the Norwegian Fascist, Vidkun Quisling (*q.v.*), into contact with Adm. Erich Raeder and through him with Hitler; but Hitler relied on armed force rather than on Quisling's offer of a *coup d'état* for the subjugation of Norway. After the fall of France, Rosenberg was given charge of an *Einsatzstab* responsible for the acquisition and transport to Germany of any works of art which appeared valuable to him.

In March 1941 Hitler asked Rosenberg to prepare a plan for the German administration of European Russia. On April 25 Rosenberg submitted a scheme proposing the partition of the European area of the U.S.S.R. into four *Reichskommissariate:* Ostland (including the three Baltic states) and Belorussia, Ukraine, Moscow, and Caucasus. On July 17 a *Reichsministerium* for the occupied eastern territories was formed with Rosenberg as minister, but his authority was crushed by the powers given to Heinrich Himmler

and Hermann Göring (*qq.v.*) who were placed in charge, respectively, of the security organization and the economic agencies. Against these formidable rivals he proved totally ineffective. His ineffectiveness did not, however, save him from arrest at the end of the war. He was brought to trial in Nürnberg, found guilty on all of four counts, and hanged on Oct. 16, 1946. His writings and speeches were collected under the title *Blut und Ehre,* four volumes (1934–41).

See A. Dallin, *German Rule in Russia, 1941–1945* (1957).

(W. Kp.)

ROSENBUSCH, KARL HEINRICH FERDINAND (Harry Rosenbusch) (1836–1914), German geologist who laid the foundations of the science of microscopic petrography, was born on June 24, 1836, at Einbeck, Hanover. He studied philosophy at Göttingen, and later science at Freiburg and Heidelberg, obtaining his doctorate at the former university with a dissertation on the nephelinite of the Katzenbuckel Mountain, north Baden, in 1868.

The study of the optical properties of minerals was in its infancy, and the researches of Rosenbusch were fundamental. These are enshrined in his monumental work *Mikroskopische Physiographie der Mineralien und Gesteine,* vol. i, *Die petrographisch wichtigen Mineralien* (1873) and its companion volume on the igneous rocks (1877), both classic contributions to mineralogy and petrography.

Rosenbusch was appointed professor (extraordinary) of petrography at Strassburg (Strasbourg) in 1873 and ordinary professor of mineralogy at Heidelberg in 1878, retiring in 1908. From 1888 to 1907 he also acted as director of the geological survey of Baden. At Heidelberg his laboratory became the resort of students from many countries, attracted no less by his personal qualities than by his genius and encyclopaedic knowledge. Rosenbusch died in Heidelberg on Jan. 20, 1914. (C. E. T.)

ROSENHEIM, a town of West Germany in the *Land* (state) of Bavaria (Bayern), Federal Republic of Germany. It lies 1,470 ft. (448 m.) above sea level at the confluence of the Mangfall and Inn rivers, 40 mi. (65 km.) SE of Munich by the main railway line to Salzburg, Aus., and 4 km. N of the Munich–Salzburg *Autobahn.* Pop. (1961) 31,611. It was an important trading town on the route from Italy to northern Europe since medieval times, and the Italian architectural influence is reflected in the town's many flat-roofed buildings. There is a technical school for the locally important timber industry. Other industries include a saltworks and the manufacture of folding canoes, tents, and other sports equipment. Rosenheim is a *Kreisstadt* (district town) and the seat of an *Amtsgericht* (district court).

ROSENWALD, JULIUS (1862–1932), U.S. merchant and philanthropist, who exercised a creative influence on philanthropy throughout the world. Opposed to perpetual endowments, Rosenwald inspired others by the example of his own gifts and frequently made his offers of donations in such form that they had to be matched by other gifts before they were received.

Born in Springfield, Ill., on Aug. 12, 1862, Rosenwald entered the clothing business in New York at the age of 16. In 1885, together with his brother Morris and his cousin Julius Weil, he established the clothing firm of Rosenwald & Weil in Chicago. In 1897 he became vice-president of Sears, Roebuck & Company, which grew to be the world's largest mail-order house and chain of retail stores. In 1910 he succeeded Richard W. Sears as President, a position he held until 1925, when he became chairman of the board. Rosenwald, with A. H. Loeb, treasurer of the company, was instrumental in establishing an outstanding employees' savings and profit-sharing pension fund (*see* Profit Sharing). In December 1921 he pledged from his personal fortune the sum of $21,000,000 to safeguard the interests of the company during the critical period of business readjustment after World War I.

Having amassed a large personal fortune, Rosenwald engaged in large-scale charitable and philanthropic activities. He was active in Jewish charities in Chicago and during the war donated $1,000,000 to the Jewish War Relief Fund. After the war he pledged $6,000,000 to the Joint Distribution Committee to settle the Jews of Russia in agricultural colonies. He also contributed $100,000 in 1920 for the relief of German children.

In the early 1900s Rosenwald became actively interested in the welfare of the Negro, and in 1917 he established the Julius Rosenwald Fund (with the provision that the fund be expended within 25 years of his death) to better the condition of Negroes through education. The fund, along with local tax funds and private gifts, contributed to the construction of more than 5,000 schools for Negroes in 15 Southern states. Rosenwald contributed large sums to the YMCA in an endeavour to erect buildings for Negroes in 21 cities of the U.S. He also served as a trustee of Tuskegee Institute, a normal school for Negroes.

Rosenwald donated more than $4,000,000 to the University of Chicago and gave approximately $6,600,000 to establish the Museum of Science and Industry in Chicago. He also founded dental infirmaries in the Chicago public schools. Rosenwald's gifts during his lifetime exceeded $22,000,000, exclusive of the Rosenwald Fund, which had assets worth $40,000,000 in 1928.

Rosenwald was deeply interested in the improvement of municipal and national government and was an active participant in the civic affairs of Chicago, for many years serving as chairman of the Bureau of Public Efficiency. He died in Chicago on Jan. 6, 1932. (M. R. W.; X.)

ROSENZWEIG, FRANZ (1886–1929), German-Jewish religious philosopher, whose life and writings made a deep impression on German Jewry between World Wars I and II. Lasting contributions to the study of German philosophy are his *Das älteste Systemprogramm des deutschen Idealismus* (1917) and *Hegel und der Staat,* two volumes (1920).

Born at Kassel on Dec. 25, 1886, the son of an assimilated Jewish family, he first studied medicine, then turned to history and philosophy, and later to jurisprudence. After contemplating conversion to Christianity, he decided, in 1913, to remain a Jew and to devote his life to the study and reinterpretation of Judaism. On active service in the German Army during World War I, he conducted a correspondence on Jewish and Christian theology with Eugen Rosenstock (published in *Briefe,* edited by Edith Rosenzweig, 1935) and started to write his magnum opus, *Der Stern der Erlösung* (1921; 3rd ed. 1954; "The Star of Redemption"). Although steeped in idealist thought, especially that of Schelling, he broke with its fundamentally monistic outlook and replaced it by an existential philosophy of the relationship between God, man, and the world. In 1919 he opened in Frankfurt am Main a Jewish Lehrhaus (Adult Study Centre), which was on a high academic level and inspired by a sense of religious commitment. It became the model of similar institutes throughout Germany. Afflicted in 1921 by a progressive paralysis which by 1923 had robbed him of all ability to speak, write, or move, he nevertheless managed, with the help of his wife and by using a specially fitted typewriter, to produce several important essays (collected in *Kleinere Schriften,* 1937), an annotated version of 92 poems of Judah Halevi (1927), and, with Martin Buber, a new German translation of part of the Bible (1925–38), all of which reveal his intellectual clarity and the depth of his religious insight. He died at Frankfurt on Dec. 9, 1929.

See N. N. Glatzer, *F. Rosenzweig: His Life and Thought* (1953; 2nd rev. ed. 1962), which contains a selected bibliography on pp. 377–382.

(A. An.)

ROSES, WARS OF THE, was the name given many years afterward to a series of dynastic civil wars in England, which occurred between 1455 and 1487. The name derives from the white and red roses which were respectively the badges (*i.e.,* emblems given by great lords to distinguish their retainers) of the house of York and (after 1485) of the house of Lancaster (*qq.v.*), between whom the wars were fought. The main contenders were the Lancastrian king Henry VI (d. 1471), whose cause was forcefully prosecuted by his wife Queen Margaret; Henry's first opponent Richard, duke of York (d. 1460), who, descended from Lionel of Antwerp, the third (but second surviving) son of Edward III, had a better hereditary claim to the throne (though passing twice through a woman) than Henry VI himself; York's son Edward, whose success brought him to the throne as King Edward IV (d. 1483); Edward's brother Richard III (d. 1485); and Henry

Tudor, earl of Richmond (later Henry VII), who, descended from the Beauforts, the illegitimate issue of John of Gaunt, ancestor of the Lancastrian line, claimed to be the heir of the house of Lancaster. But what made the war possible and gave it its distinctive character was the power and rivalry of the great lords, most notable among whom was Richard Neville, earl of Warwick (d. 1471), called since the 16th century "the Kingmaker."

Thus the title of the wars, although not contemporary and in a way inappropriate (since the red rose appeared only after their end in the reign of Henry VII, who created the badge in contrast to the white rose of York), is, in a deeper sense, peculiarly apt, because the rose, as one of the badges given by magnates to their retainers, symbolizes the ascendancy of the great lords of the period. The crown itself (held sometimes by the house of Lancaster and sometimes by the house of York), although surrounded, particularly at the beginning of the conflict, with an aura of divinity, appeared with regard to the resources at its disposal as little more powerful than individual magnates. Apart from the not very efficient militia, it possessed an "affinity" (*i.e.*, a vast throng of indentured adherents, comprising not only soldiers and retainers but also lawyers, clerks, knights, and other clients) of the same kind as that of the magnates who, moreover, held strongholds not markedly inferior to those of the crown. As it happened, however, strongholds played little part in the wars, except for the sieges of Northumberland castles in 1462 and 1464. England, which in the 14th century had been in the forefront of military development, was now lagging behind. Cannon rarely appeared, and the small arms used for the first time in English history at the second Battle of St. Albans (1461) proved ineffective. The weapons of the war were, in the main, the traditional bows, lances, swords, and daggers.

Although it was the power of the magnates that made the civil wars possible, the Yorkists might never have come to challenge Lancastrian supremacy but for the course of political events. Mystical reverence for an anointed king was so considerable that it took the combined effects, in Henry VI's reign, of a long and factious minority followed by the rule of a kindly but weak king, and the startling disasters in France, to shake the authority of the Lancastrian house (*see* ENGLISH HISTORY: *VII. Lancaster and York;* HENRY VI). Even when the war began, reverence for the king delayed a Yorkist claim to the crown for five years. This development of the war into a dynastic struggle was then greatly facilitated by the peculiar conjunction in the person of Richard, duke of York, of lordship of vast estates, kinship with an extremely powerful group of nobles, the Nevilles, and a strong hereditary claim to the throne.

The first battle of the Wars of the Roses took place at St. Albans in 1455, because York had become convinced that Queen Margaret and the chief minister, Edmund Beaufort, duke of Somerset, were scheming to destroy him. As in many of the battles of the war, the site was determined by the desire to capture or defend London. The encounter ended in less than an hour with the death of Somerset and the capture of the king. This ensured for a while the ascendancy of the Yorkists; but neither side trusted the other and each maneuvered to gather overwhelming forces. The war broke out again in 1459, when the Lancastrians tried at Blore Heath in Staffordshire to stop Richard Neville, earl of Salisbury, from bringing reinforcements from Yorkshire to join York's forces at Ludlow. The Yorkists won a hard-fought battle (Sept. 23, 1459) and marched on to Ludlow. Thither Henry VI himself soon came; and such was still the reluctance to fight against the king that after a skirmish at Ludford Bridge (Oct. 12) the Yorkist forces melted away and the leaders fled, York to Ireland, and his eldest son Edward, with his uncle Salisbury and his cousin the earl of Warwick, to Calais, of which Warwick was captain. Warwick with his fleet commanded the Channel; and, having the initiative, he landed with Salisbury and Edward at Sandwich on June 26, 1460, and advanced to Northampton to meet Henry VI and his army. There the Yorkists won a complete victory in half an hour and the king was captured (July 10, 1460). York now returned from Ireland and claimed the throne; and a compromise was made by which Henry was to remain king, but Richard was to succeed him. This meant the disinheritance of Henry's son, Prince Edward, and as Queen Margaret lived for him, she stirred up opposition in the country to the uttermost. York therefore had to go to Yorkshire to deal with Lancastrian defiance there; and just outside his castle near Wakefield he was surprised and killed (Dec. 30, 1460).

Lancastrian vindictiveness after the battle steeled the hearts of the surviving Yorkists. On Feb. 2, 1461, York's heir Edward defeated a Lancastrian concentration at Mortimer's Cross. Then, with the speed which helped to make him the best general of the war, he marched to London. He was just in time. After the Lancastrian success at Wakefield, Margaret had gathered a large force and advanced down the Great North Road to capture London; after crossing the River Trent she allowed unlimited pillage. Warwick advanced from London to oppose her at St. Albans; there, on Feb. 17, 1461, he was defeated and the way to London lay open. But while Margaret hesitated and parleyed with the Londoners, young Edward arrived (Feb. 26). The cruelties of Wakefield, the misdeeds of Margaret's army, and her alliances with the national enemies, the Scots and French, removed the last hesitations of the Yorkists and the Londoners, and Edward was hailed as king in Westminster Hall on March 4. Margaret and Henry retreated hastily to the north. Edward and Warwick sped after them and caught up with them at Towton, near Tadcaster in Yorkshire. There, in the bloodiest battle of the war, the Lancastrians suffered a crushing defeat (March 29, 1461). Henry, Margaret, and their son had to flee to Scotland. Margaret tried to organize resistance in Northumberland; but the last opposition of the Lancastrians was, for the time being, ended with the defeat of the Lancastrian armies at Hedgeley Moor and Hexham (April 25 and May 15, 1464), the surrender of the castles of Alnwick, Dunstanburgh, and Bamburgh (June–July 1464), and the capture of Henry VI (July 1465).

The revival of the war was occasioned by the growing rift between Edward IV (*q.v.*) and Warwick after the king's marriage (1464). After risings in the north in the summer of 1469 the forces of Warwick and Edward's rebellious brother George, duke of Clarence, defeated those of the king at Edgecote in Northamptonshire (July 25–26). The king was then captured at Olney near Kenilworth, but the reverence for the king's person which had formerly helped Henry VI now came to the rescue of Edward IV and in less than three months he had to be released. In March 1470 he received certain proof that Warwick and Clarence had stirred up a revolt in Lincolnshire; and after defeating the rebels at Losecoat Field near Stamford (March 12, 1470), he summoned Warwick and Clarence to account. They fled to France, where in their plight they accepted aid from Louis XI on his terms—reconciliation with their bitter foe, Queen Margaret. With French aid Warwick and Clarence landed in Devon on Sept. 13, 1470. Edward IV, ever too trustful in his youth, was nearly surprised by Warwick's brother, John Neville, marquess of Montagu, in whom he had always confided. He had to flee to Holland with his brother Richard, earl of Gloucester (afterward Richard III), and a few other faithful supporters; but in March 1471 he returned with Burgundian help. By his personal charm, soothing lies, and speed, he gathered forces, outmaneuvered Warwick, and gained possession of London (April 11). To defend the capital he met Warwick's forces at Barnet, where he won a complete victory (April 14, 1471); Warwick and Montagu were slain on the field. That very day Margaret and her son landed at Weymouth. On hearing the news of Barnet she wished to return to France, but her friends persuaded her that this might be her last chance, and that in Wales they might find both safety and support. It therefore became a race as to whether she or Edward could reach the Severn first; and with the advantages of interior lines and a talent for speed Edward caught up with the Lancastrians at Tewkesbury. There Margaret's force was destroyed (May 4, 1471), her son was killed, and she was captured. In the same month a Lancastrian attack on London was warded off and Henry VI was murdered; thereafter Edward IV was safe for the rest of his life.

Richard III's usurpation of the throne (1483) gave the Lancastrians an unexpected opportunity; for after the failure of the

duke of Buckingham's rebellion in October 1483, discontented Yorkists turned to the last hope of the Lancastrians, Henry Tudor. As Richard had tried to maintain English claims against France, Henry received help from the French; and with both French and English troops, about 2,000 strong, he landed in Milford Haven, probably at Mill Bay, in August 1485. Marching toward London by a roundabout route, through Shrewsbury and Lichfield, and gathering reinforcements as he went, he was met by Richard at Bosworth in Leicestershire. Richard had the larger forces, but he was fatally weakened by the treachery of the earl of Northumberland and of Lord Stanley and his brother Sir William Stanley. Fighting manfully, he was slain and his crown was picked up and offered to Henry of Richmond (Aug. 22). In 1487 an army equipped by Edward IV's sister Margaret of Burgundy and headed by Richard's nephew and heir, John de la Pole, earl of Lincoln, and by Viscount Lovell, invaded England in support of the pretender Lambert Simnel. They advanced to Stoke in Nottinghamshire before they were met by Henry's forces; the subsequent battle (June 16) bore, in its manifestations of timidity and disloyalty in the royalist ranks, much resemblance to the Battle of Bosworth. The royalist forces were, however, victorious; and although Henry was not secure from Yorkist plots for more than a decade, this turned out to be the last battle of the war.

The war resulted in a big increase in the power of the crown. The ranks of the nobility whose power had become such a menace to the crown were thinned by battle, executions, and attainders. The monarchy's crippling lack of resources was largely remedied by the acquisition of the vast estates of the houses of York and Neville, and by the confiscations and resumptions of lands, in spite of exemptions and restitutions of property to pardoned opponents. And in the coming century the vivid memory of the brutalities, disorders, and impoverishment of the civil war was to be a potent aid to the monarchy; for men would now submit to strong government, and even arbitrary oppression at times, rather than court by rebellion a revival of the Wars of the Roses. *See* also references under "Roses, Wars of The" in the Index.

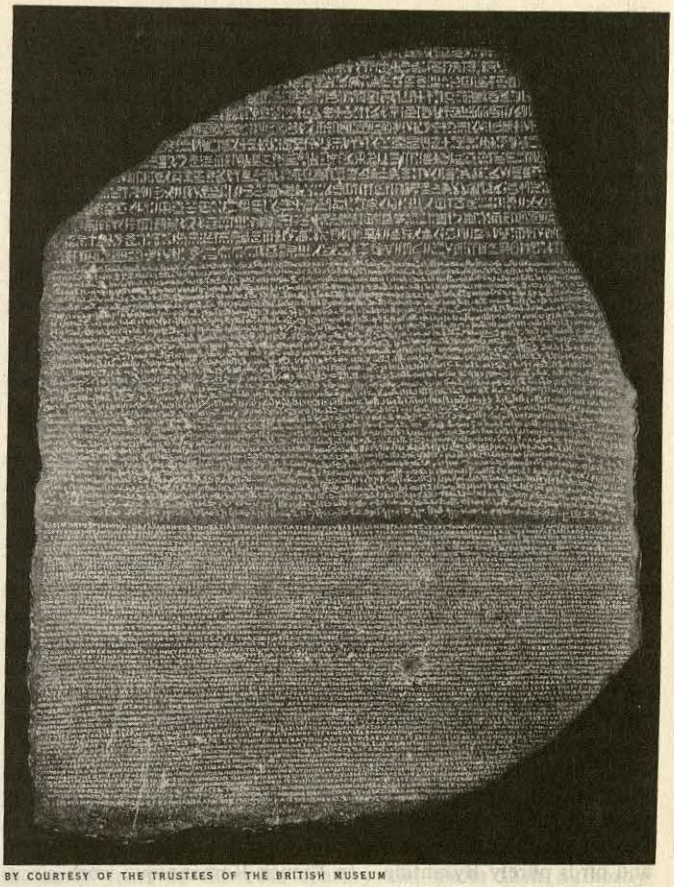
ROSETTA STONE, an ancient Egyptian stone bearing inscriptions, the deciphering of which led to the understanding of hieroglyphics. It is an irregularly shaped stone of black basalt, 3 ft. 9 in. (114 cm.) long and 2 ft. 4½ in. (71 cm.) wide, broken in antiquity, which is now in the British Museum, London. It was found near the town of Rosetta, or Rashid, on the left bank of a branch of the Nile in the western delta, about 30 mi. (48 km.) from Alexandria.

The modern town was founded by the Arab conquerors of Egypt in the 9th century A.D., when Alexandria was suffering a commercial eclipse, but after the discovery of the sea route to India, Rosetta gradually declined in importance. The inhabitants of Rosetta include many Greeks as well as Egyptians. Pop. (1960s) about 25,000.

The Rosetta stone was found in August 1799 by a Frenchman, whose name is given variously as Bouchard or Boussard, during the execution of repairs to the fort of St. Julien, and passed into British hands with the French surrender of Egypt (1801). The inscription records the commemoration of the accession of Ptolemy V Epiphanes to the throne of Egypt in the year 197–196 B.C., in the ninth year of his reign. The decree summarizes the benefactions conferred by Ptolemy upon the priesthood and appears to have been written by the priests of Memphis after a general assembly of religious leaders. The inscription is in two languages and three scripts (hieroglyphics, demotic, and Greek) and gave the key to the translation of Egyptian hieroglyphics hitherto undeciphered. The decipherment of the hieroglyphic inscription was largely



BY COURTESY OF THE TRUSTEES OF THE BRITISH MUSEUM

THE ROSETTA STONE WITH HIEROGLYPHICS IN THE TOP SECTION, DEMOTIC CHARACTERS NEXT, AND GREEK AT THE BOTTOM

the work of Thomas Young and Jean François Champollion (*qq.v.*). Young discovered that the royal names were written within ovals known as cartouches, and he worked out that foreign names, those of Ptolemy and Cleopatra, would probably be written in phonetic values which could be compared to the original group. Out of the total of 13 signs in this name he attributed the correct value to six and partially right value to three. He also discovered in 1814 the way in which the hieroglyphic signs were to be read, by examining the direction in which the birds and animals in this pictorial script faced. His main contribution to Egyptian philology was published in the *Encyclopædia Britannica* of 1824.

In 1821–22 Champollion, starting where Young had left off, published memoirs on the decipherment of hieratic and hieroglyphic and went on to establish a whole list of signs with their Greek equivalents. He was the first Egyptologist to realize that some of the signs were alphabetic, some syllabic, and some determinatives, standing for the whole idea or object previously expressed. He also established that the hieroglyphic text was the translation of the Greek, not the reverse as had been thought. The work of these two men established the basis for the translation of all future hieroglyphic texts. *See* also HIEROGLYPHS: *Decipherment.* (M. V. S.-W.)

ROSETTE, an ornament, usually circular, oval or polygonal, formed by a series of petals or leaves radiating from the centre and symmetrically placed. The form undoubtedly originated as an attempt to represent, systematically, the corolla of an open flower. Egyptian rosettes were thus, probably, representations of the open lotus. In Assyrian ornament and in the Persian work based upon it rosettes are one of the commonest ornaments and are used, by continuous repetition, to form decorative bands. Although common in archaic pottery of the Greek islands, they were little used in the developed art of Greece itself. The Romans, on the other hand, used the form lavishly and gave it great richness by employing the complex acanthus leaf as the basic radiating form. It was used not only at the centre of each face of the

Corinthian capital, but also to decorate the little panels between the modillions or the scrolled brackets of the Corinthian order and as a decoration for the centre of the coffers or sunk panels of a coffered vault or ceiling. The rosette almost went out of use in the medieval period except as it sometimes occurred as an individual flower in Gothic naturalistic ornament. In the Perpendicular period in England, the popularity of the heraldic Tudor rose gave a new importance to the rosette idea, and rosettes were frequently employed, repeated at regular intervals, to decorate hollow moldings.

Renaissance rosettes in design are based upon those of Rome, but were used even more lavishly, because of the immense development of wooden coffered and paneled ceilings.

In metalwork the idea of the rosette was probably developed independently, because of the ease with which little drops of metal could be soldered or fastened in a circle, to a basic utensil. Such rosettes, formed either of a simple circle of nearly hemispherical shape, or of one large hemisphere surrounded by several smaller ones, are favourite late Bronze and early Iron age decorations in the metalwork of the Celts, Scandinavians and the people of northern Europe generally. (T. F. H.)

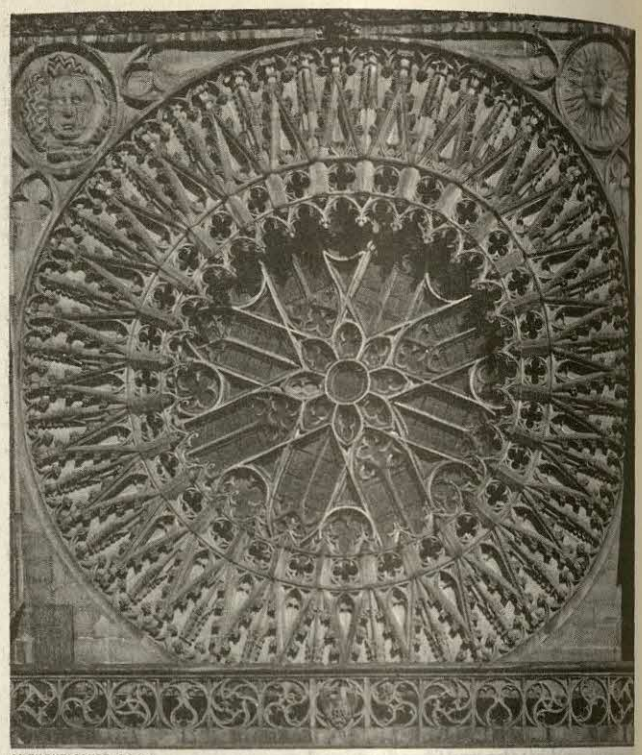
ROSE WINDOW (WHEEL WINDOW), in architecture, is a term applied to any decorated circular window. Undecorated circular windows are found in certain imperial Roman structures, used especially in the upper portions of rooms or pierced through vaults, as in the tomb of the time of Hadrian known as the Casale dei Pazzi, near Rome, but structural decoration of such forms was apparently not attempted until the Byzantine and Romanesque periods.

One of the earliest decorated circular windows extant is that of the Italian Romanesque church of S. Maria in Pomposa, possibly as early as the 10th century, in which the decoration consists of a pierced marble slab of great richness, with a design of interlaces and birds purely Byzantine. In French Romanesque work circular windows also appear, but in the earlier work, such as the late 11th-century apse of S. Sernin at Toulouse, they are undecorated, like those of the Roman empire. Meanwhile, in Mohammedan work, the cusped circle had been a common form, usually, however, not as a window, but as the outer boundary of a sunk hemisphere, as in the mosque of Ibn Touloun at Cairo, Egy. (876–878).

The crusaders probably saw many examples of such forms; in any case it is only after the earlier crusades and especially toward the middle of the 12th century that the idea of making a rich decorative motive out of a round window appeared. From then on the simple rose window became more and more common, and was, in fact, a distinguishing characteristic of many transitional and early Gothic cathedrals. It was particularly used at the west end of the nave and the ends of the transepts. An exceptional early use is the round window which lighted the triforium roof space from the nave in the original form of Notre Dame at Paris (before 1177). In the west front of Laon cathedral (completed prior to 1200) there is an enormous rose window with 12 semicircles around the edge and the central foiled and cusped circle separated from the apexes of these semicircles by a considerable distance, the connection between being made by little radiating colonnettes like spokes. This window is remarkably advanced for its date, as the filling, like that of the Paris triforium, is essentially bar tracery. The rose window of the west front of Chartres cathedral (1194–1212) consists, on the other hand, of plate tracery, the circle being filled with a thin plate of stone, through which are pierced many small foiled or cusped holes.

A similar form of plate tracery within a circle is used to cap the twin windows of the clerestory bays.

The introduction of developed bar tracery gave a compelling impetus to rose window design. The general scheme consisted of a series of radiating forms, each of which was tipped by a pointed arch at the outside of the circle. The bars between these forms were joined at the centre by a pierced circle of stone and the forms themselves frequently treated like little traceried windows with subsidiary, subdividing bars, archs and foiled circles. The most beautiful examples of this type are those of the west front of Reims cathedral (end of the 13th century) and the transepts of



AUTHENTICATED NEWS

THE ROSE WINDOW (1350), 30 FT. IN DIAMETER, ABOVE THE WEST PORTAL OF ST. LORENZKIRCHE, NÜRNBERG, GERMANY

Reims, Amiens and Notre Dame at Paris (all of the last half of the 13th century). The introduction of the wavy lines of Flamboyant tracery completely changed the character of French rose windows, but they continued basically radiating in design. The radiating elements consisted of an intricate network of wavy, double curved bars, creating all sorts of interesting circles and flame shapes and, incidentally, furnishing a diagonal bracing to the whole composition which added materially to its structural strength. The rose at the end of the transept at Beauvais (early 16th century) is characteristic.

The influence of the French rose windows was widespread from an early period. Variations of the form appear in a multitude of late Italian Romanesque churches, as in the widely varying type in the late 12th century west front of S. Pietro in Toscanella, and the more normal example in S. Zeno at Verona (late 12th century). In England the rose window has never been so popular as in France. Those in the transepts of Westminster abbey are more characteristically French than English. The most typically English examples are in the transepts of Lincoln cathedral; that on the north from the Early English period is a remarkably delicate example of plate tracery; that on the south from the Curvilinear period of the early 14th century is striking because it is not radiating in design, and therefore completely at odds with the French prototypes.

ROSEWOOD, the name given to several distinct kinds of ornamental timber, products of various tropical trees native to Brazil, Honduras, Jamaica, Africa and India. The most important commercially are the Brazilian rosewood, principally *Dalbergia nigra,* a leguminous tree of large dimensions, called *cabiúna* and jacaranda by the Brazilians—and the Honduras rosewood, *D. stevensoni.* The term jacaranda is also applied to several species of *Machaerium,* also trees of the family Leguminosae; some of the rosewood of commerce is drawn from these sources.

Rosewood earlier was exported in large quantities from Rio de Janeiro, Bahia, Jamaica and Honduras. The heartwood attains large dimensions, but as it begins to decay before the tree arrives at maturity it is always faulty and hollow in the centre; therefore, squared logs or planks of rosewood are never seen, the wood being imported in half-round flitches 10 to 20 ft. in length and

from 5 to 12 in. in their thickest part. Rosewood, a deep ruddy-brown to purplish-brown in colour, richly streaked and grained with black resinous layers, takes a fine polish, but because of its resinous nature is somewhat difficult to work. The wood, once much in demand by cabinetmakers and piano makers, is still used to fashion xylophone bars, but waning supplies now restrict its use in the U.S. to the making of carpenters' spirit levels, plane handles and brush backs. ROSH HA-SHANA: *see* Jewish Holidays.

ROSICRUCIANISM. There are Rosicrucian societies, fraternities, orders, fellowships or lodges in most countries of the modern world. Some of them are very active; others are obscure and highly secret; some seem to be primarily religious in their emphasis, and some categorically deny that Rosicrucianism is a religion, holding rather that it is a philosophy, making use of the most modern scientific methods and techniques, as well as the methods of the occultist, the mystic and the seer, in the quest for truth.

But, while Rosicrucianism is sectarian in character and the various branches are sometimes bitterly critical of each other, they do have common features, the central one being the purported possession of certain secret wisdom handed down from ancient times, through a secret brotherhood, an esoteric wisdom that can only be imparted to the initiated.

Their teachings so far as known seem to combine something of Egyptian Hermetism, Christian Gnosticism, Jewish cabalism, alchemy and a variety of other occult beliefs and practices. While alchemy seems to have been prominent in the movement, modern Rosicrucians affirm that their language must be taken symbolically rather than literally and that they have no interest in such things as the transmutation of metals.

Whether all Rosicrucian organizations can trace their origins back to the main historic stream of Rosicrucianism is a matter of grave doubt. But after all, what is the true Rosicrucianism?

The earliest extant writing which unequivocally mentions a Rosicrucian order appeared in the early 17th century. But even here the actual existence of such an order cannot be affirmed absolutely. Indeed, not a few scholars believe rather that the order had its rise from the publication of this document and that it was written with this definite purpose in mind.

The document was the famous *Fama Fraternitatis,* first published in 1614 but probably circulated in manuscript form somewhat earlier than this. Seven editions appeared during the years 1614–17. It recounts the journey of the reputed founder of the movement, Christian Rosenkreuz, to Damascus, Damcar in Arabia, Egypt and Fès, where he was well received and came into possession of much secret wisdom. He returned finally to Germany, where he chose three others to whom he imparted this wisdom and thus founded the order. Later the number was increased to eight who separated, each going to a separate country.

One of the six articles of agreement they adopted was that the fraternity should remain secret for 100 years. At the end of 120 years the secret burial place and the perfectly preserved body of the founder were discovered by one of the then members of the order, along with certain documents and symbols held in very high esteem by Rosicrucians. The sacred vault was re-covered, the members of the order dispersed, and no one knows its location. The *Fama* ends with an invitation to "some few" to join the fraternity.

According to the *Confessio,* which is bound up with the *Fama* in some of the editions, Christian Rosenkreuz was born in 1378 and lived 106 years, or until 1484. His tomb was then hidden for 120 years, making its discovery fall in 1604. If this is a true account of the founding of the order, it must have come into being sometime in the 15th century.

Some regard the story as a statement of fact and hold Christian Rosenkreuz to have been the founder of the order. More generally it is held to be a mythical explanation of the order and Christian Rosenkreuz not a real person at all, but a symbolic character. R. Swinburne Clymer saw in the travels of Christian Rosenkreuz in the *Fama* an obvious parallel to the travels of Paracelsus, whom he regarded as the real founder of the movement.

H. Spencer Lewis held that it marks only a revival of the order which began in remote antiquity in Egypt, where the great Ikhnaton made significant contributions to it. He listed numerous persons of antiquity, including Solomon, Jesus, Plato, Philo, Plotinus and others, as well as movements such as the Essenes of Jesus' day, the young Christian movement itself and later movements such as Jewish cabalism, as related to the ancient order. These he identified as truly Rosicrucian because he was able to find among their reported teachings ideas which he regarded as Rosicrucian. His conclusions do not seem convincing to objective students. There can be no doubt that there were in ancient times persons whose outlook and thought were similar to that of the Rosicrucians. That there was a continuing order in existence previous to the 15th century or even the 17th is impossible to prove beyond question, on the basis of any sources available to non-Rosicrucian research.

With the publication of the *Fama,* international interest in the order was aroused and it was not long before there were Rosicrucian orders in several European countries. Michael Maier, a learned alchemist, became its chief exponent in Germany. Robert Fludd is thought to have introduced it into England. Thomas Vaughan translated the *Fama* into English in 1652, and though he knew of no existing order in England at that time he remarked that he was not unacquainted with Rosicrucian doctrine and had no doubt concerning the existence of the order.

That it is not always possible to prove the existence of the order in a given country at any particular moment does not disturb the Rosicrucians, for it seems to be recognized that there occur periods when the order is deliberately "in sleep." H. Spencer Lewis reduced these periods to a definite rhythm of 108 years of activity followed by 108 years of silence, in a given country. It was in accordance with this cyclic theory, he said, that he was led at the proper time to seek out the leaders of the order in France in the early years of the 20th century and under their authority to inaugurate a new cycle of activity in the United States in 1915, under the name Ancient Mystical Order Rosae Crucis, usually abbreviated to A.M.O.R.C. It became affiliated with the Fédération Universelle des Ordres et Sociétés Initiatiques, established in Europe in 1934.

R. Swinburne Clymer, head of a rival U.S. order with headquarters at Quakertown, Pa., who as early as 1902 published *The Rosicrucians: Their Teachings,* spoke of the periods of silence, but these were determined by specific conditions rather than by the passage of time. His organization, traced through a definite line of Rosicrucian adepts in the U.S. from revolutionary times, with Paschal Beverly Randolph and Freeman B. Dowd as his more immediate predecessors, is known as the Fraternitas Rosae Crucis. Its foreign affiliation was with La Fédération Universelle des Ordres, Sociétés et Fraternités des Initiés.

Rosicrucianism and Freemasonry have not a little in common. Indeed, there is a degree in masonry known as the Rose Croix degree. Likewise, the *Societas Rosicruciana in Anglia* and its affiliates are held to be more masonic than Rosicrucian.

The symbol of Rosicrucianism is a combination of the cross and the rose, from which the order takes its name. The origin of the symbol is variously given, but there seems to be no one explanation which is completely satisfactory.

(C. S. B.)

ROSIN (Colophony), the resinous constituent of the oleoresin exuded by various species of pine, known in commerce as crude turpentine. The separation of the oleoresin into the essential oil spirit of turpentine and common rosin is effected by distillation in large stills. Rosin (a later variant of "resin," *q.v.*), varies in colour, according to the age of the tree from which the

turpentine is drawn and the amount of heat applied in distillation, from an opaque almost pitchy black substance through grades of brown and yellow to an almost perfectly transparent colourless glassy mass. The commercial grades are numerous, ranging by letters from A, the darkest, to N, extra pale, and X, most pale, W (window glass) and WW (water white) varieties, the latter having about three times the value of the common qualities.

Rosin is a brittle and friable resin, with a faint pinelike odour; the melting point varies with different specimens, some being semifluid at the temperature of boiling water, while others do not melt till 220° F. or 250° F. It is soluble in alcohol, ether, benzene and chloroform. In addition to its extensive use in soapmaking, rosin is largely employed in making inferior varnishes, sealing wax, various cements and as a sizing agent in the manufacture of paper. It is also used for preparing shoemakers' wax, as a flux for soldering metals, for pitching lager beer casks, for rosining the bows of musical instruments, etc. In pharmacy it forms an ingredient in several plasters and ointments.

The chief region of rosin production is the south Atlantic and eastern gulf states of the United States. American rosin is obtained from the turpentine of the swamp pine, *Pinus palustris,* and of the loblolly pine, *P. taeda.* The main source of supply in Europe is the "landes" of the *départements* of Gironde and Landes in France, where the cluster pine, *P. pinaster,* is extensively cultivated.

In the north of Europe rosin is obtained from the Scotch fir, *P. sylvestris,* and throughout European countries local supplies are obtained from other species of pine.

See also TURPENTINE.

ROSKILDE, a town of Denmark on the island of Sjælland (Zealand), in the *amt* of København (county of Copenhagen). It lies at the head of the Roskilde Fjord, 30 km. (19 mi.) W of Copenhagen by road and rail. Pop. (1960) 31,928. Throughout the Middle Ages it was Denmark's most important episcopal seat, and often a royal residence. The town is dominated by its partly Romanesque, partly Gothic cathedral of red brick with verdigris-green copper roof and slender spires. Built on the site of three earlier churches (the first founded *c.* 960 in Viking times by Harald Blaatand or Bluetooth, first Christian king of Denmark), it was begun *c.* 1170 under the direction of Archbishop Absalon (*q.v.*). It is the royal mausoleum, in which lie buried 37 kings and queens of Denmark, including 15 in unbroken succession from the Reformation to the mid-20th century. Roskilde is the largest railway junction and traffic centre on Sjælland. Proximity to Copenhagen has encouraged suburban development. There are tanneries, distilleries, and bacon factories, as well as a meat research institute. On Risö Island (6 km. N) is the Danish atomic research station. (A. FG.)

ROSMEAD, HERCULES GEORGE ROBERT ROBINSON, 1ST BARON (1824–1897), British colonial governor, high commissioner in South Africa, 1880–89 and 1895–97, was born on Dec. 19, 1824, the son of Adm. Hercules Robinson. After a brief army career he occupied certain civil service posts connected with the administration of Ireland, being especially concerned with relief measures during the famine of 1848. Robinson's first colonial appointment was as president of Montserrat in the West Indies in 1854. In the following year he was promoted to be lieutenant governor of St. Kitts, where he introduced and organized the immigration of coolie labour from India. He was knighted in 1859, and, after administering Hong Kong between 1859 and 1865, was appointed governor of Ceylon. There he was called upon to handle a serious financial and constitutional crisis and his vigorous promotion of public works, more especially road building and irrigation projects, did much to placate the colonial inhabitants. In 1872 he was made governor of the self-governing colony of New South Wales and was employed from 1874 to 1875 on special service in connection with the cession of the Fiji Islands to Great Britain.

After a brief term as governor of New Zealand (1879–80), he went to South Africa in January 1881 as governor of the Cape Colony and as high commissioner in South Africa. His arrival coincided with the war between the Transvaal and Great Britain (*see* TRANSVAAL: *History*). The Pretoria Convention of August 1881 did not remove the grievances of the Transvaal Boers, and when a Boer deputation went to England in 1883 to obtain a revision of the terms, Robinson was summoned to London for the deliberations which led to the London Convention of February 1884. Robinson was sympathetic to the fears of Cecil John Rhodes, who had entered Cape politics in 1881, that British expansion into Bechuanaland, the road to the north, might be blocked by cooperation between the Transvaal Boers and the Germans who had established a protectorate over South West Africa in 1884. Following the dispatch of an expeditionary force under Sir Charles Warren to Bechuanaland, Britain annexed the territory in 1885.

When Robinson discovered early in 1887 that the Transvaal Boers were attempting to gain special privileges from Lobengula, the chief of the Matabele, in his territory north of the Limpopo River (now Rhodesia), he sent the Rev. J. S. Moffat to Matabeleland as British resident. Though Robinson refused to commit the British government more definitely in this region, he gave his blessing to the Moffat treaty (February 1888), which gave Britain a virtual option on Matabeleland, and to the Rudd mineral concession, which became the basis of the operations of Rhodes's British South Africa Company chartered in 1889.

Robinson resigned in 1889 and left the Cape for England in May. His last public utterance on this occasion, in which he declared that there was "no permanent place in South Africa for direct imperial rule," reveals him as a much less fervent imperialist than his successor Sir Henry (later Baron) Loch. Robinson was called out of retirement by Lord Rosebery's government in May 1895 to resume his previous post in South Africa. To Rhodes, now prime minister of the Cape, a pliant Robinson, over 70 years old and in ill health, was far more acceptable than Loch had been. Interest in his second term of office centred in the fact that Robinson was high commissioner at the time of L. S. Jameson's raid (December 1895). Immediately he was informed of Jameson's rash invasion of the Transvaal, Robinson tried to check the raiders by telegraph. He subsequently declared that he had no foreknowledge of the plans for the raid, but modern historical research does not support this claim, and it was perhaps fortunate for him that medical opinion as to the state of his health prevented his subsequent examination on this question in England, where he went on leave in May 1896. He was raised to the peerage as Baron Rosmead in August. After returning to the Cape for a brief period, he finally left South Africa in April 1897 and died in London on Oct. 28, 1897. (L. M. Y.)

ROSMINI-SERBATI, ANTONIO (1797–1855), Italian priest and philosopher, the founder of the Institute of Charity, was born at Rovereto on March 24, 1797. He studied theology at the University of Padua and was ordained priest in 1821. Through his friendship with Niccolo Tommasseo and Alessandro Manzoni and a lifelong concern to reconcile his deep Catholic faith with modern political and scientific thought, Rosmini exerted a considerable influence on the Italian Risorgimento. His dissatisfaction with the spiritual and educational state of the church of his time led him, in 1828, to found the Institute of Charity at Monte Calvario, Domodossola, which was approved by Pope Gregory XVI in 1839. Modeled on the Jesuit rule, it aims at the perfection of its members through the exercise of charity in any form or field, combined with absolute devotion to the church and to one's superiors in the society.

Rosmini's *Nuovo saggio sull' origine delle idee* (Eng. trans., *New Essay on the Origin of Ideas,* 3 vol., 1883) and *Massime di perfezione* (Eng. trans., *Maxims of Christian Perfection,* 1889, 1949), which contain the essence of his philosophical and religious thought, were published in Rome in 1830; later works were *Teodicea* (1845; Eng. trans., *Theodicy,* 3 vol., 1912) and *Psicologia* (1850; Eng. trans., *Psychology,* 3 vol., 1884–88). The centre of his philosophical system, which he developed also in education and in law, is ideal being, which is not an idea like other ideas but a reflection of God in man, appertaining in eternal truth, the indispensable means of acquiring, through the senses, all other knowledge. Ideal being is the supreme criterion of

truth and certainty in logic and the basis of the concept of the dignity of the human person in law and politics. The synthetic character of Rosmini's system of human knowledge has made its assimilation difficult and led, falsely, to charges of "ontologism" and "pantheism."

Rosmini welcomed the Italian national movement, but was strongly critical of its anticlerical and anti-Catholic tendencies. Looking to the papacy for spiritual and political leadership, he published, in 1848, *Delle cinque piaghe della santa Chiesa* (Eng. trans., *Of the Five Wounds of the Holy Church*, 1883) and *La Costituzione secondo la giustizia sociale*. Both works were placed on the Index in 1849. As the Piedmontese government's special envoy in 1848–49, Rosmini was commissioned to negotiate a concordat with Pope Pius IX (*see* his narrative *Della missione a Roma . . . negli anni 1848–49*, 1881); and when the Roman revolution broke out and Pius had to escape to Gaeta, Rosmini, whose counsels he wished to reward with the cardinal's hat, accompanied him into exile. But Rosmini's influence declined under the impact of the Austrian victories in Italy and the pope's rejection of liberal reforms. Compelled by polemics and attacks on Rosmini's doctrines, Pius ordered an examination of all his works. Rosmini at once declared his submission and retired to Stresa where he died, broken in health, on July 1, 1855.

Before his death Rosmini learned that his works had been proclaimed free from censure by the Congregation of the Index (decree *Dimittantur*, 1854); Leo XIII's decree *Post obitum* in 1887 declared 40 propositions from his books to be "not seemingly consonant with Catholic truth"; but this mild form of censure was later regarded as not having theological significance (*see* U. Honan, *II Decreto Post Obitum*, Domodossola, 1949).

The Institute of Charity was established in England by Father Luigi Gentili in 1835 and contributed through its missionary activities to the Catholic revival there. By the middle of the 20th century there were Rosminian foundations in Europe, the British Isles, the U.S. and Africa.

BIBLIOGRAPHY.—*Edizione Nazionale* of Rosmini's works (1934–) was planned to comprise 100 vol. *See* also his *Letters chiefly on Religious Subjects*, Eng. trans. (1901); G. B. Pagani, *The Life of Antonio Rosmini-Serbati*, Eng. trans. (1907); C. R. Leetham, *Rosmini, Priest, Philosopher, Patriot* (1957); and the periodical *Rivista Rosminiana* (Domodossola). (R. J. H.)

ROSS, EDWARD ALSWORTH (1866–1951), U.S. sociologist and a prolific writer whose flair for popular presentation did much to stimulate interest in problems of social research, was born Dec. 12, 1866, in Virden, Ill. After studying at Coe College, Cedar Rapids, Ia., the University of Berlin, and Johns Hopkins University, Baltimore, Md. (Ph.D., 1891), he taught economics for brief periods at Indiana, Cornell, and Stanford universities. At the last-named institution, beginning in 1895, he centred his attention on sociology. Resigning from Stanford in 1900 in a dispute concerning academic freedom, he spent a few years at the University of Nebraska, Lincoln, before joining the faculty of the University of Wisconsin, Madison, where he taught sociology for 30 years.

Ross died on July 22, 1951, in Madison.

He was an early major systematizer of sociology; one of his principal contributions lay in creating a comprehensive body of theory. His best-known work, *Social Control* (1901), was long regarded as a classic, and his *Social Psychology* (1908) was one of the first American works written specifically on that discipline. Among his other works are *Foundations of Sociology* (1905); *Sin and Society* (1907); *Russia in Upheaval* (1918); *World Drift* (1928); *New-Age Sociology* (1940).

See also SOCIOLOGY: *19th-Century Influences*. (P. B. G.)

ROSS, HAROLD WALLACE (1892–1951), a revolutionary figure in U.S. journalism, founder and first editor of *The New Yorker*, was born in Aspen, Colo., Nov. 6, 1892. He quit high school to become a reporter, and in World War I edited *Stars and Stripes*, the serviceman's newspaper, in France. When he launched *The New Yorker* in 1925 he quickly toppled many conventional literary forms in his quest for ways to capture the contemporary scene in the magazine's pages.

Young new writers and artists, attracted by the rich odour of innovation, were drawn to the magazine. Under Ross's guidance, satire and parody flourished, reporting became lighthearted and searching, humour was allowed to infect everything, biography achieved bold strokes in the "Profiles," the short story enjoyed a reprieve from the heavy burden of plot, and social cartooning became less diagrammatic and more vigorous. In *The New Yorker*, the unknown writer was on equal footing with the established one; the editor sought good writing, not great names. Restless, noisy, consumed by curiosity, driven by a passion for clarity and perfection, Ross spent himself recklessly on each succeeding issue, and with unabating discontent.

Ross died in Boston on Dec. 6, 1951, having to a notable extent changed the face of journalism in his time. (E. B. W.)

ROSS, SIR JAMES CLARK (1800–1862), British rear admiral and polar explorer, who carried out important arctic and antarctic magnetic surveys, was born in London on April 15, 1800. He entered the Royal Navy in 1812, accompanying his uncle, Capt. (later Sir) John Ross (*q.v.*), on his first arctic voyage in 1818. Between 1819 and 1827 he accompanied Sir W. E. Parry on his four arctic expeditions, and from 1829 to 1833 again accompanied his uncle, reaching the north magnetic pole in 1831. From 1835–38 he worked on the magnetic survey of Great Britain, except from Dec. 1835 to Aug. 1836 when he searched for some missing arctic whaling ships (*see* "Polar Record," no. 40, 1950). He commanded H.M.S. "Erebus" and "Terror" during the antarctic expedition of 1839–43, sailing to Hobart and thence to the antarctic. The ships penetrated the pack ice from Jan. 5 to 10, 1841, in long. 174° E., reaching open water and discovering the Ross sea. The expedition's main object was to conduct magnetic observations in the antarctic and to reach the south magnetic pole. The ships sailed south toward the position assigned by K. F. Gauss to the pole, meanwhile discovering Victoria Land. Progress further south was barred by the Ross ice shelf, along which the ships coasted to long. 167° W. Unable to find suitable winter quarters, Ross returned to Hobart. In Nov. 1841 he sailed south to the barrier from New Zealand, reaching lat. 70° 10′ S. in 161° 27′ W., probably also sighting Edward VII peninsula. The ships wintered in the Falkland Islands and returned south to chart part of Graham coast. They sailed east along the edge of the Weddell sea ice and south to lat. 71° 30′ S., long. 14° 51′ W. On the way home Ross tried unsuccessfully to rediscover Bouvetøya (lat. 54° 26′ S., long. 3° 24′ E.). His *Voyage of discovery . . . in the Southern and Antarctic Regions* appeared in 1847. He was elected a fellow of the Royal society in 1848. From 1848 to 1849 he searched for Sir John Franklin in H.M.S. "Enterprise" and "Investigator."

He died at Aylesbury on April 3, 1862.

ROSS, SIR JOHN (1777–1856), Scottish rear admiral and arctic explorer, whose second arctic expedition in search of a northwest passage made important contributions to oceanography, was born on June 24, 1777, at Balsarroch near Stranraer, Wigtownshire, Scot. He entered the Royal Navy in 1786 and fought in the French Revolutionary and Napoleonic wars, during which he captained the Swedish fleet. In 1818 he made his first arctic expedition on which he failed to discover much that was new; but in 1829–33 he made a second, surveying Boothia peninsula, King William Land and the Gulf of Boothia, and achieved important results. In 1850 he undertook a third voyage in unsuccessful search of Sir John Franklin and in 1851 he became a rear admiral. Ross died in London on Aug. 30, 1856.

His publications include *A Voyage of Discovery . . . for the Purpose of Exploring Baffin's Bay . . .* (1819); *Narrative of a Second Voyage in Search of a North-West Passage* (1835); *Memoirs and Correspondence of Admiral Lord de Saumerez* (1838).

ROSS, JOHN (Indian name KOOWESKOOWE or COOWESCOOWE) (1790–1866), famed chief of the Cherokee Indians, the ablest leader of his people for almost 40 crucial years, was born near Lookout Mountain, Tenn., on Oct. 3, 1790. Ross's blue eyes and brown hair indicated that his Cherokee strain was small. His father, a Scottish trader, employed a tutor and later sent Ross to

an academy at Kingston, Tenn. In 1813 he married a full-blooded Cherokee woman named Quatie. Some years after her death he married Mary Bryan Stapler, a white woman of Quaker faith.

During the early part of the 19th century there developed considerable pressure to open the Indian lands in Georgia to white settlement (*see* GEORGIA: *History*) and Ross became leader of the Cherokees opposed to westward removal. From 1819 to 1826 he served as president of the National Council of the Cherokees. His leadership was strengthened when, in 1823, he exposed machinations of federal commissioners who attempted to bribe him into approving Cherokee land sales. In 1828 he became head chief of the eastern Cherokees under a new constitution he had helped write. His valorous defense of Cherokee freedom and property from land-hungry Georgians utilized every means short of war and included several appeals to the federal government. After all efforts had failed, in 1838–39 Ross led his people to their new home in what is now Oklahoma. There he helped write the constitution of 1839, uniting the eastern and western Cherokees under one government, and was chosen chief of the united tribe. He held this office until his death on Aug. 1, 1866, in Washington, D.C., where he had gone to assist in making the Cherokee treaty of 1866.

See Chapman J. Milling, *Red Carolinians* (1940), which includes an authoritative account of the Cherokee removal and Ross's leadership; with bibliography. (W. R. J.)

ROSS, SIR RONALD (1857–1932), British bacteriologist and Nobel laureate, noted for his investigations of malaria, was born at Almora, India, on May 13, 1857. He studied medicine at St. Bartholomew's Hospital, London, and in 1881 entered the Indian Medical Service. In 1892 he began a series of investigations on the subject of malaria (*q.v.*), in 1895 undertook to verify experimentally the theory that the microorganisms of this disease are spread by mosquitoes and in 1897–98 investigated the life history of the parasites. In 1899 he retired from the Indian medical service, and, after a journey to West Africa in 1899 for the study of malaria-bearing mosquitoes, devoted himself to research and teaching, joining the Liverpool School of Tropical Medicine as lecturer and subsequently becoming professor of tropical medicine at the University of Liverpool. In 1913 he became physician for tropical diseases at King's College Hospital, London, and later director in chief of the Ross Institute and Hospital for Tropical Diseases. During World War I Ross was war office consultant in malaria and after the war acted as consultant in malaria for the ministry of pensions. In 1902 he received the Nobel Prize for Medicine; in 1911 he was created knight commander of the Bath; and in 1918 a knight commander of St. Michael and St. George. He received the royal medal of the Royal Society, of which he was a fellow, in 1901. He died Sept. 16, 1932.

Ross was editor of *Science Progress*, and the author of *The Prevention of Malaria* (1910); *Philosophies* (1910); *Psychologies* (1919); *The Revels of Orsera*, a romance (1920); and *Memoirs* (1923), as well as mathematical and medical works.

See *British Medical Journal*, 2:609 (1932).

ROSS AND CROMARTY, a northern county of Scotland, and the third largest, with an area of 3,089.5 sq.mi., spans the entire width of the country from the North Sea to the Atlantic and includes the island of Lewis with numerous small offshore islets, mainly uninhabited. The boundary with Sutherland on the north is formed mainly by the Oykell River; the boundary with Inverness in the south is formed by a mountain rampart which separates the Conon drainage from that of the Great Glen and Beauly Firth. The county fans out from the productive Moray Firth lowlands in the east, segmented by the Dornoch, Cromarty, and Beauly firths, westward through mountain country of increasing grandeur to the long Atlantic coastline, indented by a dozen or more sea lochs and bays.

Physical Features.—The bulk of the county comprises the northwestern Highlands, a dissected plateau with recognizable surfaces at 1,000 (305 m.), 2,000, and 3,000 ft., and many peaks above 3,000 ft., more isolated in the west by the greater erosion attendant on higher precipitation. The east-west watershed is never more than 15 mi. from the west coast, so streams are short and turbulent and glens are narrow in contrast to the wider straths (Conon, Bran) opening to the east. Rock structure is closely related to landscape. The oldest rocks are the Lewisian gneiss, the remnants of an ancient Archean land surface, which form low hummocky expanses of bare rock in Lewis itself and on the mainland between Loch Maree and Little Loch Broom; overlying these and east of them are the massive Torridonian sandstones sweeping northeastward from Loch Carron to Enard Bay in a 10 to 15 mi. (6 to 9 km.) belt and perhaps best represented in the Applecross Peninsula. The stepped hill slopes are sometimes dramatically capped with glittering outliers of Cambrian quartzite. A narrow belt of limestone separates the Torridonian rocks from the Moine schists which make up the bulk of the centre of the highland area where the topography is less rugged. In turn they are overlapped by rocks of Old Red Sandstone age about 15 mi. from the east coast. In general these give lower country, but it varies according to lithology; thus resistant breccias form the Mulbuie Hills in the Black Isle (actually the peninsula between Cromarty and Beauly firths).

The southwest-northeast Caledonian trend predominates throughout the county and is particularly noticeable in the coastline from Tarbat Ness to Inverness; the Alpine orogeny, however, created right-angled lines of weakness, some filled with Tertiary basaltic dikes, many subsequently etched out by ice and rivers. Glaciation, in addition, scoured soil from large areas, carved U-shaped valleys with stepped profiles, and dumped moraine on the low ground; outwash material forms a notable area of alternating gravelly ridges and ill-drained lowland between Beauly and Dingwall. Postglacial uplift has resulted in river terraces and, more importantly in this area, raised beaches at 15, 25, and 50 ft. around the eastern firths and the more sheltered western lochs (especially Loch Broom); they have their maximum extent on the northern shore of Cromarty Firth.

There is a clear distinction between the moist equable climate of the west and the drier more extreme climate of the east: Stornoway has a mean annual range of 15° F (8.3° C), Strathpeffer 19° F (10.6° C). Relief affects rainfall which reaches 90 in. (2,300 mm.) annually in the western mountains and drops below 25 in. around the Moray Firth; in addition there are wide local variations in temperature and rainfall, even from one glen to another. Snow lies less than five days in the west; from 10 to 20 in. falls in the east, and up to 100 in. in the mountains.

Glacial scouring, hard rock, and excessive rainfall have produced poor acid soils over much of the area; drainage is the main problem in making use of the boulder clay and alluvial soils in the valleys. Lighter soils develop from the Old Red Sandstone rocks, and the raised beaches give warm dry soils of considerable value in barley growing.

A large area (10,507 ac.) southwest of Loch Maree forms the Beinn Eighe National Nature Reserve. Inverpolly National Nature Reserve (created 1961), near the northwest coast, covers 26,827 ac. of wild country with ancient woodlands and the striking mountain of Stack Polly (2,009 ft.). The small reserve (202 ac.) of Rassal Ashwood is near Kinlochewe.

The estate of Kintail, which belongs to the National Trust, includes the Five Sisters, five peaks that overlook Glenshiel to the south. The trust also owns an adjoining estate in which are the spectacular Falls of Glomach and the gardens at Inverewe. Kyle of Lochalsh is the end of one branch of the "Road to the Isles," and it is also known as the "Gateway to Skye."

(A. M. LE.; A. T. A. L.)

History and Antiquities.—During the first five centuries A.D., and for long afterward, the land was occupied by Gaelic Picts, who in the 6th and 7th centuries were converted to Christianity by followers of St. Columba. Throughout the next three centuries the natives were continually harassed by Norse pirates, of whose presence tokens have survived in several place-names such as Dingwall and Tain. At that time the county formed part of the great province of Moray. The rule of the Celtic *mormaors*, or earls, ceased in the 12th century, consequent on the plantation of the district with settlers from other parts (including a body of Flem-

ings) by order of David I, who was anxious to break the power of the Celts; at this time the bounds of the principality of Moravia were contracted and the earldom of Ross arose. At first Ross proper included only the territory adjoining Moray and Dornoch firths. The first earl was Malcolm MacHeth, who received the title from Malcolm IV. After his rebellion in 1179 chronic insurrection ensued, which was quelled by Alexander II, who bestowed the earldom on Farquhar Macintaggart, then abbot of Applecross, and in that capacity lord of the western district. William, 4th earl, was present with his clan at the Battle of Bannockburn (1314). Almost a century later (1412) the Castle of Dingwall, the chief seat on the mainland of Donald, lord of the Isles, was captured after the disastrous fight at Harlaw in Aberdeen County, which Donald had provoked when his claim to the earldom was rejected. The earldom reverted to the crown in 1424, but James I soon afterward restored it to the heiress of the line, the mother of Alexander MacDonald, 3rd lord of the Isles, who then became 11th earl. In consequence of the treason of John MacDonald, 4th and last lord of the Isles and 12th earl of Ross, however, the earldom was again vested in the crown (1476). Five years later James III bestowed it on his second son, James Stewart, whom he also created duke of Ross in 1488. By the 16th century the whole area of the county was occupied by different clans: the Rosses, Munroes, Macleods, Macdonalds, and Mackenzies. The county of Ross was constituted in 1661, and Cromarty in 1685 and 1698, both being consolidated into the present county in 1889. Apart from occasional conflicts between rival clans, the only battles in the shire were those of Invercarron (1650), when Montrose was crushed by Col. Archibald Strachan, and Glenshiel (1719), when the Jacobites, under the earl of Seaforth and aided by Spaniards, were defeated near Bridge of Shiel by Gen. Joseph Wightman.

Stone circles, cairns, and forts are found in the eastern district. A vitrified fort crowns the hill of Knockfarrel and there is a circular dun near the village of Lochcarron. Some examples of sculptured stones occur, the finest being at Shandwick. Among old castles are those of Lochslin in the parish of Fearn, said to date from the 13th century, which, though ruinous, possesses two square towers in good preservation; Balone, in the parish of Tarbat, once a stronghold of the earls of Ross; the remains of Dingwall Castle, their original seat; and the 13th-century Eilean Donan Castle in Loch Alsh, which was blown up by English warships during the abortive Jacobite rising in 1719 but restored in 1932.

Population and Administration.—The population at the 1961 census was 57,642. There were 476 persons who spoke Gaelic only and 21,581 speaking Gaelic and English. Of the six small burghs the chief are Stornoway (pop. [1961] 5,229), Dingwall (3,752), Invergordon (1,642), and Tain (1,699). Ullapool is a fishing port near the mouth of Loch Broom. There are 12 county districts and the county with Inverness returns three members to Parliament representing Inverness, Ross and Cromarty, and the Western Isles. Dingwall, Tain, and Fortrose (*qq.v.*) are royal burghs, and Dingwall is the county town. Ross and Cromarty with Inverness, Moray, and Nairn form a sheriffdom, and there are resident sheriffs-substitute at Dingwall and Stornoway (*q.v.*), the former also sitting at Tain.

There are academies at Dingwall, Fortrose, Tain, and Invergordon.

The Economy.—Ross embraces wider extremes of farming types than any other county in Scotland. On the fertile soils along the east coast there are large and productive farms used for rotational cropping and the rearing and fattening of livestock, some of the Shorthorn herds being world famous. Heavy yields of cereals and potatoes are obtained, and the cattle and sheep are of outstanding quality. At the other extreme are the crofts of Lewis, where the climate, type of soil, and size of units are factors unfavourable to progressive agriculture. Between these extremes are the less intensive arable and stock raising farms on the poorer and higher land bordering the hills. In the county, the greater part of which is comprised of hills, large-scale sheep farming is practised. Poultry and pig keeping are mainly sidelines on mixed arable farms, there being relatively few dairy holdings. Dingwall is the principal agricultural market. Because of the unfavourable nature of most of the surface in the centre, the west, and in the islands, offering opportunity only for patchwork tillage, and because of the crofting organization of the land, the number of small holdings under 5 ac. is very large and the average size is only about 18 ac.

The natural woodlands were mostly destroyed long ago but pockets still exist and are being protected by the Nature Conservancy in the Loch Maree area. Large-scale afforestation has been undertaken, especially by the Forestry Commission, mainly in the Black Isle, among the eastern foothills, and in a few more sheltered western glens.

Herring fishing is practised in the Minch and the fishing boats make much use of Stornoway, Ullapool, and Gairloch. Whitefishing is active on a smaller scale, while lobster fishing is practised along the coasts and notably in Bernera, Lewis. Salmon fishing in the bays and river mouths is important.

The main industry is the making of Harris tweed in Lewis, employing hundreds of millworkers in Stornoway and many more handweavers throughout the island. Apart from distilleries near Tain, Alness, and Muir of Ord, most other employment is in ancillary work and services for agriculture. Much temporary employment after 1948 was provided by the construction schemes of the North of Scotland Hydro-Electric Board in the Conon Basin series of hydroelectric projects.

ROSSBY, CARL-GUSTAF ARVID (1898–1957), Swedish-American meteorologist, whose studies, particularly in atmospheric circulation, had much to do with the rapid growth of the science. Born on Dec. 28, 1898, in Stockholm and educated there, his principal published works appeared after he moved to the United States in 1925. Working first in Washington, D.C., and later as professor and head of the country's first department of meteorology at the Massachusetts Institute of Technology, Cambridge, he made important contributions to the understanding of thermodynamics of air masses and atmospheric turbulence, including ocean-air boundary problems.

In the late 1930s Rossby turned his attention to the general circulation of the atmosphere, continuing this work after becoming professor and chairman of the department of meteorology at the University of Chicago. He identified the long waves in the upper westerlies, now often called "Rossby waves," and developed the theory for their movement. He is credited with having identified the so-called "jet stream" and with having developed the principal theories for its behaviour. He also worked on models for numerical weather prediction.

After 1948 Rossby was mainly identified with the Institute of Meteorology which he founded in connection with the University of Stockholm. From 1954 until his death on Aug. 19, 1957, in Stockholm, he introduced and led worldwide studies of atmospheric chemistry and radioactivity. (H. R. B.)

ROSSE, WILLIAM PARSONS, 3RD EARL OF (1800–1867), Irish astronomer and constructor of the largest telescope that had yet been made, was born at York on June 17, 1800. In 1818 he entered Trinity College, Dublin, and proceeded to Magdalen College, Oxford, in 1821, when he was also elected to the House of Commons as Lord Oxmantown. He resigned this seat in 1834, but after his father's death he served as one of the Irish representative peers in the House of Lords. President of the British Association for the Advancement of Science in 1843 and of the Royal Society from 1849 to 1854, of which he was awarded the Royal Medal in 1851, Rosse became chancellor of the University of Dublin in 1862. He died at Monkstown, County Dublin, on Oct. 31, 1867.

Although William Herschel (*q.v.*) had pioneered in the construction of reflecting telescopes on a large scale, he never published his methods of casting and polishing specula, and so Lord Rosse was unaided in formulating his own methods. His speculum metal was composed of four atoms of copper (126.4 parts) and one of tin (58.9 parts), a brilliant alloy. Chiefly because of the brittleness of this material, Lord Rosse's first larger specula were com-

posed of a number of thin plates of speculum metal (16 for a 3-ft. mirror) soldered to the back of a strong but light framework made of a brass (2.75 of copper to 1 of zinc), which had the same expansion as the speculum metal. In Brewster's *Edinburgh Journal of Science* for 1828 Lord Rosse described his machine for polishing the speculum. In September 1839, a 3-ft. speculum was finished and mounted, but, though the definition of the images was good, its skeleton form allowed the speculum to follow atmospheric changes of temperature too quickly; therefore Lord Rosse decided to cast a solid 3-ft. speculum. Hitherto a great difficulty in casting specula was the fact that they generally cracked while cooling. Rosse experimented, ingeniously overcame this difficulty, and successfully cast a solid 3-ft. speculum in 1840. In 1842 he began a speculum of 6-ft. diameter, and in 1845 this great reflector was mounted and ready for work. Astronomers used this speculum from 1848 to 1878 and discovered many previously unknown features in nebulae, especially the similarity of "annular" and "planetary" nebulae and the remarkable "spiral" configuration in many of the nebulae. A special study was made of the nebula of Orion, and the resulting large drawing gives an extremely good representation of this complicated object.

ROSSELLINO (Rossellini), the name of a family of stonecutters from Settignano, near Florence, of whom two of five brothers, Bernardo, an architect and sculptor, and Antonio, a sculptor, are the most important.

Bernardo Rossellino (1409–64), notable early Renaissance architect and sculptor, was born at Settignano in 1409. His earliest recorded work, the upper part of the façade of the Misericordia at Arezzo (1433–35), in which a lunette with the Madonna of Mercy is set between elegant pilasters, reveals the strong influence of Filippo Brunelleschi, as does his masterpiece, the historian Leonardo Bruni's tomb (1445–50) in Sta. Croce in Florence. The Bruni monument has the form of a triumphal arch set against the wall, with the effigy resting on a classical sarcophagus and a relief of the Virgin and Child and two figures of angels above. It inaugurated a new type of sepulchral monument, which assumed great popularity and was imitated by Desiderio da Settignano and other artists. Notable alike for its architectural and sculptural qualities, this tomb ranks with the greatest achievements of Renaissance sculpture. In a tabernacle carved by Bernardo Rossellino in S. Egidio in Florence (1449–50), for which the bronze door was cast by Lorenzo Ghiberti, the influence of Brunelleschi is also dominant. His work as a figure sculptor can also be studied in two figures of the Annunciatory Angel and Virgin Annunciate in the museum at Empoli (1444–47) and the tomb of the Beata Villana delle Botte in Sta. Maria Novella in Florence (after 1451). Much of the effect of the Bruni monument is due to the extraordinarily skillful carving of the decorative ornament. Other examples of Bernardo's use of decorative carving occur in a doorway in the Palazzo Pubblico at Siena (1447) and the tomb of Orlando de' Medici in SS. Annunziata in Florence (1456). Throughout his life Bernardo Rossellino also practised as an architect, executing the Palazzo Ruccellai in Florence and the cathedral and episcopal palace at Pienza (after 1461). Between 1451 and 1453 he was employed in Rome by Pope Nicholas V on the building of St. Peter's, the restoration of S. Stefano Rotondo and other works. Bernardo became superintending architect of the *duomo* in Florence in 1461, and died in Florence on Sept. 23, 1464.

Antonio Rossellino (1427–79), sculptor, the youngest brother, born in 1427 at Settignano. His earliest authenticated work is a signed bust of the doctor Giovanni Chellini (1456; Victoria and Albert museum, London). This and a considerably later bust of the historian Matteo Palmieri (1468; Museo Nazionale, Florence) show him to have been a portrait sculptor of unusual incisiveness. About 1456 he executed a marble statue of St. Sebastian in the museum at Empoli, in which the style (like that of the portrait busts) is strongly influenced by the antique. Antonio Rossellino's most important and extended work is the chapel of the cardinal prince of Portugal in S. Miniato al Monte outside Florence for which he assumed responsibility after the death of its architect Antonio Manetti (1460), designing the pavement and episcopal throne and the tomb of the cardinal. The effigy of the cardinal rests on a reproduction of a Roman porphyry sarcophagus and is accompanied by two seated children, two kneeling angels and a circular relief of the Virgin and Child, which are some of the most distinguished marble sculptures of their time. A variant of this tomb commissioned for Mary of Aragon, duchess of Amalfi, in Sta. Anna dei Lombardi, Naples, was unfinished at Antonio's death in 1479 and was completed by Benedetto da Maiano. Also for the Piccolomini chapel in the same church he executed an altarpiece of the "Adoration of the Shepherds," in which an attempt is made to invest marble relief with the properties of a painted altarpiece. A circular relief of the "Nativity," carved in the same style, is in the Museo Nazionale, Florence. In this and in Antonio Rossellino's last work, the Nori Madonna in Sta. Croce (before 1478), some deterioration from the high standard of the tomb of the cardinal of Portugal is evident. Antonio's marble reliefs of the Virgin and Child with angels, of which the finest is in the Metropolitan museum in New York, show him at his most felicitous, and enjoyed great popularity in the 15th century.

ROSSETTI, CHRISTINA GEORGINA (1830–1894), the most distinguished of English women poets both in range and quality. She excelled in works of fantasy, in verse for children, and was supreme in her religious poetry. The youngest child of Gabriele Rossetti (*q.v.*), she was born in London on Dec. 5, 1830. In 1847 her grandfather, Gaetano Polidori, printed on his private press a volume of her *Verses*, in which signs of poetic talent are already visible. In 1850, as Ellen Alleyne, she contributed seven poems to the Pre-Raphaelite journal, *The Germ*.

In 1853, when the family was in financial difficulties, Christina helped her mother to keep a school at Frome, Somerset. It did not prosper, and in 1854 they returned to London, where her father died. In straitened circumstances, she entered on her life work of companionship to her beloved mother, devotion to her religion, and the writing of her poetry. A firm High Church Anglican, she had from religious scruples broken her engagement to the artist James Collinson, an original member of the Pre-Raphaelite Brotherhood (*q.v.*) who had become a Roman Catholic, and for similar reasons she later rejected Charles Bagot Cayley, translator of Dante; but a warm friendship remained between them. The resigned passionate sadness of unhappy love is a dominant note in her poetry. In 1862 she published *Goblin Market and Other Poems*, and in 1866 *The Prince's Progress and Other Poems*, both with frontispiece and decoration by Dante Gabriel. These, which contain most of her finest work, established her among the poets of her age.

With help from her brother William Michael the family visited France in 1861, and in 1865 she paid her only visit to Italy, commemorated in the moving sonnet "Italia Io Ti Saluto." The stories in her first prose work, *Commonplace and Other Short Stories* (1870), are of no great merit: her prose is less remarkable than her verse. *Sing-Song: a Nursery Rhyme Book* (1872, enlarged 1893), with charming illustrations by Arthur Hughes, takes a high place among children's poetry of the century.

In 1871 she was stricken by Graves' disease, which marred her looks and left her life in danger. She accepted her affliction with courage and resignation, sustained by religious faith. She published a collection of poems in 1875 (enlarged, 1890), and *A Pageant and Other Poems* in 1881. But after her illness she gave herself mainly to devotional prose writings. *Annus Domini* (1874), a book of prayers, was followed by religious meditations on the Benedicite, *Seek and Find* (1879). *Time Flies* (1885), a reading diary of mixed verse and prose, is the most personal of these writings. After *The Face of the Deep* (1892), a bulky commentary on the Apocalypse, she wrote little.

After William Michael's marriage in 1874, Christina and her mother moved from his house to Bloomsbury in 1876. Mrs. Rossetti died in 1886, and Christina spent her last years in retirement there. Her name was mentioned as a possible successor to Tennyson as poet laureate. Cancer developed in 1891, and she died on Dec. 29, 1894, and was buried in the family grave in High-

gate Cemetery. *New Poems* (1896), published by her brother, contains unprinted and previously uncollected poems.

Christina Rossetti takes foremost place among English women poets. A brilliant cartoon by Max Beerbohm in his book of cartoons of *Rossetti and His Circle* (1922) overstresses the quiet aspect of her personality. There were other aspects which she shared with Dante Gabriel. Beneath the humility, the devotion, the quiet saintlike life, lay a passionate sensuous temperament, a keen intelligence, and a detached observant humour. It is her greatness as an artist that, never straining beyond the limits of her sympathy and experience, she succeeded in uniting the two seemingly contradictory sides of her nature. There is a vein of the sentimental and the didactic in her weaker work: at her best her note is strong, personal, and unforced, with a metrical cadence unmistakably her own. In the words written by Edmund Gosse, a friend of her later years, for the 10th edition of the *Encyclopædia Britannica:*

> In the purity and solidity of her finest lyrics, the glow and music in which she robes her moods of melancholy reverie, her extraordinary mixture of austerity with sweetness and of sanctity of tone with sensuousness of colour, Christina Rossetti . . . may challenge comparison with the most admirable of our poets. The union of fixed religious faith with a hold upon physical beauty and the richer parts of nature has been pointed to as the most original feature of her poetry.

(J. BN.)

ROSSETTI, DANTE GABRIEL (baptized GABRIEL CHARLES DANTE) (1828–1882), English poet and painter, a leader of the Pre-Raphaelites, and acknowledged as their inspiration by the poets of the aesthetic movement of the 1880s and '90s, was born in London, on May 12, 1828. He was the eldest son of Gabriele Rossetti (*q.v.*) and Maria Francesca Polidori. His elder sister, Maria Francesca (1827–76), entered an Anglican sisterhood in 1873; his younger brother and sister were W. M. and Christina Rossetti (*qq.v.*).

Gabriel, who early decided to be a painter, read widely, enjoying especially the romantic and supernatural in art and literature, and began to write poems and plays. After going to King's College School (1837–41) and to a drawing school in Bloomsbury, in December 1845 he entered the Antique School at the Royal Academy. Bored with its academic method of teaching, and with the technicalities of his profession, he spent his spare time in writing poetry, and, as well as verse translations from Italian, wrote the first versions of "The Blessed Damozel," "My Sister's Sleep," "Jenny," and "A Last Confession."

The Pre-Raphaelite Brotherhood.—In 1848 Rossetti left the Academy and began to study painting with Ford Madox Brown (*q.v.*). After a time, finding Brown an exacting master, and tiring of the discipline of still-life painting, he left to join William Holman Hunt and Hunt's friend John Everett Millais in the formation of the Pre-Raphaelite Brotherhood (*q.v.*). The three young artists sought to recapture the spirit of the primitive Italian painters as revealed to them in Lasinio's engravings of the 14th-century frescoes in the Campo Santo, Pisa. Rossetti, with his enthusiasm and intelligence, was the natural leader, and it was he who later inspired William Morris and Edward Burne-Jones (*qq.v.*) to become associated with the Brotherhood.

The strictly Pre-Raphaelite period of their activity was brief, but its influence was important. After an uncompleted attempt to decorate the Oxford Union Society's new debating hall in 1857, and after Rossetti's marriage to Elizabeth Siddal in 1860, the artists went their different ways. Already, in 1853, on hearing of Millais' election as Associate of the Royal Academy, Rossetti had remarked, "So now the whole Round Table is dissolved." Only Holman Hunt remained true to the Pre-Raphaelite ideal.

Rossetti exhibited his first painting, "The Girlhood of Mary Virgin," in 1849 at the Free Exhibition at Hyde Park Corner, London, following it with the "Ecce Ancilla Domini" (or "Annunciation") in 1850; in both his sister Christina is the central figure. In 1850, Rossetti made his first appearance as a poet, contributing "The Blessed Damozel," six sonnets, and four lyrics to *The Germ,* the Brotherhood's periodical. His first volume of poetry, *The Early Italian Poets Together with Dante's 'Vita Nuova'* (1861), consists of translations from Dante and his predecessors.

After Walter Deverell in 1850 had discovered Elizabeth Siddal working in a milliner's shop in Leicester Square, London, she posed for him, and for Hunt, and Millais used her in his famous picture of the drowning Ophelia—said to be a close likeness. But it was Rossetti who claimed her as his own. Her frail delicate features, her slight figure, and her mass of gold-red hair pervade all his early paintings. After a long engagement, troubled by misunderstandings and irritations caused by Lizzie's nervous ill health, they were at last married in May 1860 when waning passion had spent itself. They lived at Chatham Place, Blackfriars, where Rossetti had his studio, and there he had made many informal drawings of her—"drawer after drawer of wonderful and lovely Guggums" (her pet name), as Madox Brown described them. These drawings are among his most sensitive work. Dogged by ill health, and after the birth of a stillborn child in May 1861, she died in February 1862 from an overdose of laudanum, whether accidental or self-administered is not known. She was buried in Highgate Cemetery

and Rossetti, in his grief and sense of guilt, laid the manuscript of his poems (the only complete copy) in her coffin. He paid his farewell tribute in a last idealized portrait, the "Beata Beatrix."

Chelsea.—In October 1862 he moved to 16, Cheyne Walk, Chelsea, henceforth his home, where he worked with energy, and with the company of younger friends, including Swinburne (*q.v.*), with whom he shared the house for a time, George Meredith (*q.v.*), and the painter Simeon Solomon. In the pictures of this middle period the intensity of his early vision weakens, and a languorous, sensuous mood replaces it. Fanny Cornforth (later Hughes) was now his favourite model. An uneducated woman, but of a golden voluptuous beauty, she acted to her own advantage at Cheyne Walk as housekeeper, as model, and as mistress. She became more demanding and less honest as time went on, but Rossetti retained affection for his "Dear Elephant" to the end of his life. In another mood Janey Morris, the wife of William Morris, is the inspiration and subject again and again of the later brooding, dreamlike pictures. In 1869 he consented to the recovery of the manuscript from Lizzie's grave. *Poems* (1870) contains, with more recent work, the poems from *The Germ,* and *The House of Life* sonnet-sequence, later enlarged.

Last Years.—An unwarranted attack by Robert Buchanan (*q.v.*) in the *Contemporary Review* (October 1871), entitled "The Fleshly School of Poetry," greatly distressed Rossetti. He replied with "The Stealthy School of Criticism" in the *Athenaeum* (December 1871), but the episode aggravated his tendency to melancholic depression, and the increasing use of chloral and whisky to combat insomnia led to a breakdown in health. During 1872–74 he was mainly at Kelmscott, sharing the tenancy with Morris. In his later years, Rossetti withdrew more and more into himself in a state of nervous melancholy. His painting became repetitive and less sure, but his literary powers did not fail. *Ballads and Sonnets* (1881) contains some of his best poetry, including the completed *House of Life* (in which the presence of Janey Morris is now felt), and the historical ballads "The White Ship" and "The King's Tragedy." He died on April 9, 1882, at Birchington-on-Sea, Kent, and was buried there. A memorial window by his friend, Frederick Shields, was placed in the church, and a cross designed by Madox Brown marks his grave. His work as an artist, including self-portraits, is well represented in all the major collections of Pre-Raphaelite painting—notably in the Tate Gallery, London; the Ashmolean Museum, Oxford; the Birmingham City Art Gallery; and the Walker Art Gallery, Liverpool.

Assessment of His Genius as Artist and Poet.—Rossetti, through his exploration of new themes and his break with academic convention, remains an important figure in the history of 19th-century English art. But his enduring worth probably lies as much in his poetry as in his painting. His best work as an artist consists of the early drawings in pen and pencil and watercolour. The portrait drawings of his mother and sister, of Elizabeth Siddal, and of Jane Burden (Mrs. Morris) are penetrating studies, firm in draftsmanship. The glowing watercolours, based on themes from Dante and Sir Thomas Malory's *Morte Darthur,* are harmonious in composition and charged with an intense and fresh poetic vision.

These qualities are less evident in his later, more sensuous, paintings. In them the mood is monotonously languid, and there is a cloying accumulation of symbolic detail. As a painter in oils he never acquired the sheer technique or feeling for pigment which marks the masters of this medium. He relies rather on colour and rhythm of design. The later pictures, with their evocative Latin titles, date, while his early Pre-Raphaelite work has a timeless poetic quality. In later years he was too ready to repeat a success and, helped by studio assistants, painted replicas of many of his popular subjects. Examples of his later work are "Proserpina" (1877; Tate Gallery, one of his many studies of Mrs. Morris), and the large "Dante's Dream" (1871; Walker Art Gallery).

Rossetti's poetry has a range and variety which his painting lacks, and he is not to be thought of only as the writer of such poems as "The Blessed Damozel." His craftsmanship gives evidence of the fundamental brainwork which he looked for in all great poetry. He is a thinker as well as a painter in words, and is a poet of speculative vision as well as sensuous passion.

In his poetry the Pre-Raphaelite love of detail is subdued by the intensity of emotion, and is employed to evoke a mood—thereby achieving an effect it often misses in Pre-Raphaelite painting, where detail is too often used for its own sake. It is by means of tiny and seemingly trivial touches that time is suspended in "My Sister's Sleep," and the very silence of the sick room is heard. "The Wood Spurge" and the lyric "I have been here before" show his mastery of similar effects. The timeless moment is again caught with exquisite skill in his sonnet for "A Venetian Pastoral by Giorgione in the Louvre"—the most successful of his highly original attempts to translate well-known paintings into verse. "The Stream's Secret," haunted by the ghost of his dead wife, evokes pity and regret by the power of its verbal music.

His skill as translator is seen in the *Early Italian Poets* . . . (revised as *Dante and His Circle,* 1874), and in his version of Villon's "The Ballad of Dead Ladies" (1870).

Rossetti is a natural master of the sonnet (*q.v.*). His finest achievement is *The House of Life* (edited by P. F. Baum, 1928), a sonnet-sequence unique in the intensity of its evocation of the mysteries of physical and spiritual love. Here, as he claimed against his detractors, "the passionate and just delights of the body are declared to be as naught if not ennobled by the concurrence of the soul at all times." Magnificent memorable lines are created with simplicity of diction: *e.g.,*

> Oh! clasp we to our hearts for deathless dower,
> This close-companioned inarticulate hour
> When two-fold silence was the song of love.
> ("Silent Noon," *House of Life,* sonnet XIX.)

There are other less subjective aspects of Rossetti's poetic art. "The Last Confession," a tragic episode set against a background of the Italian Risorgimento, is a powerful dramatic monologue which can bear comparison with Browning when he writes on a similar subject. With his feeling for things medieval Rossetti caught the spirit of the ballad. Few modern supernatural ballads are less artificial than "Sister Helen" and "Eden Bower"; and among re-creations of the historical ballad "The White Ship" and "The King's Tragedy" are outstanding. One of his earliest poems shows the power of his historical imagination. The sight of the great Assyrian winged bulls in the British Museum evoked in the "Burden of Nineveh" (1850) a meditation on the unpredictable course of civilization, rich in word-music, profound in thought, and far-ranging in imaginative vision.

ROSSETTI, GABRIELE PASQUALE GIUSEPPE (1783–1854), Italian poet, patriot, and scholar, known for his esoteric interpretation of Dante, and as the father of Dante Gabriel, Christina Georgina, and William Michael Rossetti (*qq.v.*). He was born at Vasto, southern Italy, on Feb. 28, 1783. In 1804 his poems and drawings attracted the patronage of the king of Naples'

majordomo, who sent him to Naples University. After the king's downfall (1806), he got work as librettist to the Teatro San Carlo and as subcurator at the museum. In 1809 he became a Freemason and joined the *Carbonari,* and during the revolution of 1820 was regarded as the poet of the movement.

Forced into hiding (1821), he escaped to Malta and (1824) to England, where he taught Italian and began a commentary on the *Divina Commedia,* of which only two volumes were published (1825; dated 1826). In 1826 he married Maria Francesca (1800–86), daughter of Gaetano Polidori (1764–1853), an Italian teacher who had settled in London in 1789. Her brother had in 1816 accompanied Byron into exile as his physician, but after a quarrel returned to London and in 1821 committed suicide.

Moderate prosperity and many friends—including the Dante scholar Charles (later Sir Charles) Lyell—made the Rossetti home happy. As well as teaching, Gabriele was immersed in the researches which were to become a monomania. In *Sullo spirito antipapale che produsse la Reforma* (1831) he claimed that the *Divina Commedia* was written in the code language (*gergo*) of a humanistic secret society, opposed to political and ecclesiastical tyranny. The work's antipapal character led to his appointment (although nominally a Roman Catholic) as professor of Italian at King's College, London, founded by Anglicans opposed to Catholic emancipation. He continued his researches and his poetry, publishing *Iddio e l'uomo, Salterio* (1833), poems written mainly in Malta; *Il mistero dell'amor platonico nel medio evo,* five volumes (1840), relating his theory of a medieval secret society to the Eastern mystery religions and to Manichaeism and applying it to other medieval poetry; *La Beatrice di Dante* (1842; complete ed. 1935), which interpreted Beatrice as the symbol of Dante's soul; the autobiographical poem, *Il Veggente in solitudine* (1846); *Versi* (1847); and *L'Arpa evangelica* (1853; dated 1852), lyrics expressing faith in brotherly love.

In 1842–43 ill health forced Gabriele to give up private teaching, and in 1843 he lost the sight of one eye. In 1847 he resigned from King's College. In 1850 Mrs. Rossetti opened a school at Camden Town, and in 1853 she and Christina started a school at Frome, Somerset. In March 1854 they returned to live with William Michael in London, and there, on April 26, Gabriele died.

As a poet, Rossetti was a conventional "Arcadian," showing signs of his early experience as an *improvisatore* and occasional poet. Although he was a Dante scholar of considerable gifts, his interpretations are unacceptable. But his insistence, in his commentary (his most scholarly work), that the *Commedia* must be understood allegorically, is important; and he was a pioneer in the understanding of its structure. He was not alone in interpreting parts of the *Inferno* politically, and even his application to medieval literature of Masonic ritual was developed from ideas suggested by Lyell. His poetry was long admired in Italy, and in England his personality helped to win support for his native country.

BIBLIOGRAPHY.—*A Versified Autobiography,* trans. of *Il Veggente,* with additions, by W. M. Rossetti (1901); *La vita mia* (1910), and *Opere inedite e rare,* 3 vol. (1929–31), both ed. by D. Ciampoli; E. R. Vincent, *Gabriele Rossetti in England* (1936).

ROSSETTI, WILLIAM MICHAEL (1829–1919), English man of letters, an original member of the Pre-Raphaelite Brotherhood (*q.v.*), from whose preservation and editing of Pre-Raphaelite letters, papers, and journals is derived our most authentic knowledge of the movement, was born in London on Sept. 25, 1829. Of a different temperament from his more famous brother and sister, he entered the Excise (later Inland Revenue) Office in 1845, becoming senior assistant secretary before retiring in 1894.

His literary activities were varied. As well as editing his brother's and sister's works, and publishing *D. G. Rossetti: a Memoir with Family Letters* (1895), he wrote art criticisms for the *Spectator* (reprinted as *Fine Art, Chiefly Contemporary,* 1867). An early admirer of Blake, he edited his *Poetical Works* (1874). He edited Shelley (1870; rev. 1878), and was an active member of the Shelley Society. He introduced Walt Whitman to Britain with a selection of his poems (1868). His Pre-Raphaelite papers include *Preraphaelite Letters and Diaries* (1900), and *Ruskin, Rossetti, Preraphaelitism. Papers 1854–62* (1899). Following the family tradition of Dante studies, he made a blank verse translation of the *Inferno* (1865), and a study of *Dante and His Convito* (1910). In 1891 he gave the Taylorian lecture at Oxford on Leopardi. His parallel texts of Chaucer's *Troylus and Criseyde* and Boccaccio's *Filostrato* (1875, 1883) remain a valuable aid to the Chaucer student.

In 1874 he married Emma Lucy (1843–94), the daughter of Ford Madox Brown (*q.v.*). He died in London on Feb. 5, 1919.

William Michael has been overshadowed by his brother and sister. Of high integrity, he was a devoted and self-denying son and brother, and the mainstay of his family. His critical work is worthy, and his literary interests were often in advance of his time. He strikingly exemplifies the civil servant and man of letters, in an age which allowed its public servants leisure to combine scholarly devotion to literature with fulfillment of their official duties.

For bibliography, *see* ROSSETTI, DANTE GABRIEL; ROSSETTI, GABRIELE PASQUALE GIUSEPPE. (J. BN.)

ROSSINI, GIOACCHINO ANTONIO (1792–1868), the principal 19th-century Italian opera composer before Verdi, was born at Pesaro on Feb. 29, 1792. His father was a town trumpeter and a horn-player in theatres; his mother was a singer. As a child Rossini studied singing and the piano at Bologna while his parents performed in theatres in the district. He was engaged to sing as a treble in churches and theatres, and he also played the horn. In 1807 he entered the conservatory at Bologna, but over the following years his knowledge of instrumentation was gained from independent study of the quartets and symphonies of Haydn and Mozart, rather than from his teachers. He became known as *il tedeschino* ("the little German") because of his devotion to Mozart. At age 16 he won a prize at the Bologna conservatory for his cantata *Il pianto d'armonia per la morte d'Orfeo.* His first opera, *La cambiale di matrimonio,* was performed at Venice when he was 18. Between 1810 and 1813 he produced several operas with varying success at Bologna, Rome, Venice, and Milan. *Tancredi* (Venice, 1813), based on Tasso's *Gerusalemme liberatà* and Voltaire's *Tancrède,* was his first world success. This was preceded in the same year by *Il Signor Bruschino,* the overture of which later became well known, and was followed, also in the same year, by *L'italiana in Algeri,* and in 1814 by *Il turco in Italia.* Rossini continued to write operas for Venice and Milan during the next few years, but without repeating the success of *Tancredi.*

BY COURTESY OF GEORGE EASTMAN HOUSE

GIOACCHINO ROSSINI, PHOTOGRAPHED ABOUT 1868

From 1815 to 1823 he was engaged to write two operas a year for Domenico Barbaja, the principal impresario of the time, who managed the theatres at Naples and Milan and the Italian opera at Vienna. Audiences greatly liked *Elisabetta, regina d'Inghilterra* (Naples, 1815), in which a leading part was taken by Barbaja's mistress, the Spanish soprano Isabella Colbran, whom Rossini married in 1822. In *Almaviva, ossia La precauzione inutile* (Rome, 1816), the libretto by Cesare Sterbini, was a version of Beaumarchais' *Barbier de Séville*—also the source for the libretto of Giovanni Paisiello's *Barbiere,* an opera which had enjoyed European popularity for more than a quarter of a century. Rossini conducted the work himself. On the first night the opera was hissed. A more favourable reception greeted the second performance, and before long it was realized that Rossini had created in this work a masterpiece of musical comedy, with the result that the title of *Barbiere di Siviglia* ("The Barber of Seville") passed inevitably to his opera.

It is eminent among Rossini's best works, which are remarkable for their light, captivating rhythms, their pictorial effects, particularly the long crescendo passages in his overtures, and their spontaneous melodies.

Rossini produced numerous operas during the years of his association with Barbaja. Of these, *Otello* (1816) is notable for its contrast with the treatment of the same subject by Verdi at a similar point in his development. In deference to the taste of the day the story was made to end happily. The comic opera *Cenerentola,* based on the Cinderella story, was produced at Rome in 1817, *Mosè in Egitto* ("Moses in Egypt") at Naples in 1818, and *Zelmira* at Naples in 1822. Rossini conducted his own works in Vienna in 1822 and in London the following year. In 1824 he was appointed musical director of the Théâtre Italien in Paris, and was later composer to the king and held the title of *inspecteur-général du chant en France.* At the Opéra he produced French versions of several of his earlier Italian works. *Le Comte Ory* was produced there in 1828, and the production there of *Guillaume Tell* in 1829 brought his career as a composer of operas to a close. The music of this final operatic work is largely free from the conventions discovered and used by him in his earlier works, and it therefore marks an important transitional stage in operatic development.

Apart from brief stays in Bologna and Madrid, Rossini remained in Paris until 1836. From 1836 to 1848 he lived in Bologna where he was president of the Liceo Musicale, and taught singing. In 1837 he separated from his wife and in 1845 married Olympe Pélissier. In 1848 he moved to Florence, and in 1855 returned to Paris. His comparative silence from 1832 onward makes his biography appear almost like the narrative of two lives—the life of swift triumph, and the long life of seclusion. Between 1832 and 1839 he wrote a *Stabat Mater;* its success compared favourably with the success of his operas. Among other compositions of his later years were the *Petite Messe solennelle* (1864) and a collection of piano pieces, songs, and instrumental works issued under the title *Péchés de vieillesse* ("Sins of Old Age"). Rossini died at Passy, near Paris, on Nov. 13, 1868.

BIBLIOGRAPHY.—Stendhal, *Vie de Rossini* (1824; Eng. trans. by R. N. Coe, 1956); F. Toye, *Rossini* (1934); F. Bonavia, *Rossini* (1941); L. Rognoni, *Rossini* (1956).

ROSSLYN, ALEXANDER WEDDERBURN, 1ST EARL OF (1733–1805), who, as Lord Loughborough, was successively chief justice of the common pleas and lord chancellor of Great Britain, was born in Edinburgh on Feb. 13, 1733, the eldest son of Peter Wedderburn, a lord of session under the title of Lord Chesterhall. Educated at Edinburgh University, he entered the Inner Temple in 1753. In deference to his father's wishes he qualified as an advocate in Edinburgh in 1754 and practised there for three years. He was called to the bar at the Inner Temple in November 1757 and in 1763 became a king's counsel.

His countrymen, the earl of Bute and William Murray (later Earl Mansfield), were useful to him; through the influence of Bute, then first minister, he was elected to Parliament in 1761. Wedderburn frequently changed his political allegiance. He resigned his seat in March 1769, in support of John Wilkes in the Middlesex elections dispute, thereby winning enormous popularity in the country. In January 1770 he received the pocket borough of Bishop's Castle, Shropshire, from the Whig Baron Clive. His new associates, however, distrusted him and with reason; in January 1771 he deserted to the ministry of Lord North and was made solicitor general. Throughout the American Revolution (1775–81) he savagely attacked the colonies and in June 1778 he was made attorney general. He became chief justice of the Court of Common Pleas in June 1780 and was created Baron Loughborough.

In the coalition ministry of Charles James Fox and Lord North (April–December 1783) he was first commissioner of the great seal. During the first eight years of William Pitt's ministry, he remained a supporter of Fox in the belief that there would be a reaction in his favour; but in 1792 he deserted him and in January 1793 was appointed lord chancellor in Pitt's cabinet. After Pitt's resignation in 1801, Henry Addington (later Viscount Sidmouth), the new prime minister, dismissed Loughborough, who received the consolation of the earldom of Rosslyn. He died at his country house in Stoke Poges, Buckinghamshire, on Jan. 2, 1805, and was buried in St. Paul's Cathedral, London.

On the bench his judgments were remarkable for their perspicuity, particularly in appeal cases to the House of Lords, but his knowledge of the English common law was rudimentary and he made little attempt to reform the abuses of the court of chancery.

See Lord J. Campbell, *Lives of the Lord Chancellors,* vol. vii and viii, 4th ed. (1857). (G. H. J.)

ROSSO, GIOVANNI BATTISTA DI JACOPO (1495–1540), called ROSSO FIORENTINO, Italian painter and decorator, and one of the leaders of the Fontainebleau School, was born in Florence in 1495. He may have received his early training in the studio of Andrea del Sarto, alongside his contemporary, Jacopo da Pontormo; the earliest works of these two young painters combined suggestions from Michelangelo and from northern Gothic engravings in a novel Mannerist style, characterized by its highly charged emotionalism (*see* MANNERISM). Rosso's most remarkable paintings from this period are the "Assumption" (1517; fresco at SS. Annunziata, Florence), the "Deposition" (1521; Pinacoteca, Volterra), and "Moses Defending the Daughters of Jethro" (*c.* 1523; Uffizi, Florence). At the end of 1523 he moved to Rome. Fleeing from the sack of the city in 1527, he worked briefly in several central Italian towns. In 1530, on the invitation of Francis I, he went to France (by way of Venice) and remained in the royal service there until his death in Paris on Nov. 14, 1540. His principal surviving work is the decoration of the Galerie François I at the palace of Fontainebleau (*c.* 1533–40) where, in collaboration with Francesco Primaticcio, he developed an ornamental style whose influence was felt throughout northern Europe. His numerous designs for engravings also exercised a wide influence on the decorative arts both in Italy and in northern Europe.

See Kurt Kusenberg, *Le Rosso* (1931); Paola Barocchi, *Il Rosso Fiorentino* (1950). (D. KG.)

ROSSO, MEDARDO (1858–1928), Italian sculptor, after World War II the object of much study by younger sculptors, who are interested in his sensitive modeling and elusive shapes. Of all 19th-century sculpture, the wax and plaster figures of Rosso are closest in intent to Impressionist painting because their modeling is dictated by immediate sensations of light and movement. Rosso wished his figures to be closely related to their physical environment. A sensitive and introspective portraitist, he was also socially aware and produced poignant images of illness and everyday situations, such as "Sick Child" (1895) and "Impression of an Omnibus" (1883–84). The elusiveness of his forms, which Rosso felt caught the quality of movement in life, was a shocking departure from academic art. Rosso was born June 20, 1858, at Turin and died March 31, 1928, at Milan. His influence extended through the Italian Futurists to Rodin and Brancusi, and in the second half of the 20th century was spreading still further.

See Carola Giedion-Welcker, *Contemporary Sculpture,* 3rd ed. (1961). (A. E. EL.)

ROSS-ON-WYE, a market town and urban district in Herefordshire, Eng., lies 15 mi. SSE of Hereford by road. Pop. (1961) 5,641. It is characterized by narrow streets and ancient buildings, and its pillared market house (1670) is still the scene of activity on market days. Dominating the town is the parish Church of St. Mary, built in the Decorated and Perpendicular styles. The philanthropist John Kyrle (1637–1724), known as the "Man of Ross" and eulogized by Alexander Pope in his third *Moral Epistle,* did much to benefit the town and is buried in the church. Known as "the Gateway of the Wye," the town is a tourist centre famous for its panoramic views, especially that of the horseshoe bend of the Wye from the Prospect, adjoining the churchyard. It is also the centre of a highly productive agricultural district.

ROSTAND, EDMOND (1868–1918), French dramatist, known especially as the author of *Cyrano de Bergerac,* was born at Marseilles, April 1, 1868. *Les Romanesques* (1894; English translation, *The Romanticks,* performed 1955), a fantasy in the manner of Musset, on the Romeo and Juliet theme, was Rostand's first success. This was followed by *La Princesse lointaine* (1895), in which the action symbolizes the idea that an illusion or an unattained ideal is superior to real life, and then *La Samaritaine* (1897), which dealt controversially with a biblical theme. Sarah Bernhardt acted in both plays. Rostand's next venture, *Cyrano de Bergerac* (1897; Eng. trans., 2nd ed., 1953), caused the greatest stir in the French theatre since Hugo's *Hernani.* It is a highly ro-

mantic "heroic comedy." Its hero is the 17th-century philosopher, swordsman, and man of letters, Savinien de Cyrano (*q.v.*), but the connection between its plot and Cyrano's life is remote. Well-constructed and written in eloquent verse, *Cyrano* reestablished the prestige of the alexandrine on the stage for a whole decade. It represents a revolt against all the most important trends of the time—naturalism, symbolism, and Ibsenism—and is a belated manifestation of romanticism. *L'Aiglon* (1900; Eng. trans. 1934), which followed, is a historical play concerning Napoleon I's son, the duke of Reichstadt; the duke was played by Sarah Bernhardt. *L'Aiglon* is inferior to *Cyrano* but contains some brilliant scenes and well-known pieces of rhetoric. In 1910 came the long-awaited but unsuccessful *Chantecler* (Eng. trans. 1913) in which animal characters depict the poet's own unhappy plight. Rostand's last play, *La Dernière Nuit de Don Juan,* with a prologue left incomplete at his death (in Paris, Dec. 2, 1918), was produced posthumously in 1922. He had been elected to the Académie Française in 1901.

See G. Haraszti, *Rostand* (1913); J. Suberville, *Le Théâtre d'E. Rostand* (1921). (D. Ks.)

ROSTOCK, a Baltic town and seaport of East Germany, capital of Rostock *Bezirk* (district) of the German Democratic Republic. It lies on the left bank of the Warnow estuary, 8 mi. (13 km.) SSE of Warnemünde, its outport, and 140 mi. (225 km.) NNW of Berlin by rail. The *Stadtkreis* (urban district), which includes Gehlsdorf and heathland on the right bank of the estuary as well as Warnemünde, has an area of 68 sq.mi. Pop. (1962 est.) 166,456. A train-ferry connects Warnemünde with Gedser (Denmark).

The town centre has been extensively reconstructed following heavy air raid damage during World War II. The Lange Strasse has been rebuilt in the characteristic North German style. Outstanding examples of Gothic brick buildings are the Marienkirche (1398–1472, with an astronomical clock), the Nikolaikirche (early 14th century), and the Petrikirche (early 15th century). The University of Rostock (1419) was at one time a stronghold of Lutheranism. The Rathaus in the Neuer Markt is a 15th-century structure with a Baroque facade (1727). Part of the old town walls and gates survive (the Steintor, 1575; the Kröpeliner Tor, 14th century; and the Petritor).

Rostock is the chief port of the German Democratic Republic. Its population grew considerably after 1945 and a new residential district at Reutershagen arose. Shipyards (the Neptune Wharf in Rostock and the Warnow Wharf in Warnemünde were built after 1945) and fisheries are the main industries. Diesel motors, machinery, chemical products, and matches are also manufactured.

In the 12th century Rostock was a Wendish settlement. It received its municipal charter in 1218. During the 13th century the middle town and the new town developed separately from the old town. In the 14th century Rostock became a member of the Hanseatic League. In 1323 it became part of Mecklenburg and in 1352 it passed to the dukes of Schwerin. Later it was the common possession of Schwerin and Güstrow until it finally passed to Schwerin in 1695 when the Güstrow line became extinct.

Rostock *Bezirk* was created in 1952 and comprises northern Mecklenburg and Vorpommern (Western or Hither Pomerania) along the Baltic Coast between Travemünde on the west and Ahlbeck on the east. There are 11 *Landkreisen* and 3 *Stadtkreisen* (Wismar, Rostock, and Stralsund). Along the coast cliffs alternate with sand dunes. The island of Poel and the inlet of Salzhaff lie off the western coast. On the eastern coast is the peninsula of Fischland–Darss–Zingst, the islands of Rügen and Hiddensee off Stralsund, and the greater part of the island of Usedom (Uznam). The western part of the *Bezirk* is very fertile, rye, oats, and sugar beets being grown. Cattle breeding is widespread and fishing is important off the coast. The chief ports are Wismar, Rostock, Stralsund, and Sassnitz, the latter having a train-ferry to Trelleborg, Sweden. Industry, mainly located in the towns, consists of shipbuilding, woodworking, sugar manufacture, machinery, and food industries. There are tourist resorts on the coast.

(Be. R.)

ROSTOPCHIN, FEDOR VASILIEVICH, Count (1763–1826), Russian army officer and statesman, one of the closest favourites of Emperor Paul I and military governor of Moscow during the French invasion of Russia, was born at Livny, Orel Province, on March 23 (new style; 12, old style), 1763. He was of an ancient noble family of Tatar origin. He joined the army in 1785 and traveled in Western Europe (1786–88). A few days after his accession to the throne (Nov. 17 [N.S.; 6, O.S.], 1796), Paul appointed Rostopchin a major general and his personal adjutant general. In 1798 he became foreign minister and in 1799 he was made a count. Despite all these favours, he was aware of Paul's weak character and whimsical ideas and always advised him in accord with what he considered to be Russia's true national interest. On March 4 (N.S.; Feb. 20, O.S.), 1801, shortly before Paul's assassination, he was disgraced for opposing the alliance with France. He retired to his estate at Voronovo near Moscow. In 1810 Emperor Alexander I restored him to favour, and in May 1812 appointed him commander and military governor of Moscow.

Rostopchin is alleged to have instigated the burning of Moscow on the first night after the entry of the French (Sept. 14 [N.S.], 1812); it is certain that the prisons were opened on his orders, and that he took no action to stop the outbreak. He defended himself in a pamphlet printed in Paris in 1823, *La Vérité sur l'incendie de Moscou,* but he later made serious admissions. Shortly after the Congress of Vienna, to which he had accompanied Emperor Alexander, he again fell into disgrace. He returned to Russia in 1825 and died in Moscow on Jan. 30 (N.S.; 18, O.S.), 1826. His *Mémoires écrits en dix minutes* were published in St. Petersburg (1853) and his *Oeuvres inédites* in Paris (1894).

See Marquis A. de Ségur, *Vie du Comte Rostopchine* (1873); M. de La Fuye, *Rostoptchine: Européen ou Slave?* (1937).

ROSTOV, an *oblast* (province) of the Russian Soviet Federated Socialist Republic, U.S.S.R., was formed in 1937. Area 38,919 sq.mi. (100,800 sq.km.). Pop. (1959) 3,311,747. It lies athwart the lower Don and includes the lowest part of the Northern Donets Basin and most of the Manych Basin. In the west are the low hills of the Donets ridge, but for the most part the *oblast* is low, rolling plain, cut by the broad floodplains of the rivers, especially the Don. In the east, part of the huge Tsimlyanski reservoir, formed in 1951, is included. The climate is continental and dry. January temperatures average 18° to 22° F (−7.7° to −5.5° C) and July temperatures 71° to 74° F (21°–23° C). Rainfall is about 16 in. (400 mm.) a year. The whole *oblast* lies within the steppe zone, with good chernozem soils, and much of the natural grass vegetation has been plowed up. Along the Don are floodplain meadows and marsh areas, with occasional groves of trees.

Of the 1959 population, 57% (1,898,801) were urban, living in 18 towns and 29 urban districts. Many of the towns are large, notably the major ports of Rostov-on-Don (pop. 599,542) and Taganrog (202,062), the coal-mining centres of Shakhty (196,190), Novoshakhtinsk (103,566), Kamensk-Shakhtinski (57,525) (*qq.v.*), and Gukovo (52,969), together with the Don towns of Novocherkassk (*q.v.*; 95,453) and Bataysk (52,242). The northern part of the *oblast* represents the eastern end of the Donets Basin (Donbass) coalfield and is particularly rich in anthracite. This area from 1954 to 1957 formed the separate Kamensk *oblast*. Heavy industry based on the coal is found in the ports and mining towns. The flow of freight through the *oblast* is heavy, by the Don waterway leading to the Volga and by the railway, and the gas and oil pipelines through Rostov, between the Caucasus and central U.S.S.R. Agriculture is also important, chiefly for wheat, barley, sunflowers, maize (corn), and melons. Along the lower Don vineyards and market gardening based on irrigation are important.

(R. A. F.)

ROSTOV-ON-DON (Rostov-na-Donu), a town and *oblast* centre of the Russian Soviet Federated Socialist Republic, U.S.S.R., stands on the right bank of the lower Don, 30 mi. (48 km.) above its mouth. Pop. (1959) 599,542. It was founded in 1749 as the customs post of Temernika, when the river mouth was still in Turkish hands. In 1761 the fortress of St. Dmitri was built and the town developed around it, acquiring town status in 1797.

The population rose from 3,000 in 1809 to 119,476 in 1897. The opening of the Volga-Don Canal in 1952 markedly increased the volume of trade. The town is linked to the sea by a dredged channel. It is well served by railways and lies on the Moscow-Baku road; there is also an airport. Rostov is the largest producer of agricultural machinery in the U.S.S.R. Other manufacturing products include self-propelled barges, ball-bearings, electrical and heating equipment, wire, and machinery for road-making and for the clothing and food-processing industries. There are ship and locomotive repair yards. Other local industries include the production of chemicals, clothing and footwear, glass, tobacco, and champagne. There are also flour-milling and food-processing plants. Rostov State University was founded in 1917 and there are eight other institutes of higher education. (R. A. F.)

ROSTOVTZEFF, MICHAEL IVANOVITCH (1870–1952), U.S.-Russian archaeologist, philologist, and historian, who has been called the greatest and most influential ancient history scholar of the first half of the 20th century. He was the first to use the archaeological remains of Greeks and Romans as a source for cultural history (*The Social and Economic History of the Roman Empire,* 1926, 2nd ed. 1957; *The Social and Economic History of the Hellenistic World,* 1941, 2nd ed. 1953). Born Nov. 10, 1870, near Kiev, Rostovtzeff studied at the universities of Kiev and St. Petersburg, and became familiar with the antiquities of southern Russia. He traveled to study the ruins of Pompeii; investigations of Roman lead tesserae led him into economics and social life, and the study of papyri and inscriptions resulted in work on serfdom in antiquity. Rostovtzeff's works include *Ancient Decorative Painting in South Russia* (1913); *Iranians and Greeks in South Russia* (1922); *A History of the Ancient World* (1926–28); *The Animal Style in South Russia and China* (1929). In 1918 Rostovtzeff went to the U.S., teaching at the University of Wisconsin (1920–25), and at Yale University (1925–44, professor emeritus thereafter). He directed the excavation of a Hellenistic city on the Euphrates River (*Dura-Europos and Its Art,* 1938). He died Oct. 20, 1952, in New Haven, Conn.

See C. B. Welles, "Michael Ivanovitch Rostovtzeff," *Russian Review,* vol. 12 (April 1953); J. T. Lambie (ed.), *Architects and Craftsmen in History* (1956). (C. B. Ws.)

ROSTOV YAROSLAVSKI (Rostov-Veliki), a town in Yaroslavl *oblast* of the Russian Soviet Federated Socialist Republic, U.S.S.R., stands on the northwest shore of Lake Nero on the road and railway from Moscow to Yaroslavl. Pop. (1959) 29,230. Rostov is one of the very earliest Russian towns. By the 11th century it became the seat of a bishopric. The Uspenski Cathedral was burned in 1211; its successor of 1230 still survives. Rostov derived wealth and power from its position on a main route which ran from the Moscow region to the Volga at Yaroslavl and on to the fur-providing forests of the north. In 1408 it was largely destroyed by fire. The *kreml* (citadel) on the lake shore and several 17th-century churches survive. Also of the 17th century is the Belaya Palata (White Pavilion), built to receive the tsar. The Terem, or palace of the princes, is earlier (15th century). Modern Rostov is a small, local centre, with linen and starch-making industries, but the old, traditional handicraft of enamel on metal, for which Rostov was famous, is still maintained. (R. A. F.)

ROSWELL, a city of southeastern New Mexico, U.S., about 170 mi. SE of Albuquerque, is the hub for a trade area on a radius of approximately 100 mi. Nourished by an artesian basin, the city with its thousands of trees gives the appearance of an oasis in the semiarid ranching plains. It lies at an altitude of 3,570 ft. The Pecos River flows 12 mi. to the east.

Roswell began as a trading post founded in 1871 by Van C. Smith. It was incorporated in 1891. Initially a cattle town, Roswell developed agricultural production first in orchards and alfalfa, later in cotton. Its subsequent growth can be attributed to the establishment of Walker Air Force Base in 1941, and to the location of district offices by major oil companies during the decade of the 1950s. Roswell is the seat of Chaves County and the home of the New Mexico Military Institute. The Roswell Museum and Art Center has been called a model for museums in small cities. Its major exhibits include a collection of the paintings of Peter Hurd, who was born in Roswell in 1904; the Witter Bynner collection of Chinese art; and the Robert H. Goddard rocket exhibit, commemorating and illustrating Goddard's pioneer work (much of it carried out at Roswell, 1930–41).

For comparative population figures *see* table in New Mexico: *Population.* (Pl. Hn.)

ROSYTH, a town and naval base in Fife, Scot., lies on the northern shore of the Firth of Forth, 3 mi. SE of Dunfermline. Construction of the naval base was started in 1909 but was still far from complete on the outbreak of World War I, and it was not until 1916 that the first warship was dry-docked. Among the many vessels repaired between 1916 and 1918 were the capital ships of the Grand Fleet after the Battle of Jutland. After the Armistice the number of men employed was gradually reduced and in 1925 the dockyard was placed on a care and maintenance basis until 1938. During this period the dry docks were leased to a ship-breaking firm. Among the ships broken up were the scuttled German warships salvaged at Scapa Flow. The dockyard was partially reopened by the Admiralty in 1938, and on the outbreak of World War II the labour force was rapidly expanded and more than 1,000 houses were built for skilled workers transferred from the royal dockyards in England. During the war more than 3,000 warships were repaired or dry-docked. In 1963 it was announced that Rosyth would be the refitting base for nuclear-powered submarines.

Rosyth Castle, a 16th-century tower with a dovecote, is mentioned in Sir Walter Scott's *The Abbot.*

ROTARY CLUB: *see* Service Club.

ROTATION OF CROPS refers to the repeated growing of different crops in a specified order, on the same fields, in contrast to a one-crop system or to haphazard crop successions. Well-planned cropping practices provide the basis for a smooth-running and effective farm organization. Long before the Christian era crop growers were aware of the influences of crops on each other and of the usefulness of cropping associations. Wherever food crops are produced some kind of rotation cropping appears to be practised. In central Africa the natives use a 36-year rotation. After cutting and burning a 35-year growth of woody shrubs and trees, one crop of finger millet is produced. In the food-producing regions of the world various rotations of much shorter length are widely used. Some of them are designed for the highest immediate returns without much regard for the continuing usefulness of the basic resources. Others are planned for high continuing returns with protected resources. The underlying principles for planning effective cropping systems began to emerge in the mid-years of the 19th century. The subject remains a fruitful field in agronomic research.

The oldest American rotation experiment (begun in Illinois in 1876) reveals a yield decline of 60% by mid-20th century for corn in continuous culture. When corn and oats were alternated the yield of corn declined but at a slower rate. When corn was alternated with oats and clover the yield of corn remained constant. If all crops are accounted for, as in corn-equivalent yields, the yield for a 12-year period at mid-20th century was 20.8 bu. an acre for continuous corn. When corn and oats, a low-profit crop, shared an acre equally the total yield was 22.9 bu. Where corn, oats and clover shared an acre equally, the total yield for corn and oats on two-thirds of the acre was 29.5 bu. and that for all three crops on the acre was 35.5 bu. Competing crops provided each other with advantages, and when a complementary crop was added and removed from the land the benefits were greater. If the clover crop had functioned as a rest crop rather than a hay crop its complementary effects would, no doubt, have been much greater, as other experiments have indicated.

Rotation Ratios.—Early experiments, such as those at the Rothamsted Experimental station (*q.v.*), in England, pointed to the usefulness of selecting rotation crops from three classifications: cultivated row, close-growing grains and sod-forming or rest crops. Such a classification provides a ratio basis for balancing crops in the interest of continuing soil protection and production economy. It is sufficiently flexible for adjusting crops to many situations, for making changes when needed and for including go-between crops as cover and green manures. A simple rotation

would be one crop from each group with a 1:1:1 ratio. The first number in a rotation ratio refers to cultivated row crops, the second to close-growing grains and the third to sod-forming or rest crops. Such a ratio signifies the need for three fields and years to produce each crop annually. This requirement would be satisfied with a rotation of corn, oats and clover or of potatoes, wheat and clover-timothy. If green manure or cover crops were desired, three crops could be produced in a 2:1″:0 rotation of corn, soybeans and oats (sweet clover). The mark ″ following a number means that, after a small-grain crop is harvested, a cover crop is on the land for the remainder of the year and until the following spring. Thus a green-manure crop can be grown in rotation without taking the land out of production for a year. Such a rotation could affect soil protection and production economy in a different manner than the 1:1:1 types of rotations. Rotations for any number of fields and crop relationships can be described in this manner. In general most rotations are confined to time limits of eight years or less.

Effects on Production and Soil.—In the interest of high crop incomes some farmers use a 3:0:0 type of rotation such as corn, corn and soybeans that requires annual plowing, seedbed preparation and cultivation. If continued too long such a rotation will bring about unfavourable changes in the soil as sizable reductions in organic matter and nitrogen, development of less desirable physical conditions, accelerated loss of soil and water by surface runoff and lowered nutrient-supplying powers. These changes are often accompanied with greater damage to crops from insects, diseases and weeds. The end results are declining yields, loss of crop quality and reduced incomes. Since World War II rotations of this type have been supplemented with the heavy use of fertilizer with the idea of offsetting the unfavourable effects of such rotations. Whether such a program can be continued satisfactorily will need to be judged in the light of sufficient experience.

In the interest of maximum soil protection with effective production economy, other farmers use 2:1:1 types of rotations as corn, soybeans, wheat and alfalfa for use on four fields. Additional advantages can be provided by doubling this rotation to 2(2:1″:1) for use on four fields over an eight-year period as (1) corn, (2) soybeans, (3) wheat or oats (sweet clover), (4) corn, (5) soybeans, (6) wheat or oats, (7) alfalfa and (8) alfalfa, with a moderate use of fertilizer as needed. Such rotations are increasingly effective over long-time periods but may not produce as much cash income in the beginning years as the 3:0:0 type of cropping.

Rotation planning consists essentially in fitting soils and crops together in such ways as to be suitable and desirable for livestock, grain, truck-garden and other types of farming. The acreage devoted to sod-forming and rest crops should be expanded at the expense of row crops on soils of increasing slopes and declining fertility. This will provide better vegetative covering to protect sloping land from excessive erosion and supply organic matter for improving soil productivity on both sloping and level lands. With lessening slope and increasing fertility the row crops may be expanded, but this should not be done with too much reduction in the sod-forming and rest crops. The differing effects of crops on soils and on each other and in reactions to insect pests, diseases and weeds require carefully planned sequences. Competitive and complementary relations can produce advantageous interactions.

Use of Legumes.—Rotation planning should also include a consideration of crop-handling practices. Sufficient legume residues should be returned to the soil either directly or indirectly in animal manure to supply all or much of the nitrogen required by the rotation. The nonlegume residues (stover straws) should be associated with the legume residues to obtain the greatest benefits from the legumes. Experiments show that association increases the yields of succeeding crops more than the combined yields of the two types of residues when used separately. These benefits cannot be secured if these residues are destroyed or removed from the land.

Broadly speaking, cropping systems should be planned around the use of deep-rooting legumes. If too little use is made of them, productivity will decline; if too much land is devoted to them, wastes may occur and other useful crops will be displaced. Rotations depending wholly on green-manure legumes should be confined to the more level and fertile lands. It is desirable to include legumes alone or in mixtures with nonlegume sod-forming crops as a regular crop in many field rotations. In general this should occur about once in each four-year period. Short rotations are not likely to provide the best crop balances and long rotations on a larger number of fields may introduce complications. With a moderate number of fields, additional flexibility can be provided by split cropping on some fields.

Regional Differences.—The usefulness of individual field crops is affected by regional differences in climate and soil. A major crop in one region may have little or no value in another. In each region, however, there are usually row, grain and sod or rest crops that can be brought together into effective cropping systems. The individual crops may vary much from region to region, but the rotation ratios will be somewhat similar among the regions. Some of the rotation ratios used in practice in differing regions are: 2:0:0; 0:2:0; 0:0:1; 2:1″:0; 1:1:1; 1:1:2; 1:2″:1; 2:1:1; 2(2:1″:1); 2:2:1; 2:1:2; and 1:1:3 or 4.

In addition to the many beneficial effects on soils and crops, well-planned crop rotations also provide the business aspects of farming with advantages. Labour, power and equipment can be handled with more efficiency; weather and market risks can be reduced; livestock requirements can be met more easily; and the farm can be a more effective year-round enterprise.

ROTH, WALTER RUDOLF VON (1821–1895), German philologist, a noted Sanskrit scholar, was born at Stuttgart on April 3, 1821. He was a student and later a professor at Tübingen University. His profound studies of the Vedas brought about and clarified Western understanding of these difficult religious texts. In 1846 he published *Zur Literatur und Geschichte des Weda,* a pioneer work based on manuscript materials. He edited the Atharvaveda (1856) in collaboration with his American pupil, William Dwight Whitney. In the great Sanskrit lexicon published in St. Petersburg from 1852 to 1875 by Otto von Böhtlingk and Roth, the Vedic portion is his. He died at Tübingen on June 23, 1895. (M. B. E.)

ROTHAMSTED EXPERIMENTAL STATION, at Harpenden in Hertfordshire, Eng., founded in 1843, is the oldest agricultural research station in the world. John Bennet Lawes (*q.v.;* 1814–1900), the founder, started to experiment at Rothamsted soon after coming down from Oxford in 1834. By 1842 he had discovered and patented a process for making a soluble phosphatic fertilizer (superphosphate) and initiated the fertilizer industry by opening a factory to produce it commercially. He considered 1843 to be the date of the station's foundation because it was then that he invited Joseph Henry Gilbert (1817–1901), a chemist, to work with him and started the long collaboration that lasted more than a half a century until Lawes's death; also, that year was the first year of the Broadbalk experiment on manuring of wheat, which still continues. It was one of a series designed to find the nutritional requirements of important crops, in which the same crop was grown year after year on the same land, with different plots getting different treatments but each plot getting the same one each year.

Other experiments conformed more to agricultural practice, with different crops grown in rotation. The crops, soils, manures and drainage water were analyzed and balance sheets produced to show the fate of what was added to the soil: whether it remained there, was removed in the crop or was lost. The general pattern of treatments was similar in most experiments: no manure; minerals only (minerals was the term used for the constituents of plant ash); nitrogen only; nitrogen and minerals; farmyard manure. The pattern was partly set by a controversy with the German chemist J. von Liebig, who thought plants could get all the nitrogen they need from the air. The Rothamsted experiments soon showed that Liebig was wrong and firmly established that nitrogenous manures greatly increase yields. The old experiments now provide soils unique in the information they carry about how

plant nutrients increase and decrease with different treatments.

Lawes and Gilbert are known most for their work on the manuring of crops, but they studied such problems as the purification of sewage, the advantages and disadvantages of ensiling compared with haymaking and animal nutrition. The last established the value of different components in fodder, showed how the composition of animals changes during growth and fattening and destroyed the belief that animal fat came only from vegetable fat.

A converted barn served as the first laboratory, but the practical value of the work was soon recognized and grateful farmers subscribed to a Lawes Testimonial fund, which was used to build a laboratory in 1855. This served until the numbers of staff began to increase early in the 20th century. Until then the only new appointment was a second chemist, R. Warington, who started the study of soil microorganisms and showed that ammonia is converted to nitrate in soil by their activities. Until 1904, when the Society for Extending the Rothamsted Experiments was instituted, the work was paid for wholly by Lawes, at first directly and after 1889 by the income from the fund with which he endowed the Lawes Agricultural trust, the committee of which forms the governing body of the station. Public money was first provided in 1911, after which government grants were made annually and the work is now mostly financed by grants from the Agricultural Research council. The range of problems studied steadily increased and extended to all those affecting soil fertility and the growth of healthy crops. Rothamsted is the headquarters for the soil survey of England and Wales; it also houses the Commonwealth Bureau of Soils.

In 1934 money raised by public subscription allowed the Lawes Agricultural trust to buy the Manor house (now a residential hostel for workers at Rothamsted), the home farm and other parts of the estate. Of the 600 ac., about half are suitable for experiments and carry approximately 3,000 plots each year.

Many experiments are also made at the Woburn Experimental station in Bedfordshire, started by the Royal Agricultural Society of England in 1876, and joined to Rothamsted in 1926; the different soil there allows experiments on crops for which Rothamsted farm is unsuitable. Workers at the Broom's Barn Experimental station, near Bury St. Edmunds, Suffolk, study the manuring and the pests and diseases of sugar beet. (F. C. Bn.)

ROTHE, RICHARD (1799–1867), German Lutheran theologian, one of the most daring and original of the theologians in the tradition of German idealism, was born at Posen on Jan. 28, 1799. He studied at Heidelberg and Berlin and was a professor at Heidelberg for the major portion of his career. He died on Aug. 20, 1867.

Rothe owed much to the theology and ethics of Friedrich Schleiermacher, to the romanticism of Novalis, and to the piety of August Tholuck, but he soon went his own way. He is remembered most for his monograph of 1837 on the origins of the church and of its polity (*Die Anfänge der christlichen Kirche und ihrer Verfassung*) and for his massive work on Christian ethics (*Theologische Ethik*, three volumes, 1845–48; 2nd edition, containing his own revisions but published posthumously in five volumes, 1869–71). In both books he developed his thesis that the Kingdom of God, "the new community that proceeds from the Redeemer, must begin under the form of the Church," but that the church itself is destined to wither away in favour of the Christian state, which is to be both a religious and a moral society. Underlying this interpretation of the Kingdom of God was a profoundly evolutionary view of the historical process, whereby God, in his freedom, produced matter, out of which, in succession, mechanical nature, chemical nature, vegetative nature, and animal nature were evolved. Finally the human soul emerged from the animal nature to make man what he is. The coming of sin was both a disruption of the divinely planned evolutionary history of man and, because it brought the Redeemer, a divinely willed means for the consummation of that history. The goal of history was the elevation of man, and indeed of a "spiritualized" creation, to the level of the personal life of God.

His principal works remain untranslated, but his most charming book, *Stille Stunden* (*Still Hours*), gathered from his devotional writings in 1872, was translated into English by Jane T. Stoddard and published with an introductory essay on his life and thought by J. Macpherson in 1886.

Jahrhundert*, pp. 544–552 (1947).

(J. J. Pn.)

ROTHENBURG OB DER TAUBER, a town of West Germany in the *Land* (state) of Bavaria (Bayern), Federal Republic of Germany, is 53 mi. (85 km.) W of Nürnberg by rail. Pop. (1961) 11,134. It stands above the deep-cut, winding valley of the Tauber and is encircled by medieval, many-towered walls. The town hall has a 13th-century Gothic part and a Renaissance part (1572–78) with a Baroque arcade (1681). In it every Whitsuntide is performed a play—*Der Meistertrunk*—commemorating the siege of Rothenburg by J. T. Tilly, general of the Catholic League in the Thirty Years' War, in 1631. The church of St. Jakob (1373–1528) has a wooden altar by T. Riemenschneider (d. 1531). Rothenburg lies on the scenic route known as the "romantic road," leading from Würzburg to the Bavarian Alps. It has manufactures of baby carriages, soap, agricultural machinery, and clothing and textiles. There are also sandstone and limestone quarries. First named early in the 9th century as Rotinbure, it became a free imperial city in 1274 and attained its zenith under burgomaster Heinrich Toppler (1373–1408). (H.-J. Wi.)

ROTHENSTEIN, SIR WILLIAM (1872–1945), English artist whose portraits are notable for fine draftsmanship and sense of character, was born at Bradford, Yorkshire, on Jan. 29, 1872. He studied at the Slade School, in London, under Alphonse Legros and in Paris at the Académie Julian. In Paris he was encouraged by Degas and Whistler. He began exhibiting in 1891. He was principal from 1920 to 1935 of the Royal College of Art and served as an official British war artist in World Wars I and II. His paintings include the "Coster Girls" (1894; Graves Gallery, Sheffield); "The Browning Readers" (1900; Bradford Art Gallery); "The Dolls' House" (1899) and "Cliffs at Vaucottes" (1909, both in Tate Gallery, London); "Morning at Benares" (1911); and "Bourlon Church" (1919). His portraits include those of Walter Pater (1894), Algernon Swinburne (1895), Auguste Rodin (1897), Henry James (1898), and Joseph Conrad (1905), in the National Portrait Gallery, London; G. K. Chesterton (1922), Bernard Berenson (1910), Sir Rabindranath Tagore (1912), and a self-portrait (1900), in the Metropolitan Museum of Art, New York City. He painted one of the historical panels in St. Stephen's Hall, Westminster. Knighted in 1931, Rothenstein died on Feb. 14, 1945. A memorial exhibition of his work was held at the Tate Gallery in 1950.

His published works include *Oxford Characters* (1893); *English Portraits* (1897); *The French Set, and Portraits of Verlaine* (1898); *Manchester Portraits* (1899); *Liber Juniorum* (1899); a *Life of Goya* (1900); *Plea for a Wider Use of Artists and Craftsmen* (1918); *Twenty-Four Portraits* (1st series, 1920; 2nd series, 1923); *Ancient India* (1925); *Men and Memories* (3 vol., 1931–39).

His son, Sir John Rothenstein, the author of a number of books on painting, was appointed director of the Tate Gallery in 1938. Another son, Michael Rothenstein, became a painter.

ROTHERHAM, a county and parliamentary borough in the West Riding of Yorkshire, Eng., 6 mi. (10 km.) NE of Sheffield. Pop. (1961) 85,478. Area 14.5 sq.mi. It lies at the confluence of the Don and the Rother, which affords a notable north-south route on the east side of the Pennine upland. Rotherham is connected by the Don Canal with Goole and the Humber and is a railway and road junction. There are Bronze and Iron Age barrows, and remains of a Roman fort and settlement in the vicinity. Rotherham was taken by the Royalists in 1643, but after the Battle of Marston Moor it was surrendered to a detachment of parliamentary forces. Its industrial prosperity may be said to have begun when ironworks were established at Masborough on the opposite bank of the Don in 1746. It was incorporated in 1871 and became a county borough in 1902. A museum and art gallery was opened in 1893

and a technical college, art school, and a central public library in 1931. On Old Rotherham Bridge is a 15th-century chapel. The parish church of All Saints is 15th-century Perpendicular. In the mid-1950s there were four large parks and other open spaces covering about 500 ac. The principal industries are steel, iron, brass, glass, coal and its by-products, general engineering, brewing, and corn milling.

Wentworth Woodhouse, 4 mi. NW, is an 18th-century mansion partly inhabited by Earl Fitzwilliam and partly used as a training college for teachers.

ROTHERMERE, HAROLD SIDNEY HARMSWORTH, 1ST VISCOUNT (1868–1940), British newspaper-owner, brother of Lord Northcliffe (*q.v.*), and the commercial brain behind the development of his publishing empire. He was born at Hampstead, April 26, 1868, the second son of Alfred Harmsworth. Largely under his mother's influence, he left the civil service in 1888 to become financial manager of his brother's magazine, *Answers*, which he saved from collapse. Thereafter he was the business genius in all of his brother's enterprises, balancing Northcliffe's enthusiastic creative exuberance with hardheaded financial realism sometimes bordering on cheeseparing, which, although it infuriated Northcliffe, ensured the stability essential to success.

Whereas Northcliffe was interested in newspapers for themselves, Rothermere was interested in them as a means of making money. To this end he brought ruthlessness and shrewd judgment. He quickly saw how much newspapers would benefit from controlling their own newsprint supplies, and founded the huge Anglo-Newfoundland Development corporation in 1906. He was created a baronet in 1910, and raised to the peerage in 1914. After a brief period as air minister in World War I, he received a viscountcy in 1919. Although he failed to secure control of the *Times* on Northcliffe's death (1922), he acquired his brother's majority interest in the other Northcliffe papers on favourable terms and began a series of operations which first gave him control of Sir Edward Hulton's Manchester newspaper properties (most of which he later resold at a profit) and then involved him in a bitter conflict, over the acquisition of a chain of provincial evening newspapers, with the Berry brothers (later Lord Camrose and Lord Kemsley) to whom, however, he sold the Northcliffe periodical interests, Amalgamated Press, for £8,000,000.

His journalistic judgment was less shrewd than his business sense. Under him the *Daily Mail* lost its lead and he nearly ruined the *Daily Mirror* before he sold it in 1931. His support for the British Union of Fascists and his attacks on all forms of public expenditure alienated readers and advertisers, and his attempt in 1929 to dictate terms to Stanley Baldwin (including the right to approve ministerial appointments before they were made) in return for his newspapers' support, brought a crushing rejoinder. His attempt to force Baldwin's hand by means of the United Empire party campaign, at first in conjunction with Lord Beaverbrook and then on his own, failed completely. Only abroad did he achieve the political acclaim he felt he deserved, when in 1927 his advocacy of a review of the treaty of Trianon brought an offer of the crown of Hungary. This he had the good sense not to accept.

Although ruthless in business and without his brother's personal magnetism, he was generous and both his personal and public benefactions were considerable. At the outbreak of World War II he accepted a mission to Canada, where his interests gave him great influence. But his health broke and he died, Nov. 26, 1940, at Hamilton, Bermuda. (E. F.-Ws.)

ROTHES, EARLS OF. GEORGE LESLIE (*c.* 1417–1489/90), the son of Sir Norman Leslie of Rothes in Moray and of Ballinbreich in Fife, was created earl of Rothes between 1457 and 1458. His grandson WILLIAM LESLIE (d. 1513), the 3rd earl, was killed at the Battle of Flodden and his great-grandson GEORGE LESLIE (d. 1558), the 4th earl, was accused of complicity in the murder (1546) of Cardinal Beaton, but was acquitted at his trial in 1547. In 1558 he was one of the Scottish commissioners in Paris who witnessed the marriage of Mary Stuart and Francis, dauphin of France (afterward Francis II).

His son ANDREW LESLIE (d. 1611), the 5th earl, took an active part with the lords of the congregation, first against the queen mother, Mary of Lorraine, the regent of Scotland, and afterward against Mary Stuart, opposing her marriage to Lord Darnley (1565) and helping to plan the murder of her secretary David Rizzio (1566). He later changed his allegiance and fought for Mary at Langside in 1568. He continued to occupy a position of some prominence in Scottish affairs until his death. His grandson JOHN LESLIE (*c.* 1600–1641), the 6th earl, a strong opponent of episcopacy, in 1637 led the opposition to the introduction in Scotland of a new liturgy based on the English prayer book, and in the following year signed the National Covenant to defend the Presbyterian religion. His son JOHN LESLIE (*c.* 1630–1681), the 7th earl, fought for Charles II at the Battle of Worcester in 1651. At the Restoration in 1660 he was appointed lord president of the council for Scotland and became lord high treasurer for Scotland (1663) and keeper of the privy seal (1664). Deprived of all his offices in April 1667 through the influence of John Maitland (later duke of Lauderdale), he was consoled in October by being appointed lord chancellor of Scotland for life. He was created duke of Rothes in 1680, but on his death without male heirs, the dukedom became extinct. The earldom continued through his daughter MARGARET LESLIE (d. 1700). JOHN LESLIE (*c.* 1698–1767), the 10th earl, made the Army his career, fought at Dettingen (1743), and was commander in chief in Ireland (1758–67). From him is descended the 20th earl, MALCOLM GEORGE DYER EDWARDES LESLIE (1902–). (T. I.)

ROTHESAY, a royal burgh and the chief town of the county and island of Bute, Scot. Pop. (1961) 7,687. Lying on Rothesay Bay, on the eastern coast, it is a holiday town and conference centre, with a promenade 4 mi. (6.4 km.) long and a pavilion (1938). It is linked to the mainland by passenger and car ferries to Wemyss Bay (Renfrew) and Colintraive (Argyll). The sheltered bay affords excellent anchorage and is the headquarters of a submarine squadron. In the centre of the town are the ruins of a castle, originally erected *c.* 1098 either by Magnus Barfot, king of Norway, or by the Scots as a defense against the Norwegians. It is said to have been demolished by Robert Bruce, and the ruins today appear to be of 14th-century date. The village which grew up round the castle was made a royal burgh by Robert III, who in 1398 created his eldest son David duke of Rothesay, a title that became the highest Scottish title of the heir apparent to the throne of the United Kingdom. During the Commonwealth, Rothesay Castle was garrisoned by the parliamentarians. It was burned by the followers of Argyll in 1685 and remained neglected until the rubbish was cleared away by the second marquess of Bute in 1816. It was repaired by the third marquess and is now maintained by the Scottish National Trust. Although agriculture is the chief industry, the manufacture of fine tweed cloth is becoming increasingly important. There are cruises from Rothesay to the Kyles of Bute, around Arran, and to Campbeltown and Inveraray. The town is under the jurisdiction of a provost and council.

ROTHSCHILD, the name of a great European Jewish banking family, the name being derived from a red (*rot*) shield on the house in which the family lived in the ghetto of Frankfurt am Main, Ger., during the early part of its history.

MAYER ANSELM ROTHSCHILD (1743–1812), the founder of the house, was born Feb. 23, 1743. He established moneylending branches in Europe and England, with his sons acting as branch managers. ANSELM MAYER ROTHSCHILD (1773–1855), his eldest son, born June 12, 1773, remained with his father and took over the Frankfurt house. SOLOMON ROTHSCHILD (1774–1855), the second son, born Sept. 9, 1774, settled in Vienna; NATHAN MAYER ROTHSCHILD (1777–1836) settled in London, KARL ROTHSCHILD (1788–1855) in Naples, and JACOB or JAMES ROTHSCHILD (1792–1868), born May 15, 1792, in Paris. The founder laid down two maxims for the conduct of the banking operations of his family: conduct all operations in common, and set definite limits to each operation and never aim at exorbitant profits.

The Naples house was discontinued after the annexation of Naples by Italy in 1860.

Nathan Mayer, in London, came to be regarded as the financial genius of the family. The political events of the Napoleonic Wars

gave the House of Rothschild its historic eminence. During that period, the Rothschilds raised £100,000,000 for the European governments. Anselm Mayer, the eldest brother, became a member of the Prussian Privy Council of Commerce, and in 1820 Bavarian consul and court banker; Solomon, who settled in Vienna, was on terms of intimacy with Metternich; and Jacob, of Paris, negotiated large loans for the Bourbons. All of Mayer's sons received the right to use "von" before their names and were made Austrian barons in 1812. The Rothschilds controlled European finance for many years.

The important London house, after Nathan Mayer's death in 1836, was managed by his son LIONEL ROTHSCHILD (1808–1879), born Nov. 22, 1808, who became the first Jewish member of Parliament, in which he served from 1858 to 1874. His son NATHAN MAYER ROTHSCHILD (1840–1915) was born Nov. 8, 1840, inherited a baronetcy from his uncle ANTHONY DE ROTHSCHILD (1810–1876) and was made a peer in 1885, the first Jew to be raised to the British peerage. Nathan's son succeeded to the title (*see* ROTHSCHILD, LIONEL WALTER ROTHSCHILD, 2nd Baron), and in his turn was succeeded by his nephew, NATHANIEL MAYER VICTOR ROTHSCHILD (1910–), a grandson of the 1st baron, who was chairman of the Agricultural Research Council (1948–58).

The head of the London family has been considered the lay head of British Jewry. The Balfour Declaration of Nov. 2, 1917, stating that the British government viewed with favour "the establishment of a national home for the Jewish people" in Palestine, was addressed to Lord Rothschild. EDMUND JAMES ROTHSCHILD (1845–1934), of the French branch of the family, invested more than 70,000,000 gold francs in helping to establish Jewish communities in Palestine.

Three of the Rothschilds have entered politics. LIONEL NATHAN ROTHSCHILD (1882–1942) was a member of the House of Commons, 1910–23. JAMES ARMAND ROTHSCHILD (1878–) entered the House of Commons in 1929. MAURICE ROTHSCHILD (1881–) was a member of the French senate.

Other eminent members of the French branch of the family have been EDOUARD ROTHSCHILD (1868–1949), who was president of the Chemins de Fer du Nord, and HENRI ROTHSCHILD (1872–1947), physician and playwright.

Two great-great grandsons of Mayer Anselm continued the British house of N. M. Rothschild and Sons: LIONEL DE ROTHSCHILD (1882–), born Jan. 25, 1882, and ANTHONY GUSTAV DE ROTHSCHILD (1887–1961).

No adequate history of the Rothschild family exists, but the following may be consulted: E. C. Corti, *The Rise of the House of Rothschild* (1928); C. Roth, *The Magnificent Rothschilds* (1939); F. Morton, *The Rothschilds, a Family Portrait* (1962). (J. R. LT.)

ROTHSCHILD, LIONEL WALTER ROTHSCHILD, 2ND BARON (1868–1937), British zoologist who founded the Tring Museum of Natural History, eldest son of Nathan Mayer, 1st Baron Rothschild, was born on Feb. 8, 1868, in London. In 1917 his Zionist sympathies and preeminent position in the Anglo-Jewish community caused the British foreign secretary Lord Balfour to address to him the letter (known as the Balfour Declaration) declaring the British government's interest in establishing a Jewish national home in Palestine (*see* ZIONISM). Rothschild was a trustee of the British Museum (1899–1937), a member of Parliament (1899–1910), a fellow of the Royal Society (1911), and president of the zoological section of the British Association (1932). The museum he founded (subsequently presented to the British Museum) included the largest and most valuable collection of natural historical specimens ever assembled by one man, containing the largest collection of butterflies and moths in the world (more than 2,000,000 specimens and many thousands of types), and also a unique library of over 30,000 volumes. His collection of 280,000 bird skins is now in the American Museum of Natural History in New York City. He published alone or in collaboration with his museum staff over 800 papers and monographs dealing with zoological and botanical subjects. Lord Rothschild died on Aug. 27, 1937, at Tring, West Hertford, Eng.

See *Novitates Zoologicae*, vol. xli, pp. 1–41 (1938–39), which includes a list of Lord Rothschild's works. (M. L. RD.)

ROTHWELL, an urban district in the Normanton parliamentary division of the West Riding of Yorkshire, Eng., about 4 mi. SE of Leeds. Pop. (1961) 25,360. Area 16.7 sq.mi. Soon after the Conquest, Rothwell was a dependency of the castle of Pontefract, and a baronial residence, of which there are slight remains, was erected there. Coal, stone, sand, clay, and gravel are obtained and the town has copper tube, rope, chemical, and engineering factories. Rhubarb is produced on a large scale indoors. Methley urban and Hunslet rural districts were added to Rothwell in 1937.

Rothwell in Northamptonshire is a small manufacturing town 4 mi. NW of Kettering.

ROTIFERA (ROTATORIA), well-defined group of aquatic animals of microscopic size, noteworthy for the diversity of their forms, the vivacity and variety of their movements and the complexity of their structural development. They are often called wheel animalcules because in some species the ciliated bands on the head beat in a manner suggestive of the rotation of a wheel or wheels (see *Corona*, below). In length they range from .05 to 2 mm., but most are between 0.1 and 0.4 mm. In general rotifers are symmetrical in structure, although some are highly asymmetrical.

General Features.—The body, which is covered with a thin, flexible cuticle overlying a syncytial epidermis, is, in many species, weakly differentiated into several regions: head, neck, trunk and foot. These regions are separated from each other by folds (often a separate neck is not present). The foot may be divided into sections by folds. The sections, often called segments or joints, do not, however, reflect true metamerism.

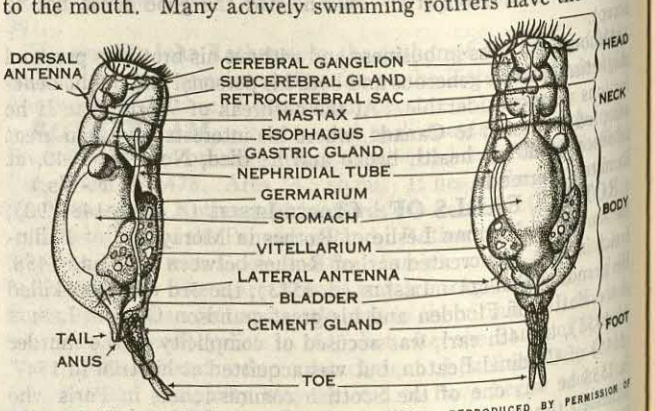
The foot, an extension of the body posterior or ventral to the anus, bears at its end two conical toes, and contains within two pedal or cement glands which secrete a sticky material through ducts that open at the tips or near the base of the toes. The tail is the fold or prolongation dorsal or anterior to the anus.

At the head end is a flattened ciliated area, the corona, with a mouth near the ventral or posterior edge.

Corona.—Food is collected and swimming is brought about by the action of numerous cilia on an area close to or encircling the mouth, or on fringing lobes protrusible from the mouth. The whole area, including the mouth itself, as seen when the cilia are active, is called the corona. There are many varieties of this organ, differing widely in the arrangement of the cilia and in the presence of accessory structures.

The basic corona type can be regarded as a ciliated band around the head. The corona, prolonged posteriorly on the ventral side, encloses a bare apical area. Some rotifers have tufts of elongated cilia at the sides of the mouth or buccal area. Other species have lateral ciliated ridges, auricles, projecting from the head, the ciliation either being continuous with the buccal area, or limited to the edges. Auricles may be introvertable, in which case they are extended only when the animal is swimming.

Other coronal variations involve reduction of the ciliated band to a very narrow strip and reduction of the ciliation posterior to the mouth. Many actively swimming rotifers have the corona



FROM WARD AND WHIPPLE, "FRESH-WATER BIOLOGY" (1959); REPRODUCED BY PERMISSION OF JOHN WILEY & SONS, INC.

FIG. 1.—ANATOMY OF A REPRESENTATIVE ROTIFER SHOWING (LEFT) LATERAL AND (RIGHT) DORSAL VIEWS, GREATLY ENLARGED

reduced to a thin strip of cilia surrounding the head and enclosing a large apical area. A snoutlike projection or rostrum may be developed from the apical area.

In many species the cilia on the anterior and posterior margins of the ciliated areas are elongated. The anterior line of larger cilia is the trochus, the posterior line is the cingulum. The edges of the corona may be elaborated into lobes. The bdelloids (order Bdelloida), the extreme development of this type, have the dorsal margin so deeply indented toward the ventral side that it has cut through, breaking the trochus into two circles; these are the "rotating wheels" seen in many bdelloids.

The corona of members of the family Collothecidae represents a great modification. The anterior part of the body is drawn out into a wide bowl, the margin of which is usually lobed and covered with very long generally nonvibratile bristles (setae). Within the bowl is a ventral shelflike membrane, usually ciliated. There may be vibratile cilia inside the bowl and, in some species, on the margin as well; however, most do not have coronal cilia. Some adult collothecids lack coronal cilia, except for a small area at the bottom of the bowl.

Foot.—The foot may be highly developed, rudimentary or even absent as in many open-water (planktonic) species. There is often only one toe, representing a fusion of two. The toes of some rotifers are long, unequal, slender filaments, with the cement glands opening at the base. Other species lack these filaments and have a ciliated cup at the end of the foot. In the sessile species the foot usually ends in a stalk attachment or peduncle. The foot, in some species, may be withdrawn into the body.

Body Wall.—In many rotifers the cuticle is thin and pliable; in others it may be thickened in places, forming relatively stiff plates which together form the lorica. Often the anterior and posterior margins of a lorica have prominent spines, and a few rotifers have spines on the dorsal surface. Some animals have fairly flexible plates, difficult to differentiate from the connecting areas of cuticle. In some rotifers the lorica is simple and consists merely of a general thickening of the cuticle of the body, forming a boxlike structure devoid of obvious differentiation within the different regions. More commonly, however, the lorica consists of an arched dorsal plate and a flat ventral plate fused together at their edges. In such cases the anterior part of the flat plate may be connected with the arched plate by a pliable cuticular membrane which stretches to accommodate the head when it is retracted. Some have the dorsal and ventral plates joined together by lateral strips of thin cuticle folded inward, forming deep grooves along the sides; others have a dorsal groove.

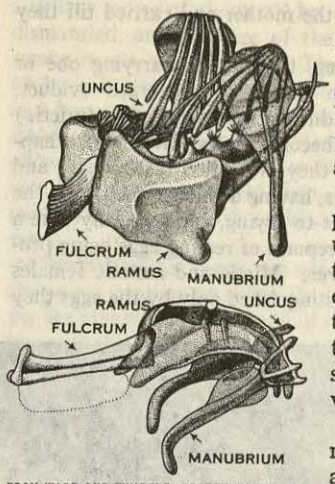
Other modifications of the body wall are movable bristles and paddles, quite different from the spiny extensions of the lorica. They may be long slender filaments, flat paddles or hollow outgrowths of the body furnished with spines and powered by large muscles.

Digestive Tract.—From the mouth a ciliated gullet leads to the mastax. The cuticular lining of the pharynx is thickened, forming the trophi or jaws. Following posteriorly from the mastax, the rest of the digestive tract consists of an esophagus, a thick-walled cellular stomach and a relatively thin-walled, syncytial intestine, the posterior portion of which is differentiated as a cloaca.

The anus opens on the dorsal surface; however, in genera in which the foot projects from the ventral surface, the anus opens posterior to the foot.

Trophi.—The trophi are very characteristic features of the rotifers, and are found in no other group of animals. There are several major variations of trophi structure associated with food and feeding methods. Some types serve a simple grinding function. Others may be thrust from the mouth to grasp prey. Still others are used for sucking out the contents of organisms.

Usually, rotifer trophi consist of seven separate pieces arranged in three sections. An unpaired median ventral fulcrum is attached to a pair of rami (sing. ramus) which move in opposition to each other like a pair of pliers. Altogether, these three sections are the incus. The rami are pulled away from each other by muscles attached to the fulcrum and to the outer part of the bases of the rami. Lying adjacent to each ramus is a structure, the malleus, which consists of two pieces, a toothed uncus and a manubrium; these two pieces, hinged together, move in a plane at right angles to the rami.



FROM WARD AND WHIPPLE, "FRESH-WATER BIOLOGY" (1959); REPRODUCED BY PERMISSION OF JOHN WILEY & SONS, INC.

FIG. 2.—MAJOR PARTS OF TWO TYPES OF ROTIFER TROPHI

In addition to these standard parts, there may be others: subunci, rods connecting each ramus to its corresponding uncus; an epipharynx, one or more rods in the wall of the gullet and serving to support the mouth. Other supporting members may be developed elsewhere.

The Muscular System.—The muscular system is composed of a group of longitudinal and circular bands in the body wall, a network of muscle in the viscera, and a few muscles between the viscera and body wall. In some rotifers some of the more powerful muscles are conspicuously cross striped or striated.

Nervous System and Sense Organs.—The chief part of the nervous system consists of a large cerebral ganglion and smaller ganglia associated with the mastax and foot. Numerous nerves lead to muscles and sense organs.

There are three conspicuous touch (tactile) sense organs on the body: two lateral antennae located toward the posterior end, and a dorsal antenna on the midline of the head. The dorsal antenna represents the fusion of two antennae and receives two nerves; a few rotifers actually possess two dorsal antennae lying close together. The corona may support stiff cirri (apparently derived from cilia), which are said to serve a tactile function. The foot sometimes has a tactile bristle on the dorsal surface just anterior to the toes.

Excretion.—The excretory system consists of a pair of convoluted tubes (protonephridia) which begin with special end cells called flame bulbs. Most commonly the tubes lead to a bladder from which a duct leads directly to the distensible cloaca; but in some species the protonephridia empty into the cloaca.

Secretion.—In most rotifers the gastric glands are attached to the anterior part of the stomach. In addition, there may be accessory glands elsewhere along the digestive tract.

The adhesive secretion of the cement glands in the foot is used for attachment, for leechlike creeping (alternate attachment of sticky foot and head end) and in the construction of tubes in some sessile forms. In sessile species there may be no distinct cement glands, the secretion being produced by swellings of the epidermis.

In the head are located prominent glands of unknown function: an unpaired glandular retrocerebral sac having a long forked duct opening on the apical region of the corona; and a pair of subcerebral glands lying beside the duct of the retrocerebral sac and the ducts leading to the apical area. The sac and glands together compose the retrocerebral organ. Rotifers may have either sac or glands; both, or neither. In some species the ducts are degenerate.

Reproduction.—The reproductive system is of taxonomic importance; the division of the group into classes is made on the basis of the number of ovaries and the development of males. Most rotifers have one ovary, but the bdelloids and seisonids have two. In the former the female reproductive system lies ventral to the digestive tract. The ovary (vitellogermarium) consists of a small germarium that supplies nuclei to eggs, and a massive yolk-gland (vitellarium). An oviduct leads from the ovary to the cloaca.

The rotifers ordinarily found are amictic females; *i.e.*, they reproduce parthenogenetically by diploid eggs (*see* PARTHENOGENESIS). The eggs may be released free in the water, may be laid on plants or other surfaces; in most planktonic species the eggs

may be attached to the lorica of the mother and carried till they hatch.

Some rotifers bear living young, the mother carrying one or more developing embryos within the greatly enlarged oviduct. Under adverse environmental conditions, special females, (mictic) may lay haploid eggs which then become males. When such haploid eggs are fertilized, however, they are called resting eggs and give rise to females. Resting eggs, having a thicker shell than the parthenogenetic ones, are resistant to drying, and generally take a longer time to hatch. There are reports of resting eggs being produced parthenogenetically, however. Mictic and amictic females usually look alike; they can be distinguished only by the eggs they produce. In a few species, though, there are observable differences between them.

Males, undescribed for most species, have been found in many species of the order Monogononta. Males are apparently absent among the bdelloids, but the seisonids regularly produce them. In a few genera the males look like miniatures of the females, except for the reproductive system. In most genera, however, there is great morphological difference between the sexes (sexual dimorphism); *e.g.*, the males lack a digestive system and bear no resemblance to the females. The occurrence of males, where they are known, is restricted to short periods, though they may become very abundant while they are present. The male reproductive system of members of the Monogononta usually consists of a testis and a ciliated sperm duct with glands. The tip of the duct is capable of being turned outward (eversible) and may be lined with thickened cuticle, forming a penis.

Ecology and Distribution.—Rotifers have a distribution that is usually regarded as potentially cosmopolitan. Many species, since they are so easily dispersed, are, in fact, nearly world-wide in their distribution. The occurrence of most species in a given locality seems to be mostly the result of specific environmental features of that locality, not by its geographical location. Nevertheless, some species show a distinctly limited range: a few, some very common, are found only in North America; others have been reported only from Europe; a number of species are restricted to warmer climates or at least tropical and subtropical locations, while others are not found in the tropics. In general, the fauna of high altitudes and high latitudes is composed of relatively few species of wide distribution.

Rotifers are plentiful in most bodies of freshwater, especially ponds and bogs. Some are restricted to sea water or saline or alkaline lakes, and are tolerant of wide variations in salinity. A few bdelloids live only in places intermittently wet, such as among the parts of land-growing mosses and liverworts. Most species live along the shore (littoral zone) swimming much of the time in close contact with plants and other surfaces. The planktonic species occur in greatest numbers in open water. Some live within the cells of water plants. A few are commensal, living in the gill-chambers of fresh-water crabs and crayfish or attached to the outside of certain aquatic worms (Oligochaetes). The adults of sessile species live attached to the leaves and stems of water plants; their larvae are free-swimming.

While they live mostly in wa-

DETAIL OF ROTIFERA GROUP IN $\frac{1}{2}$ IN. OF POND-BOTTOM WATER

At upper left is main stem of a bladderwort (*Utricularia vulgaris*), a water plant, showing at centre bottom bladder (utricle) about size of a pin head in the living plant. At bladder's lower right margin is trap door, with remains of captured rotifers visible inside. Stem is covered with tiny algae. At centre right is a spherical colony of rotifers (*Conochilus hippocrepis*). Above it is *Notommata copeus* with auricles extended. At left centre is crescent-shaped desmid (*Closterium*), an alga

ters of moderate temperature (10° to 20° C.), some have been found in hot springs, and others are restricted to arctic and antarctic waters. Some are capable of withstanding freezing or drying for extended periods.

The duration of their individual lives has been little studied; however, some species are known to live a few days only, while others survive more than a month.

Systematic Affinities.—Much uncertainty and dissension has been expressed about the relationships of rotifers. In some works they are regarded as one of a group of related minor phyla, but in a widely used classification (that of Libbie H. Hyman) they are a class of the phylum Aschelminthes, which includes also the following groups: Gastrotricha, Kinorhyncha (Echinodera), Priapulida, Nematoda and Nematomorpha (Gordioidea).

The following is a working classification:

CLASS ROTIFERA

Order 1. Seisonaceae (Seisonidea).—Slender with long necks, living on the marine crustacean Nebalia; sexes of equal size and like form; two ovaries. Example, *Seison.*

Order 2. Bdelloidea.—Bottom-dwelling (benthonic) rotifers with jointed cuticle; both ends retractile into the trunk; corona of two trochal discs, set on pedicels; two ovaries; mastax ramate; males lacking. Examples, *Philodina, Rotaria, Habrotrocha.*

Order 3. Monogononta.—Sessile or free-swimming rotifers; one ovary, males more or less reduced in size and structure.

Suborder 1. Ploima.—Free-swimming rotifers, with undivided terminal or ventral corona, not consisting of trochal and cingular circlets; foot with usually two toes; one ovary; mastax various. Examples, *Notommata, Proales, Synchaeta, Trichocerca, Euchlanis, Brachionus, Lecane, Asplanchna.*

Suborder 2. Floscullariacea.—Sessile or swimming rotifers with more or less lobed corona of trochal and cingular circlets; toes lacking; mastax malleoramate; one ovary. Examples, *Floscularia, Conochilus, Limnias, Hexarthra, Filinia, Trochosphaera.*

Suborder 3. Collothecacea.—Mostly sessile rotifers with large funnel-like corona, often lobed, lacking a ciliary border in most forms; mastax uncinate; toes lacking. Examples, *Collotheca, Stephanoceros, Cupelopagis.* (W. T. E.)

ROTOGRAVURE: *see* GRAVURE.

ROTOR SHIP, a vessel utilizing revolving cylinders, called rotors, for auxiliary power. Anton Flettner, the German engineer who invented the rotor ship, originally intended to construct ships with metal sails. In 1922, however, experiments at the University of Göttingen, Ger., with revolving cylinders indicated that the pressure exerted upon a cylinder revolving in an air current was considerably greater than had been supposed. When disks of larger diameter than the cylinders were provided at the ends, moreover, it was found possible to increase the wind effect to 9 or 10 times the amount of effect in normal sail. To achieve this effect the revolving speed of the cylinders had to be about 3 to 4½ times as great as the speed of the wind.

Though an ordinary sailing vessel is required to take down all canvas in a hurricane, it was claimed that the rotor ship could continue sailing.

Tests were made with a three-masted schooner, the "Buckau," which had a displacement of 960 tons and was fitted with an auxiliary motor of about 200 hp. The canvas rig of the vessel was dismantled, and in place of the fore and third masts two very strong masts were erected. The new masts were shorter, being 42 ft. in height. They were provided with bearings at the upper and lower ends to allow for the free rotation of the cylinders, which were placed over the masts. The cylinders were fitted at either end with disks of greater diameter than the cylinders that were built as part of them. The cylinders were rotated by means of motors, which could drive the towers at a speed of 125 rpm.

Circumferential speed was approximately 60 ft. per second, and the power required to rotate the towers was about 9 hp. By altering the circumferential speed of one or another of the cylinders, it was said, the pressure exerted by the wind could be correspondingly changed and so alter the vessel's course.

Sea tests were claimed to be successful, but little was heard of the subject thereafter. (F. J. D.; X.)

ROTORUA, a city of Rotorua County, North Island, N.Z., lies about 150 mi. SE of Auckland by road at 938 ft. (286 m.) above sea level. Pop. (1961) 19,360. Situated at the southwestern end of Lake Rotorua in the heart of the thermal belt of North Island, the city grew up between two Maori villages: Ohinemutu, on the shore of Lake Rotorua, and Whakarewarewa, which is the centre of a remarkable array of hot springs, boiling mudpools, and spouting geysers. Rotorua was made a municipality in 1922 and received city status in 1963. Its bathhouse with its curative mineral waters and the adjacent gardens were formerly the main attraction for visitors, and there is a government sanatorium on the lake shore. Now the tennis courts, bowling greens, and swimming pools, and the yachting, bathing, and fishing facilities of the lake are equally important. However, the city's recent growth in population and its economic expansion owe more to forestry, farming, and administration than to tourism. In the late 1920s exotic conifers were planted on much of the volcanic plateau of North Island. The work was largely centred in Rotorua, and Whakarewarewa is the site of the Forest Research Institute and the Forestry Training School.

In 1939 the New Zealand forest service established at Waipa, near Rotorua, the country's first large-scale sawmill to be built on the modern Swedish pattern. Others were set up in the area after World War II by private enterprise. Since the 1930s, when the cobalt deficiency of the pumice soils of the region around Rotorua was discovered, the task of reclamation and development for dairying has been undertaken by the Department of Lands and Maori Affairs operating from Rotorua. (K. B. C.)

ROTROU, JEAN DE (1609–1650), French dramatist, called by Voltaire the founder of French drama, was born at Dreux in June 1609. More is known of his family than of his own life. He was educated in Paris, wrote his first extant play (*L'Hypocondriaque,* publ. 1628) before he was 20, and a few years later emerged as protected by Richelieu and earning an assured income as writer for the chief established theatre of the capital, the Hôtel de Bourgogne. Rotrou returned to Dreux at the age of 30, married, served for a time as a magistrate, and died of the plague (June 28, 1650). He seems to have been a man of retiring disposition, conciliatory, and unselfish.

His 35 extant plays show the evolution of public taste in drama and the increasing attraction of the theatre for the rising middle class. Nearly half are tragicomedies, by which was meant a serious play involving peril but not death; the title was in one or two later altered to *"tragédie."* For Rotrou, with Corneille, whom he admired, and one or two more, invented French Classical tragedy. He saw that this new form of social pleasure, both spectacular and declamatory, might achieve emotional effects more powerful and delicate than rough prose drama. With a generous admixture of incident and reversal of fortune he allied discussion of moral issues and portrayal of character under strain. He did much to refine the instrument he had invented, by concentration, omitting extraneous incident, and intensifying psychological motivation. His characters are faced with choices: the king's son in *Cosroès* (1648), between power and loyalty; the king in *Venceslas* first condemns his son to execution, and then abdicates in his

favour. Racine gratefully borrowed from his study of *Antigone* (1638), and the starkest scene in *Britannicus* is reworked from Rotrou's *Belissaire* (1644). His sense for comedy was no less keen: in *Les Sosies* (1636 or 1637) he discovered the delicious comic situation which Molière was to perfect in *Amphitryon*.

Rotrou is a writer of power. He uses the alexandrine with great effect for resonant expression of stress and violence. He has the rhetoric, the concentration, the formal structure of the Classical manner, together with a Baroque sense of surprise, contrast, tension, and illusion. The last is most powerfully shown in *Le Veritable Saint-Genest* (1647), showing an actor whose professional martyr's role turns into personal conviction.

BIBLIOGRAPHY.—H. C. Lancaster, *History of French Dramatic Literature in the 17th Century*, Pt. 1, vol. 1 (1929) lists the plays and revises the dating given by other authorities, with detailed references. There are modern editions of *Venceslas* (by T. F. Crane, 1907); *Saint-Genest* (T. F. Crane, 1907; and, with excellent introduction, by R. W. Ladborough, 1954), and *Cosroès* (by J. Scherer, Societé des Textes Français Modernes, 1950). *See* also A. Adam, *Histoire de littérature française au 17e siècle*, I (1949). (W. G. ME.)

ROTTERDAM, the second largest city of the Netherlands, is situated in the province of South Holland, about 19 mi. (30 km.) from the North Sea on both banks of the Nieuwe Maas (a northern distributary of the Rhine). By 1964, on the basis of total tonnage of cargo handled, it ranked as the largest port in the world. It is connected with the North Sea by a wide canal called the New Waterway. Pop. (1964 est.) 731,525 (mun.).

Rotterdam takes its name from the Rotte, a river which in former times flowed through the marshland of South Holland into the Nieuwe Maas. A strong dike was built on the north bank of the Nieuwe Maas in about 1240, shutting off the Rotte by a system of locks. A small colony that settled on this dam was granted certain charters in 1299 and 1328. In 1340 Count William IV of Holland bestowed city rights on Rotterdam and gave the citizens the concession to dig an open canal to the Schie, another right-bank tributary of the Nieuwe Maas. This great privilege gave Rotterdam a link with the more important towns of Delft and Leiden and with The Hague which was on its way to becoming the centre of government, while the Rotte only led to the still sparsely populated marshland. Its favourable position between the great market town of Dordrecht and the other Dutch towns was a reason for the city's rise to prosperity. Its thriving growth was stemmed when in 1488 Frans van Brederode, leader of the nobles in revolt against the sovereign, Maximilian of Austria, gained possession of Rotterdam and used it as a base from which he conducted his military campaigns and pillaged the surrounding countryside.

In 1563 a large part of the town was destroyed by fire and in April 1572 it was occupied and plundered by Spanish troops. When the Spaniards withdrew, Rotterdam ranged itself on the side of the prince of Orange. In the ensuing peace it enjoyed a period of great prosperity. From the southern Netherlands, where Philip II's authority had been restored, many people fled north for reasons of faith, and a number of merchants and artisans, mainly from Antwerp, settled in Rotterdam. The city council was then much under the influence of Johan van Oldenbarnevelt, who later played an important part in the government of his country and subsequently died on the scaffold. Under his auspices, in the last quarter of the 16th century, an ambitious plan was laid for the enlargement of the town. In the river in front of Rotterdam mud flats had formed; harbours were dug out of these, and the soil thus obtained was used to heighten the remaining ground; quays were constructed and houses built. The scale of this plan was so immense that the city was provided with sufficient possibilities of expansion for the next two and a half centuries.

In the 17th and 18th centuries Rotterdam increased steadily in importance. Trade was principally centred on France and England, but there was also shipping to Indonesia and America. The Court of the Fellowship of the Merchant Adventurers had been at Rotterdam since 1635; it was transferred to Dordrecht in 1656, but this circumstance had no detrimental effect on trade relations with England. After the revocation of the Edict of Nantes (1685) many French Protestants came to Rotterdam, where they contributed largely to the city's prosperity. The years of French domination (1795–1813) were lean years for Rotterdam, and it was long before prosperity returned.

In the 19th century there was also a shift of trade; transit trade grew more important and it needed time for the port to adapt itself to the new situation. After 1850 Rotterdam grew rapidly, chiefly as a result of the German unification in 1870 and the industrialization of the Rhineland in general and of the Ruhr area in particular. With the expansion of the town, a vast network of harbours was made, stretching along the New Waterway (planned by Pieter Caland) and in open communication with the sea; and this made Rotterdam one of the best equipped ports in the world. World War I and the economic depression of the 1930s were severely felt in Rotterdam.

In World War II the city and port suffered tremendously. On May 14, 1940, the German *Luftwaffe* destroyed practically the entire city centre and an extensive part of the east district. About 900 people were killed (though much higher figures were given at the time, owing to the confusion) and approximately 78,000 were rendered homeless. Of public buildings, only the city hall (1920), the main post office (1923), the stock exchange, the famous Boymans Museum, and some minor buildings escaped destruction. More than one-third of the total length of quayside for seagoing vessels and about 40% of the port's equipment were destroyed by the Germans in the autumn of 1944.

Apart from some 18th-century houses, Rotterdam possesses only two buildings of historical interest: the 15th-century St. Laurens Church and the Schielandshuis. The former was very badly damaged in the bombing but by the early 1960s was almost completely restored, and the tombs of the famous admirals Cortenaer, Witte de With, and Van Brakel were reinstated. Since 1959 services

F. J. ROTGANS, AMSTERDAM

THE HARBOUR AT ROTTERDAM, ONE OF THE LARGEST IN THE WORLD

have been held regularly in the church. The Schielandshuis, built in 1662–65 by Jacob Lois, was the meeting place for the dike-reeve (*dijkgraaf*) and his fellow reeves (*hoogheemraden*) of Schieland, where they deliberated upon everything concerning the dikes of that part of Holland. It now houses the Historical Museum. Also of historical interest is Hendrik de Keyser's beautiful statue of Erasmus, the great Rotterdam humanist, which was placed on the Grote Markt in 1622. It was spared by the fire of May 1940 and removed to a place of safety. After the war it was erected again on the van Hogendorpsplein in the neighbourhood of the Schielandshuis. Because of the construction of an underground railway, the statue had to be moved again and found its final place at a site near St. Laurens Church. The Boymans Museum, rehoused in 1935, acquired the famous Van Beuningen collection in 1958 and has since borne the official name Boymans-Van Beuningen Museum. It houses old and modern paintings of the Netherlands ranging from Van Eyck to Van Gogh; and also contemporary paintings, sculptures, drawings, prints, ceramics, glass, pewter, silver, lace, and furniture. Other important museums are the Maritime Museum and the Ethnological Museum. The municipal library is famous for its unique collection of Erasmiana. The Netherlands School of Economics (founded in 1913 by private initiative) is also in Rotterdam.

Immediately after the bombing of the city centre the area was cleared for rebuilding. To facilitate central replanning the entire devastated area was expropriated and the city architect, W. G. Witteveen, was commissioned to prepare a plan, some parts of which were carried out during the occupation. However, in 1946, it was superseded by a more radical plan, drawn up under C. van Traa, director of town planning and reconstruction. By the mid-1960s the greater part of this plan had been completed. Meanwhile the city was expanding outward by the construction of housing and industrial estates. Particularly noteworthy of the new buildings are the Central Railway Station (1957); the Wholesalers' Building (1952), accommodating the business premises of over 200 wholesalers; the Building Centre (1948–55), an international research and information centre for building and interior decoration; the Lijnbaan shopping promenade (1953–55), which consists of about 75 shops and is open only to pedestrians; the Bijenkorf department store (1955–57), the only building designed by a foreign architect (Marcel Breuer); the Dijkzigt City Hospital (1961). A controversial memorial monument of the May 1940 bombing (by Ossip Zadkine) was inaugurated in 1953 and, four years later, two monuments were unveiled, one in memory of the fallen (by Mari Andriessen) and one to honour the merchant navy for its wartime service (by F. Carasso).

The restoration of the port facilities was completed in 1949. The number of ships that entered and the amount of goods handled before the war (1938) were surpassed in 1952 and 1954 respectively. In the early 1960s, of the total trade of Rotterdam about one-third was transit trade. Almost half the cargo moving through Rotterdam-Europoort was oil, and the port is linked with Godorf, near Cologne, by oil pipeline. The harbour basins and port facilities are continuously being extended. The Botlek plan, comprising 3,336 ac. of industrial sites and harbour basins, had practically been realized by the mid-1960s. The Europoort plan, comprising 3,830 ac. of industrial sites and harbour basins, opposite the Hook of Holland, begun in 1958, was one-third complete by that time. In connection with these developments the world's first school for training dockers was opened in Rotterdam.

In May 1940 Waalhaven airport, the first civil aerodrome in Europe, was destroyed. In 1953 the heliport of the city centre (daily connections with Antwerp, Brussels, and other places) was opened. The new Rotterdam airport, north of the city, was opened in 1956. After World War II Rotterdam aimed even more than before at broadening, and thus strengthening, its economic basis by sponsoring new enterprises. Its industries include the largest oil refineries in Europe, several shipbuilding yards, engineering works, automobile-assembling plants, the processing and manufacture of coffee, tea, cocoa, tobacco, margarine, clothes, paper, railway material, and all kinds of chemical products. There are also breweries and distilleries.

ROUAULT, GEORGES (1871–1958), French painter and engraver, perhaps the greatest religious painter since Rembrandt, was born in Paris on May 27, 1871, the son of a cabinetmaker, in working-class surroundings. He was taught to appreciate art by his grandfather Champdavoine, an admirer of Daumier, whose work was to influence Rouault decisively. Apprenticed to a glazier from 1885 to 1890, Rouault worked on the restoration of the stained-glass windows of Chartres cathedral; and these awakened his feeling for decorative and architectural values and for the monumental use of colour and line. Gustave Moreau, under whom he studied at the École des Beaux-Arts in 1892, introduced Rouault to the work of Leonardo da Vinci and of Rembrandt, but during 1898–1902, influenced by Toulouse-Lautrec and Cézanne, Rouault developed a new style, producing water colours of sober tints (blues predominating) with strong tones and emphatic forms. Hideous prostitutes, terrifying judges, repulsive millionaires, pitiful poor people, and tragic clowns (these as the symbol of the anguish of mankind) portray "the dereliction of man without God." Rouault was converted to Roman Catholicism (*c.* 1895) and later became the friend of J. K. Huysmans and Léon Bloy.

BY COURTESY OF MUSÉE D'ART MODERNE, PARIS
"LA SAINTE FACE," 1933, BY GEORGES ROUAULT

From 1906 to 1910 Rouault took an interest in pottery; and from 1917 onward he practised engraving (some of his later masterpieces were to be in this medium). In oils he began to build up colour, solidity, and tension in his compositions of the story of the Passion of Christ. From 1914 to about 1935 he pursued this hieratic style. From 1935 to about 1948, Rouault's painting became more serene and was characterized by the appearance of graceful feminine figures. He now produced small canvases on which the paint was applied thickly and with the glowing lustre of enamel. Tranquillity gave place in 1948 to an impulse of joy. Using greens and yellows (both new to his palette) so thickly as to give the appearance almost of relief, Rouault infused his works, particularly his landscapes, with universal significance and religious grandeur. Such a reawakening in an artist approaching 80 was exceptional. After this swan song he painted little more, but waited quietly for his death in Paris on Feb. 13, 1958.

Rouault stood apart from his contemporaries. Evoking form by a new use of colour and outline whose very flatness becomes monumental, he drew inspiration from French medieval masters, uniting religious and popular traditions, divorced since the Renaissance. To secular art he brought back craftsmanship and the sense of congruity between the sublime and the grotesque. To religious art he restored its concern with both human life and the transcendental. *See* also PAINTING: *Fauvism*.

(B. DL.)

ROUBAIX, a manufacturing town in the Nord *département* of France, 6½ mi. NE of Lille, lies on the Roubaix Canal which links the lower Deule with the Scheldt by way of the Marcq and the Espierre. Pop. (1962) 112,567. It unites with Tourcoing (*q.v.*) to form a large industrial centre. The town's more important buildings and institutions include Saint-Martin Church, dating from 1471 and restored in 1849; Notre Dame Church (1846); the Hotel de Ville (1911) containing a collection of paintings by J. J. Weerts; the Chamber of Commerce (opened 1908); the National Higher School of the Textile Arts and Industries, with at-

tached museum containing paintings, sculptures, and fabrics; the attractive Barbieux public park; the municipal sports centre and open-air school for boys and girls, and the swimming baths.

Roubaix has been called the Manchester of France, and has a universal reputation and market for its textiles. More than 200 establishments are engaged in the production of woolen, cotton, and other fabrics, including spinning, wool combing, dyeing, and weaving. There are also rubber and plastic factories. The town has a lively trade and is the centre of a network of road services.

The prosperity of Roubaix had its origin in the charter granted in 1469 by Charles the Bold, duke of Burgundy, to Peter, lord of Roubaix and a descendant of the royal house of England. This charter permitted the citizens to dress all in wool. In the 18th century the town suffered from the jealousy of Lille, of which it was a dependency, and it was not until the 19th century that its industries acquired importance. During World War I it was occupied by the Germans, and manufacture came to a standstill. As the cotton spinning plants were mostly spared, its industry was restarted in 1919 with government aid and bank credits. It was again occupied by the Germans in 1940. After World War II the employers' and workers' associations formed cooperative organizations for professional guidance, health measures, and housing. A bold housing policy assisted the construction after 1949 of more than 12,000 dwellings.

ROUBILLAC (ROUBILIAC), **LOUIS FRANÇOIS** (1705?–1762), probably the greatest sculptor at work in England during the 18th century, was born of French parentage at Lyons, probably in 1705. He was apprenticed to B. Permoser and later became assistant to Nicolas Coustou. He came to London about 1732 and was employed by Thomas Carter the elder. His first independent commission was the statue of Handel for Vauxhall Gardens in 1737, and a year later he set up for himself in St. Martin's Lane. In 1746 he carved the monument of the duke of Argyll in Westminster Abbey, one of his greatest works, though his more dramatic monument of Lady Elizabeth Nightingale in the same building is better known. Other works by him in the Abbey include the monuments of Field-Marshal Wade, Admiral Warren, and Handel. Outside London his most important monuments are those of Miss Myddleton at Wrexham, Denbighshire, Viscount Shannon at Walton-on-Thames, Surrey, and the duchess of Montagu at Warkton, Northamptonshire.

Roubillac's busts are unsurpassed, for he had the seeing eye as well as the skilled hand, and examples can be seen at Windsor Castle, Wilton House, Wiltshire, Trinity College, Cambridge, and the National Portrait Gallery, London. Statues by Roubillac include Sir Thomas Molyneux in Armagh Cathedral, Lord President Forbes in the Advocates Library, Edinburgh, and Sir Isaac Newton at Trinity College, Cambridge. G. Vertue, who knew Roubillac well, rightly described his works as "curious and excellent, with great skill and variety, picturesque, so light and easy, as painting." Roubillac died on Jan. 11, 1762, and was buried in the graveyard at St. Martin-in-the-Fields, London.

See K. A. Esdaile, *The Life and Works of Louis François Roubiliac* (1929); Rupert Gunnis (comp.), *Dictionary of British Sculptors 1660–1851* (1953). (R. Gs.)

ROUEN, a city of France, capital of the *département* of Seine-Maritime and the ancient capital of the province of Normandy, lies on the Seine 75 mi. (121 km.) NW of Paris by road. Pop. (1962) 118,775. Rouen is an important industrial and commercial centre, and also one of the most interesting artistic centres in Europe. Its numerous churches, ancient monuments, and old houses have given it the title of "Ville Musée." The old city lies on the north bank of the river in a natural amphitheatre formed by the hills which border the Seine valley. It is surrounded by the suburbs of Martainville, Saint-Hilaire, Beauvoisine, Bouvreuil, and Cauchoise; 2½ mi. E is the industrial town of Darnétal; and on the opposite bank of the Seine is Saint-Sever, which before its almost complete destruction in World War II was an important industrial district. In the mid-1960s it was being rebuilt as a residential suburb of Rouen. Sotteville (pop. 32,998) and Petit Quevilly (pop. 21,065) are nearby industrial suburbs. Also part of Rouen is the Île Lacroix, in the Seine.

Monuments.—In the centre of the old town is the Cathedral of Notre-Dame, one of the finest Gothic churches in France. Most of it was built in the first half of the 13th century, on the site of an earlier cathedral burned in 1200, but work was not completed until 1544. The cathedral was badly damaged by Allied bombardment during World War II, and reopened in 1956 after restoration. The western facade (1509–30) is intricately decorated, with a great central doorway. The portals of the transept are each flanked by two towers, and the central tower (495 ft. [151 m.], the tallest church tower in France) over the transept has a famous carillon. In 1934 there was found, beneath the floor of the choir, the substructure of the crypt of the Romanesque building consecrated in 1063. The Lady Chapel (enlarged 1302–20) is the most interesting feature of the interior, with the tomb (1518–42) of the two cardinals d'Amboise, archbishops of Rouen, a masterpiece of Renaissance workmanship. Behind the cathedral is the archbishop's palace, dating from the 15th and 18th centuries.

The former abbey church of Saint-Ouen, on the south side of the Place du Général-de-Gaulle, was founded in 1318 on the site of a Romanesque church. The present church, an outstanding example of late Gothic, was built mainly during 1318–39 and the western facade in the mid-19th century. The tower over the transept (1490–1515) has an octagonal lantern (the Tour couronnée or "Crown of Normandy") flanked by four turrets. The stained-glass windows are of the 14th–16th centuries. The graceful effect of the interior is created by the delicately slender soaring shafts and absence of nonstructural ornamentation. The south transeptal entrance, or Portail des Marmousets, has reliefs on the tympanum representing the Assumption of the Virgin Mary, surmounted by a magnificent rose window.

The Church of Saint-Maclou, behind the cathedral (begun 1434; consecrated 1521), is a rich example of the Flamboyant style. The lofty spire of the tower was added in 1868. The church was damaged in 1944. It has an elaborate portal with biblical scenes carved on the wooden doors, probably by Jean Goujon. The former charnel house of the church, dating from 1533, is one of the few relics of this kind remaining in France. The 16th-century Church of Saint-Vincent, near the Seine, was destroyed by bombing in 1944. Its finest stained glass is in the Musée Le Secq des Tournelles, which contains a unique collection of ironwork. There is fine stained glass also in the churches of Saint-Patrice and Saint-Godard.

The most important secular building in Rouen is the Palais de Justice, once the seat of the exchequer and later of the *parlement* of Normandy. It was severely damaged during World War II and was not completely restored by the 1960s. The building is in late Gothic style. South of the Palais de Justice is the Gros Horloge, a belfry built in 1389, adjoining which is a great gateway (1527) with a clock. The Tour de Jeanne d'Arc is all that remains of a castle built by Philip Augustus (probably in 1205), in which Joan of Arc was imprisoned. In the Place du Vieux Marché, Joan was burned at the stake in 1431. There are some interesting old mansions, including the Hôtel de Bourgthéroulde (1486–1531).

Of the museums in Rouen the Musée des Beaux-Arts, adjacent to the municipal library, is one of the most important provincial art galleries in France, with a fine ceramic collection. The Musée d'Antiquités contains religious sculptures and works of art, and Egyptian and Greek antiquities. The Musée d'Histoire Naturelle, one of the most complete of its kind, also contains a remarkable prehistory section. The University of Rouen was founded on June 9, 1964, and opened on Oct. 1, 1964.

Rouen is an important centre for trade in wines, spirits, grain, and cattle. Coal, grain, vegetables, fruit, wine, timber, and petroleum are leading imports. Besides its manufactures, it exports petroleum products, kaolin, sugar, cereals, and flour. The principal industries of Rouen and its district are the spinning and weaving of cotton, notably the manufacture of *rouenneries* and *indiennes*, the printing and dyeing of the manufactured material and the spinning of other fibres. There are also locomotive repair shops and shipyards; facilities for the manufacture of clothing, chemicals, fertilizers, soap, machinery, and newsprint; and distilleries and petroleum refineries. The port of Rouen, the chief river

port of France, comprises the marine docks, extending for 8,000 m. (8,750 yd.) to La Bouille, and the river dock, extending for 1,000 m. (1,094 yd.) and including a timber, a petroleum, and a repairing dock. The Seine is tidal beyond Rouen. The port is accessible for ships drawing 16½ ft. (5 m.) up to 27 ft. (8.2 m.) of water.

History.—Ratuma or Ratumacos, the Celtic name of Rouen, was modified by the Romans into Rotomagus and by medieval Latin writers into Rodomum, of which the present name is a corruption. Under Julius Caesar and the early Roman emperors the town was the capital of the Veliocassi, and it was not important until it became the centre of Lugdunensis Secunda at the end of the 3rd century. It was taken by the Normans in 841 and again in 876. In 912 it became the capital of the duchy of Normandy, which from 1066 to 1204 and from 1418 to 1449 was an English possession. In 1203 it was the scene of the murder of Arthur of Brittany at the hands of King John of England, the last duke of Normandy. Ostensibly to avenge the crime, Philip Augustus invaded Normandy and entered Rouen after a siege of 80 days. The prosperity of the town grew and a pact between its merchants and those of Paris, relating to the navigation of the Seine, was followed by treaties with London, the Hanseatic towns, Flanders, and Champagne. In 1302 the seat of the exchequer or sovereign court, afterward the *parlement*, of Normandy was fixed at Rouen. A stubborn resistance was offered to Henry V of England, who after a long siege occupied the town in 1419; the French recaptured it in 1449. In the late 15th and early 16th century Rouen was a centre of art and culture but it suffered severely in the Wars of Religion and was sacked by the Protestants in 1562. After the revocation of the Edict of Nantes in 1685 it lost more than half its population, and the textile industry did not recover until the 18th century.

During World War II, Rouen was severely damaged in 1940 and 1944, nearly half the city being destroyed, but large-scale reconstruction was undertaken and Rouen remains one of the most interesting cities in northern France.

ROUGE: *see* Cosmetics and Cosmetology.

ROUGET DE LISLE, CLAUDE JOSEPH (1760–1836), French writer, author of "La Marseillaise." He was born, May 10, 1760, at Lons-le-Saunier, Jura, entered the army, and became a captain of engineers. While stationed in Strasbourg he composed both words and music of the "Chant de guerre pour l'armée du Rhin" on the night of April 25, 1792, after an official dinner at which his host had suggested he should write a war song. The song was adopted by the Provençal volunteers prominent in the storming of the Tuileries and thereafter, as the "Hymne des Marseillais," became the anthem of revolutionary France. Rouget de Lisle, a moderate republican, was relieved of his commission and imprisoned for a year during the Terror but was freed after the counterrevolution. Though granted his former rank in the army in 1795 and later promised promotion, he resigned his commission in 1796. Louis Philippe awarded him a small pension in 1830. He died in Choisy-le-Roi, Seine et Oise, on June 27, 1836. He published *Essais en vers et prose* in 1797, composed the settings for *50 Chants français* (1825), and wrote numerous songs.

See J. Tiersot, *Histoire de la Marseillaise* (1915).

ROUGH CAST, in architecture, a term used in the United States for the rougher textures of a stucco surface, obtained either by throwing on the finished coat in unequal masses or by sprinkling over the finished surface, while still wet, a coating of coloured pebbles, tile or brick fragments, marble chips, etc. In England the term is used for any stucco or mortar combined with gravel and sand, employed as the finishing coat of covering plaster over a rough structure of masonry and frequently decorated by the addition of coloured pebbles or small pieces of glass.

ROUHER, EUGÈNE (1814–1884), French statesman, highly influential as a conservative minister under the Second Empire and a leader of the Bonapartist party under the Third Republic, was born on Nov. 30, 1814, at Riom, Puy-de-Dôme. Trained as a lawyer in Paris, he practised at the bar in Riom until he was elected to Parliament in 1848. He made his mark as a vigorous conservative, demanding the suppression of socialism and its "baneful theories," and insisting on the need for "order" and "strong government." He enlisted in the cause of Louis Napoleon (*see* Napoleon III), in whom he saw a "saviour of society" against the revolutionary menace; and in October 1849 Louis Napoleon, as president of the Second Republic, appointed him minister of justice. In this post, as head of the government prosecution office, Rouher was energetic in suppressing left-wing opposition. After the *coup d'état* of December 1851, he was responsible for drawing up the constitution which gave France 18 years of despotism, reinforced by the proclamation of the Second Empire in December 1852.

After a period as vice-president of the Conseil d'État, Rouher was, on Feb. 3, 1855, made minister of agriculture, public works, and commerce, in which office he worked to promote the economic prosperity for which this period is famous. He believed that social progress could best be obtained by the government's establishing political "order" and giving private enterprise a free hand to expand in the economic field. He was thus Napoleon III's principal instrument in introducing free trade into France in 1860.

On Oct. 18, 1863, Rouher became minister of state, that is, premier. His capacity for work, his command of detail, and his vigour as the government's spokesman in Parliament won him great influence: he was nicknamed "the vice-emperor." Hostile to the movement for liberal concessions, he did much to postpone its success; when it triumphed, he was overthrown and retired to the post of president of the senate (July 1869).

The fall of the Second Empire gave Rouher a new political role. He was the principal organizer of the Bonapartist party after 1870, and served as member of Parliament from 1872 to 1882. He owed his leadership of the party largely to the confidence placed in him by the former empress Eugénie (*q.v.*), who approved of his conservative views. The result of their combined policy was that Bonapartism tended more and more toward a narrow conservatism which demanded a regime based on a popular vote but offered the people no prospect of real power or liberty, and so became virtually indistinguishable from the program of the other monarchist pretenders. Rouher died in Paris, on Feb. 3, 1884.

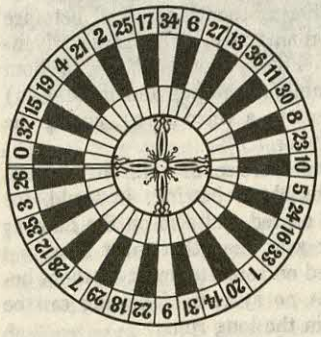
ROULERS, Belgium: *see* Roeselare.

ROULETTE, a gambling game of French origin, is universally played in the gambling casinos of Europe and North and South America, but is especially identified with the gaming rooms at Monte Carlo. It is not very old as games go, dating probably from the late 18th to the early 19th century. In the U.S. its popularity as a heavy-bet game has been superseded by other games, notably craps (*see* Dice). Roulette is a banking game, and all bets must be placed against the bank (proprietor of the game); as a rule it is very fairly conducted. As many players may bet as can get near the table.

Equipment for roulette consists of a large oblong table, in the centre of which is mounted a compartmented wheel, and at either end of which there is a red and black layout, usually enameled on green cloth. Small portable wheels of relatively low price are available for home use. The original French terminology of roulette has been replaced in English-speaking countries by equivalent English terms, and both will be used in this description.



EUROPEAN ROULETTE WHEEL WITH 37 COMPARTMENTS

Numbers above the white panels are red, other numbers are black, except zero, which is green

The game begins when the *tourneur*, one of the croupiers in attendance who represents the house, calls, "Make your bets, gentlemen" (*Faites vos jeux, messieurs*), whereupon players place their bets on the layout to indicate the number, or classification of number, they hope will win. The *tourneur* then spins the wheel in one direction and in contrarotation spins a small ivory

ROULETTE CLOTH OR LAYOUT, EUROPEAN STYLE

ball which, when the wheel slows down sufficiently, falls into one of the numbered compartments, and thus designates the winning number. When it appears to the *tourneur* that the ball will soon come to rest, he calls, "The betting is closed" (*Rien ne va plus*). No bet may be placed thereafter.

When the ball rests, the *tourneur* announces the winning number and whether it is red or black, odd or even, low (1 to 18) or high (19 to 36). The bank pays winning bets at the established rates (*see* below) and collects all losing bets, which a croupier gathers in with a rake.

For a winning bet on red (*rouge*), black (*noir*), high (*passe*), low (*manque*), even (*pair*) or odd (*impair*), the bank pays "even money"—the amount of the bet. For a winning bet on the dozen (1 to 12, 13 to 24 or 25 to 36) in which the number falls, the bank pays 2 to 1; these bets are indicated on the layout as 12^{p}, 12^{m} and 12^{d} (respectively, *première, milieu* and *dernière douzaine*). Likewise, the bank pays 2 to 1 for a winning bet on the column in which the number lies.

Other bets, and the rate of payment when they win, are: (1) on a single number (*en plein*), 35 to 1; (2) on two numbers (*à cheval*), if either wins, 17 to 1. Such a bet is placed on the line between the two numbers. A bet may be made *à cheval* on two adjacent columns, or two adjacent dozens, and pays $\frac{1}{2}$ to 1. (3) On three numbers (*transversale pleine*), if any wins, 11 to 1. A bet on 4, 5 or 6 would be indicated by placing a coin on the line between 4 and *passe*, or between 6 and *manque*. (4) On four numbers (*en carré*), if any wins, 8 to 1. A bet on the point of intersection between 14, 15, 17 and 18 would be a bet on those four numbers. (5) On six numbers (*transversale six*), if any wins, 5 to 1. A bet on the point of intersection between 15, 18 and *impair* would be a bet on 13, 14, 15, 16, 17 and 18.

The zero may be placed *à cheval* with any adjoining number; or *en carré* (but called *quatre premiers*) with 1, 2 and 3; or in combination with 1 and 2, or with 2 and 3.

The advantage of the bank arises when the zero shows. Only bets on the zero *en plein* or in combination with 1, 2 and 3 are paid; all other bets are collected. Thus the bank should win one part in 37, or 2.7%, of all bets made against it.

At Monte Carlo, and in a few other casinos, this advantage is reduced by almost one-half in the case of the even-money bets. When the zero occurs, the player who placed such a bet may let the bank take half his bet (*partager*) or may have the bet put "in prison," to be decided on the next coup; whereon if the player wins he may withdraw his bet but is not paid in any case.

In distinction to this practice, many American gambling houses have roulette wheels with 38 compartments including both a zero and a double zero (00) and if either of them occurs all bets are taken except those involving the winning zero. The bank's advantage is thus increased to 5.26%. Finally, some wheels (seldom seen except in the smaller U.S. gambling houses and in Mexico) have 0,00 and an eagle (equivalent to a third zero), giving the bank an advantage of 3 parts in 39, or 7.7%.

There is little possibility of the exercise of skill in roulette, though a certain judgment is advisable in betting; it would, for example, be unwise to place a bet on red and also on the number 17, which is black, for if one bet wins the other must lose.

Many books have been published on roulette, most of them being devoted to demonstration that no system of betting can be expected to win against the bank in the long run.

ROUMANIA: *see* RUMANIA.

ROUND: *see* CATCH.

ROUNDERS, an old English game which has never become a seriously competitive sport, although it may be an ancestor of baseball (*see* BASEBALL: *History of Baseball*). The earliest written reference to rounders was made in *A Little Pretty Pocket-Book* (1744), in which a woodcut also shows the children's sport of "baseball," and a letter of Nov. 8, 1748, of Mary Lepell, Lady Hervey, refers to the prince of Wales' family's "diverting themselves at Baseball." *The Boy's Own Book* (2nd edition, 1828) gives rounders a chapter and notes that in London the game is called "feeder." In 1889 the National Rounders Association of Liverpool and the Scottish Rounders Association were formed. The National Rounders Association was formed in 1943.

A hard ball, weighing $2\frac{1}{2}$ to 3 oz. and measuring $7\frac{1}{2}$ in. in circumference, and a round wooden "stick," measuring not more than $6\frac{3}{4}$ in. round the thickest part, not more than 18 in. in length and not weighing more than 13 oz., are used. The playing field is marked in the form of an open irregular pentagon (*see* diagram). The bowler must deliver the ball below the head but above the knee of the batsman and over the batting square. The batsman must strike at a good ball and attempt to run a "rounder" (even if he misses the ball or fails to strike at it) in a counterclockwise direction round the first, second, and third posts and so home to the fourth post, though he may stay at any of the first three. Three consecutive bad balls secure half a rounder for the batsman. He is out if the ball is caught on the fly; if the base (post) to which he is running is touched with the ball; or if while running he is touched with the ball by a fielder. As in cricket, the ball may be hit in any direction; but if it goes behind the batting square, the batter may run only to first post until the ball has been thrown back past the square. Nine players constitute a side, and two innings apiece are played in each match. The usual, but not compulsory, disposition for a fielding side is the bowler, the backstop (catcher), a base man on each of the four bases, and three deep fielders. There are two umpires.

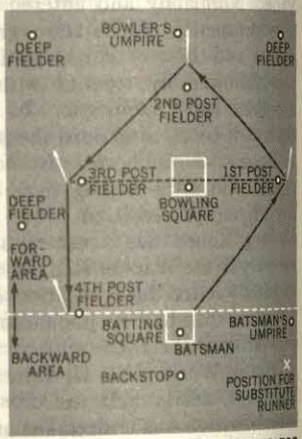

DIAGRAM OF THE PLAYING FIELD FOR ROUNDERS, SHOWING POSITIONS OF PLAYERS

The game is played in Great Britain among younger schoolchildren, and some business houses and youth clubs have regular matches. (N. D. MCW.)

ROUNDHEAD, a term applied to the adherents of the parliamentary party in England during the Civil War (1642–51). Some of the Puritans wore the hair closely cropped round the head, and there was thus an obvious contrast between them and the men of fashion with their long ringlets. "Roundhead" appears to have been first used as a term of derision toward the end of 1641 when the debates in Parliament on the Bishops Exclusion bill were causing riots at Westminster. John Rushworth, *Historical Collections*, part 3, vol. 1, p. 463 (1692), claims the word was first used on Dec. 27, 1641, by a disbanded officer named David Hide, who during a riot is reported to have drawn his sword and said he would "cut the Throat of those Round headed Dogs that bawled against Bishops." Richard Baxter (*Reliquiae Baxterianae*, 1696) ascribes the origin of the term to a remark made by Queen Henrietta Maria at the trial of the earl of Strafford (March–April 1641); referring to John Pym, she asked who the round-headed man was. The name was still in use at the Revolution of 1688.

ROUND TABLE, the celebrated table of King Arthur (*q.v.*). The first mention of the Round Table is in the *Roman de Brut* by Wace (*q.v.*), in which Arthur has a round table made at which none of his barons can claim precedence over the others. According to Wace, the Bretons told many stories about this table. In

Layamon's expanded version of this romance, the *Brut* (*c.* 1200), there is a violent quarrel among the knights, apparently because there are numerous tables and all want to be served at the most honourable. A Cornish carpenter then makes Arthur a table at which more than 1,600 men can sit and which Arthur can nevertheless carry about with him. Early Welsh literature knows nothing of Arthur's Round Table and in the absence of evidence it is idle to speculate about the source of the accounts in Wace and Layamon, especially where so simple a *motif* is concerned. Layamon's extended narrative has been widely regarded as a reflection of Celtic (*i.e.*, Irish) stories of feasts in which quarrels about precedence arise, but the details of the brawl could just as well have been suggested by Germanic heroic poetry.

The literary importance of the Round Table lies in the fact that in the French romances it provides the knights of Arthur's court with a name and a collective personality. The idea of a fellowship of the Round Table is still inconspicuous in the Arthurian romances of Chrétien de Troyes (*q.v.*), and it is only in the prose romances of the 13th century that the fellowship becomes comparable to, and indeed in many ways the prototype of, the great orders of chivalry founded in the later Middle Ages. This conception culminates in the *Morte Darthur* of Sir Thomas Malory (*q.v.*), for whom the notion of chivalry is inseparable from that of a great military brotherhood established in the household of a great prince.

In the peculiar Messianic Grail poem of Robert de Borron, *Joseph d'Arimathie* (*c.* 1200?), Joseph is commanded to make a table in commemoration of the Last Supper and to leave one place empty to symbolize the seat of Judas. This seat cannot be occupied without peril except by the destined Grail-hero. In his *Merlin*, Robert relates that Merlin constructed a table for Uther Pendragon modeled on Joseph's Grail table, with a place left vacant in the same way. When, in the 13th century, in the group of prose romances covering all the Arthurian stories and known as the "Vulgate cycle and the post-Vulgate romance," the Grail story is fully integrated with the legend of Arthur, the Round Table *motif* attains its "classical" form: the Round Table is made for Uther by Merlin and comes into the possession of Leodegran, king of Carmelide, who gives it to Arthur together with a company of knights when the latter marries his daughter Guinevere. The order of the Round Table is now a formal order of knighthood, admission to which is reserved for the most valiant, and the Siege Perilous is left vacant waiting for the coming of the strange figure of Galahad who will bring the marvels of Arthur's kingdom to an end. (*See* also ARTHURIAN LEGEND; GRAIL, THE HOLY.)

The existence of a round table at Winchester in the 15th century is attested by William Caxton (1485) and John Hardyng, who says in his *Chronicle* (*post* 1464) that the Round Table "began at Winchester and ended at Winchester, and there it hangs still." The tabletop 18 ft. in diameter and divided into 25 sectors which is now fixed to the wall of the great hall was, according to R. S. Loomis, perhaps constructed in the late medieval period for one of those feasts followed by a tournament and known as *tables rondes*, so common at the time. The present form of the table, with its alternate sectors of green and white (the Tudor colours), its central Tudor rose, and the names of the knights based on Malory, cannot be earlier than the reign of Henry VII.

Micha, "La table ronde dans Robert de Boron," in *Les Romans du Graal, Colloques internationaux du Centre national de la Recherche scientifique*, no. iii (1956).

(F. WH.)

ROUNDWORM (NEMATODE), the name for invertebrate animals that constitute the phylum Nemata (some regard them as a class, Nematoda, of the phylum Nemathelminthes). The terms nema or nematode mean "threadlike," the reference being to the elongate threadlike body typical of the group. Free-living and plant-parasitic nematodes are often called eelworms or anguillules, terms descriptive of the body form and locomotion of some roundworms. Included among the nematodes parasitic in animals are the intestinal roundworms, pinworms, hookworms, filarial worms, trichina worms and whipworms.

Free-living and parasitic forms are mostly from $\frac{1}{32}$ to $\frac{1}{64}$ in. long, rarely larger or smaller; however, they are so thin that they are not usually seen without the aid of a microscope. Certain nematode parasites are much larger: *Ascaris*, intestinal parasites of man, may be 10 in. long and $\frac{1}{4}$ in. in diameter; mermithid parasites of insects, several inches long; kidney worms of dogs, up to 1 yd. The largest known form, *Placentonema gigantissima*, in the placenta of an arctic whale, may reach 9 yd. long. Most roundworms are spindle-shaped or filiform, but some may be sausage-shaped (insect parasites like *Howardula, Tylenchinema*); spherical, subspherical, lemon-shaped, pear-shaped (females of sedentary plant parasites, such as *Heterodera, Meloidogyne*); kidney-shaped (*Rotylenchulus*, ectoparasites on roots) or pouch-shaped (female of *Tetrameres*, a parasite in the proventriculus of the chicken).

In colour, roundworms are usually whitish to yellowish brown, exceptionally red (female kidney worm of dogs), black (*Siphonolaimus*, marine; *Dorylaimus atratus* from hot springs) or rarely other colours. Many species are transparent, others opaque.

Nematodes differ from other nemathelminthes in having a body wall that is a cuticular-hypodermal-muscular tube with longitudinal hypodermal ridges (chords) separating the bands of body muscles; a complete absence of cilia; a ring-shaped, circumesophageal nerve centre, with six radially (one each lateral and submedial) arranged nerves extending toward the head end and a usually unpaired main ventral nerve extending toward the tail; lateral chemoreceptors (amphids, or lateral organs) on or near the head; radially arranged circumoral tactile head sense organs; an absence of nephridial flame cells; and a cloaca in the male.

OCCURRENCE AND SIGNIFICANCE

Occurrence.—About 10,000 species of nematodes have been described (this number is thought to be only a fraction of the existing species). Nematodes occupy a great variety of habitats. Free-living species are so numerous in soils that a handful of earth often contains hundreds of individuals of several different species; they live in fresh-water streams and ponds, in brackish and salt water and have been found at all latitudes where a search for them has been made. Agricultural soils contain hundreds of millions of free-living nematodes and often large numbers of plant-parasitic species; the same is true of forest and grass lands. Man and all of his domestic animals are often parasitized by a large number of nematode species; wild animals and insects and other invertebrates also have a large variety of nematode parasites. In general, nematodes are found wherever they can find enough food to survive. They are certainly one of the most abundant

groups of multicellular animals, but because of their small size and hidden habitats they are seldom seen unless a special search is made to find them.

Plant Parasites.—All the several hundred species of nematodes demonstrated to be plant parasites belong to two orders: most are in the Tylenchida; only a few species are in the Dorylaimoida (*see* classification below). The great majority feed on the underground parts of plants (roots, tubers, corms, rhizomes and bulbs); only a relatively few species feed on the stems, leaves

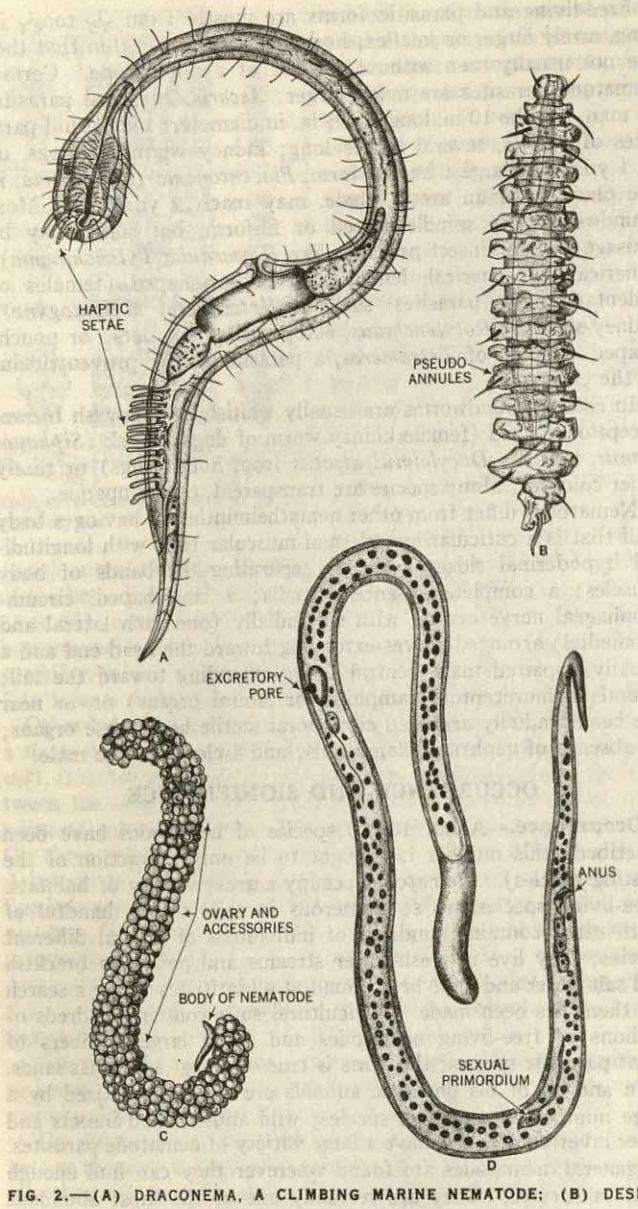

FIG. 2.—(A) DRACONEMA, A CLIMBING MARINE NEMATODE; (B) DESMOSCOLEX, A MARINE NEMATODE WITH PSEUDOANNULES; (C) SPHAERULARIA, PARASITE OF BUMBLEBEE; (D) MICROFILARIA OF WUCHERERIA BANCROFTI, A PARASITE OF THE HUMAN LYMPHATIC SYSTEM

and flower parts of plants. Apparently all of the higher plants without exception are attacked by plant-parasitic nematodes. Nematode species are somewhat specialized so far as feeding and reproducing are concerned. For the most part they are obligate parasites, and a given species will be able to reproduce only on a more or less limited variety of plants.

Most information available relates to agricultural crops, and known host ranges of some of the species that have been extensively studied range from a few related plant species to many plant species of different families. Very often a given nematode species is able to reproduce on certain cultivated varieties of plants, known as "susceptible," but not on other cultivated varieties, known as "immune," with all degrees of resistance between the two categories.

Plant-parasitic nematodes are serious agricultural pests, responsible for an estimated billion dollars of crop damage in the United States each year. The greater part of this loss is from reduction of yields due to root damage by nematodes, often in association with bacteria and fungi, which weakens the plant. Some of the loss is due to reduction in quality of produce because of malformation (distorted potato tubers, carrots, etc.).

Some plant-parasitic nematodes cause the formation of galls. The attached tissue enlarges, root growth may stop (resulting in an abnormally reduced root system) or cells may die. Often the nematode damage is extended by bacteria or fungi that secondarily invade the attacked tissue. Nematodes also transmit several virus diseases of plants.

Plant-parasitic nematodes are controlled in agricultural soils by crop rotations, which take advantage of the specialized feeding habits of the nematodes. The parasites are starved out by planting crops on which they cannot reproduce. The same thing can be accomplished by leaving the land fallow for a time. For crops of high value it is possible and economical to use chemical control. Nematocides (or nematicides) in common use include dichloropropenes, ethylene dibromide, dibromochloropropane and methyl bromide.

Animal Parasites.—Roundworms, however, have been best known as parasites of animals, particularly as disease agents of man and domesticated animals. Practically all organs and body parts—intestine, liver, kidney, lungs, diaphragm, brain, eyes, blood, heart—have their specific nematode parasites. About 60 different species have been observed in man, about 70 in horses, 40 in pigs and similar numbers in other mammals, birds (chickens, about 60), reptiles, amphibians, fishes, insects and other arthropods, mollusks, earthworms, echinoderms, leeches, etc.

Human Disease.—Roundworms are a most significant factor in human health and the welfare of domesticated and game animals. Infections in man are of worldwide occurrence. The whipworm (*Trichuris trichiura*), relatively harmless, has been estimated to be infecting more than 335,000,000 persons. The trichina worm (*Trichinella spiralis*), often a dangerous parasite, has been stated to affect annually more than 20,000,000 persons in the United States and Canada, more than 1,000,000 in South America, almost 4,000,000 in Europe, perhaps 200,000 in Africa and 100,000 each in Asia and the Pacific (*see* TRICHINOSIS). Infestations of hookworms (*Ancylostoma duodenale, Necator americanus*), said to affect more than 500,000,000 inhabitants of the warmer regions of the earth, were mentioned in Egyptian papyrus records of earliest history (*see* HOOKWORM). Another parasite of man, *Strongyloides stercoralis*, also is an inhabitant of the tropics and subtropics; it is estimated to affect some 35,000,000 persons, mostly in America and Southern Asia. The intestinal worms, *Ascaris*, too, have been referred to in ancient medical scripts. They are cosmopolitan and are estimated to be present in almost 650,000,000 persons, causing a variety of often serious disease symptoms, including allergies. The pinworm (*Enterobius vermicularis*), of widest distribution, occurring in certain locations in 50% to 100% of the population, also is mentioned in early medical writings. Filarial worms affect man mostly in the tropics. They are remarkable because their life cycles require an intermediate host, either a mosquito or a bloodsucking fly. The medically most important filariae are *Wuchereria ban-*

BY COURTESY OF G. STEINER

FIG. 4.—GLOBULAR FEMALES OF GOLDEN NEMATODE (HETERODERA ROSTOCHIENSIS) ON POTATO ROOT

crofti, *W. malayi*, *Loa loa* and *Onchocerca volvulus*, in all of which the larval stages (microfilariae) live in man's bloodstream. Elephantiasis, an abnormal swelling of various parts of the human body, particularly legs, arms and the scrotum, is a late development of a filarial infection (*see* FILARIASIS). The guinea worm or medinaworm (*Dracunculus medinensis*) is another remarkable roundworm, estimated to affect 50,000,000, particularly the people of the Nile and India; it too has been reported in earliest medical papers (*see* GUINEA-WORM INFECTION).

Free-Living Nematodes.—The over-all role of free-living nematodes is intimately connected with the soil and the life therein: bacteria, fungi, algae and protozoa. There are no proper planktonic nematodes nor forms that are truly aerial; nematodes occur in these environments only as parasites, commensals or passengers on other organisms. These nematodes, neither plant nor animal parasites, include forms that normally live in soil, fresh water, salt water or in such habitats as crevices in trees. Probably the best-known of the free-living nematodes, though not a typical one, is the "vinegar eel," capable of living in vinegar or other similarly acidic environments. The food of free-living nematodes is not well defined. Certainly some live on bacteria or other organisms associated with the decay of organic matter, others live on algae and some kill and feed on other small animals, including other kinds of nematodes.

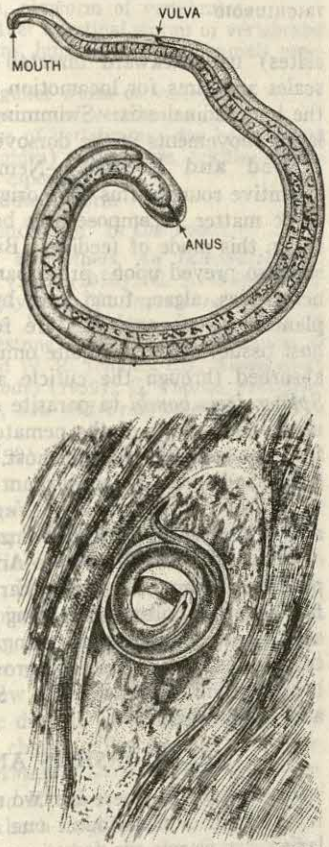

FIG. 5.—TRICHINA WORM: (TOP) FEMALE OF TRICHINELLA SPIRALIS; (BOTTOM) YOUNG TRICHINELLA EMBEDDED IN MUSCLE OF HOST

Value.—Roundworms are also useful to man. Through their parasitism, or through their ability to transfer pathogenic bacteria, they help control such noxious pests as Japanese beetles, grasshoppers and bark beetles.

In basic biological science nematodes have been favoured forms for the study of cell division, cell lineage, sexual phenomena, the problem of heat and cold resistance of living matter, and the unsolved features of dormancy and parasitism. Research questions have been raised by the discovery of certain terrestrial nematodes withstanding temperatures as low as −271° C. and by the observation of wheat gall nematodes and some related kinds returning to life after a dormancy of many years (*Tylenchus polyhypnus* resumed life after 39 years).

STRUCTURE AND FUNCTION

Like other nemathelminths, roundworms have an unsegmented, often cylindrical body with a pseudocoel; *i.e.*, a body cavity without an epithelial wall of its own between the intestinal tract and the outer body wall.

Body Covering.—This is a resilient cuticula, richly structured, smooth or annulated; in many free-living types thick and articulated but also with numerous surface formations: membranous projections, inflations, folds, cordons, spines and warty or scale-like structures. The lateral surface is often marked by wings, grooves, areolations or striae that interrupt the body annulation. The cuticula may bear bristles or setae, papillae or outlets of hypodermal glands. Beneath the cuticula is a usually syncytial hypodermis (epidermis) that forms four longitudinal thickenings or chords (two lateral, a ventral and a dorsal) or, exceptionally, six (two additional ventrosubmedial) or eight chords (two additional dorsosubmedial). Lateral chords are the strongest and have the largest number of nuclei, the ventral one being smaller, the dorsal and submedial ones smallest. Cuticula, hypodermis and chords form the exoskeleton.

Musculature.—Arranged between the chords are longitudinal muscles. With the exoskeleton, they constitute the tubelike outer body wall. Additional muscles are present particularly in the digestive tract and in the male copulatory system. Circular muscles are absent.

Body Cavity.—The pseudocoel between the outer wall and the intestinal tract is filled with fluid that maintains a proper turgor pressure. Strands of mesenchymatic tissue, fenestrated membranes and cells called pseudocoelomocytes may occur in the body cavity.

Digestive Tract.—Anteriorly, the terminal, or rarely subterminal, mouth leads to a variously shaped buccal cavity that may or may not have teeth and other armature, may be transformed into a stylet or may be absent. A tubular esophagus, with three radiating branches, and digestive glands connect the mouth and intestine, usually through an esophageo-intestinal valve. The intestine, with an epithelial wall, ends in a rectum, with or without rectal glands; the anus is ventral and subterminal, seldom terminal.

Nervous System.—This system consists of a circumesophageal central organ or nerve ring (a kind of brain) with various ganglia; six nerves, one each lateral and submedial, extend from the nerve ring anteriorly and innervate the radially arranged tactile labial and cephalic papillae or setae and the amphids. Posteriorly from the nerve ring there extend in each pertaining chord, a main ventral and lesser dorsal and lateral nerves. Some fresh-water and marine forms are provided with primitive eyes.

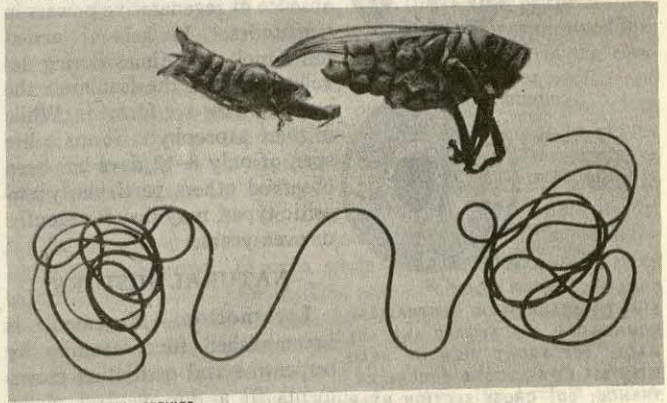
Respiration.—There is no specific respiratory-circulatory system. Respiration occurs through the cuticle, even in parasites that are embedded in host tissue. In contrast, intestinal parasites living in the digestive food mass may respire anaerobically.

Excretory Apparatus.—The excretory system is unique, consisting of either an H- or inverted U-shaped canal system located in lateral chords, with a ventral pore usually in the anterior third of the body in the region of the nerve ring; or this canal system may be combined with ventrally located glands. There may be no canal system, but only one to several ventral glands. In some cases a specific excretory apparatus is not known. The canal system is considered a remnant of a protonephridial excretory apparatus, but in no instance has the presence of flame cells been definitely established.

Additional Glandular Systems.—The esophageal glands, mainly digestive in function, are also used as poison glands to immobilize prey. In plant parasites the secretions of these glands, when injected into host tissues, induce hypertrophies and production by the plant host of assimilable food material (perioral digestion). Foot glands, commonly located in the tail of mainly aquatic free-living types, are adhesive.

REPRODUCTION AND DEVELOPMENT

Reproductive System.—The female has a single, ventrally located vulva that may open in middle region of the body, in positions farther forward (exceptionally near the head) or more frequently



BY COURTESY OF G. STEINER

FIG. 6.—A MERMITHID ROUNDWORM DISSECTED FROM A GRASSHOPPER

farther backward, but always in front of the anus (exception: *Randonia randoni*, a fish parasite with the vulva and rectum combined into a cloaca). The vagina is commonly a short, inward-leading tube that connects with the outlets of the two ovaries, one directed forward, the other backward. The oviduct and uterus are frequently complex structures. In many nematodes the posterior, less frequently the anterior, ovary and outlets are wholly or partly obliterated. Multiple ovaries and outlets are rare.

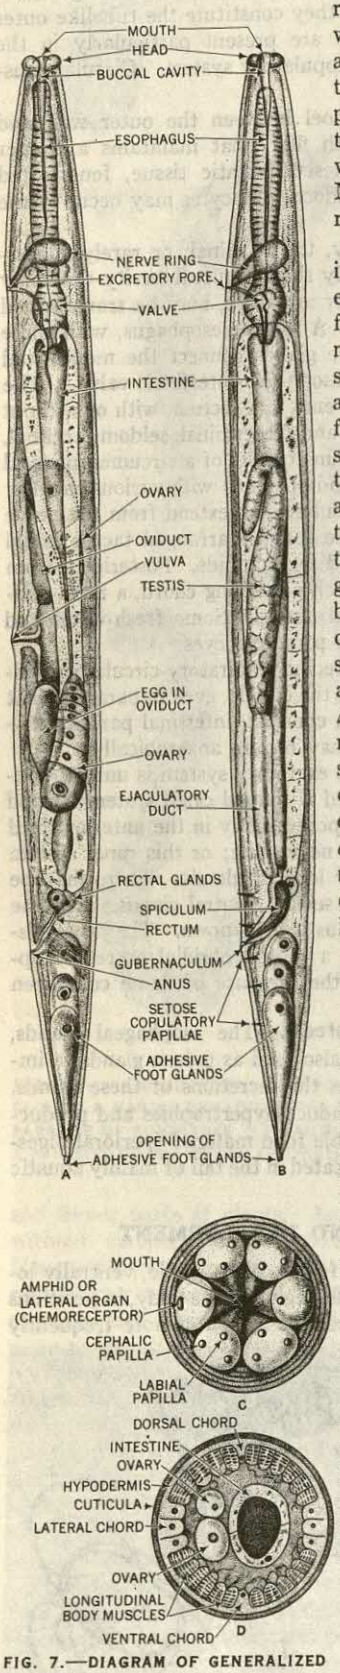


FIG. 7.—DIAGRAM OF GENERALIZED ROUNDWORM (A) FEMALE AND (B) MALE; (C) FRONT VIEW OF HEAD WITH SIX LIPS AROUND BUCCAL ENTRANCE; (D) CROSS SECTION NEAR MIDBODY OF FEMALE

The male organs, the testis and its outlet, extend forward but empty in the rectum, always forming a cloaca. Sclerotized, mostly curved, usually paired, seldom single spicula function as copulatory organs; of diverse form in the various groups (absent, *e.g.*, in some *Trichiuroidea*), they are inserted into the vulva and vagina of the female. Additional structures, such as sclerotized gubernacula, setae, papillae, glands, special muscles and membranes (bursal) are further aids in copulation. Males are often smaller than females and may also differ in many other respects. Although the condition of separate sexes prevails, parthenogenesis and hermaphroditism also occur; here males are rare or apparently absent. In *Trichosomoides crassicauda*, a parasite of the urinary tract of the rat, the male dwells in the vagina of the much larger female roundworm.

Development and Life Cycle.—Free-living nematodes produce small numbers of eggs, while parasitic kinds are extremely prolific (an *Ascaris* generates about 27,000,000 eggs in its lifetime; about 200,000 daily). Cleavage is determinate, and cell constancy is a remarkable feature in nematodes. After termination of the larval development, the cell number remains constant, except in the gonads; further growth is accomplished only by cell enlargement. This is associated with the absence of regenerative powers in nematodes. In general nematodes molt four times during development; at the last molt the sexual organs are formed. While in some saprophytic forms a life span of only 8–12 days has been observed, others, particularly parasitic types, may live for months or even years.

NATURAL HISTORY

Locomotion.—Movement is accomplished fundamentally by serpentine and oscillating movements in a dorsoventral plane, through alternating contraction of the subventral and subdorsal bands of body muscles. A unique feature is the use in some species of one of the lateral, not the ventral, sides as a creeping surface. However, certain marine groups, *e.g.*, the *Epsilonematidae*, move like geometrid caterpillars with the ventral side of body turned toward the substratum; *Draconematidae*, climbers, also apply the ventral side against the substratum; certain *Desmoscolecidae* walk on their backs, using stiff setae and pseudoannules as locomotory structures; some *Criconematinae* (root parasites) use backward directed annules and retrograde spines, scales and rims for locomotion by contraction and relaxation in the longitudinal axis. Swimming is performed by some by oscillating movements in the dorsoventral plane.

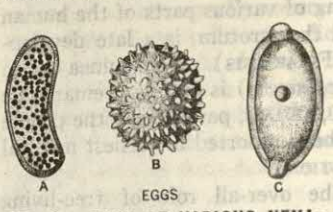

FIG. 8.—EGGS OF VARIOUS NEMATODES (GREATLY MAGNIFIED): (A) MEADOW NEMATODE (PRATYLENCHUS); (B) MONOCHUS; (C) A TRICHIUROID

Food and Feeding.—Nematodes are sucking organisms. Primitive roundworms were originally feeders on bacteria and organic matter decomposed by bacterial action; many types still retain this mode of feeding. But other kinds of microorganisms are also preyed upon: protozoans, rotifers, annelid worms, other nematodes, algae, fungi and, by parasitism, many animals and plants. Some nematodes are food specialists, requiring definite host tissue; others are quite omnivorous. Food may be ingested; absorbed through the cuticle as in many parasites; or, as in *Sphaerularia bombi* (a parasite of the bumblebee), the prolapsed uterus and ovary of the nematode may assimilate food directly from the hemolymph of the host. Parasitic nematodes in intestinal tracts and forms living in plant digestive fluids, as in leafy containers of the pitcher plant *Nepenthes*, are immune to digestive action because of protective enzymes.

Enemies and Diseases.—Amoebas, earthworms, tardigrades, predatory nematodes, mites, carnivorous insects, crustaceans and fish have been observed feeding on nematodes. Most fascinating are the nematode-trapping fungi that catch their prey with contractile loops and sticky outgrowths. Nematodes are subject to bacterial and fungus diseases. Sporozoan infections are common and usually lethal.

RELATIONSHIPS AND CLASSIFICATION

Phylogeny.—There are two main concepts of the phylogenetic relationship of nematodes: one assumes their origin from turbellarian flat worms via forms resembling gastrotrichs, tiny aquatic bottom dwellers; the other traces nematode origin from annelid ancestry via forms resembling rotifers.

FIG. 9.—NEMATODES CAPTURED BY A PREDACEOUS FUNGUS. THE RINGS ON THE FUNGAL HYPHAE CONSTRICT WHEN A NEMATODE PASSES THROUGH AND FUNGUS THEN ABSORBS BODY JUICES OF THE NEMATODE

Classification.—Authorities disagree on the taxonomic rank of the nematodes. Some regard them as constituting an order or a class of the phylum Nemathelminthes (as treated here), while others consider them a phylum, Nemata. The classification of lower groups is likewise unsettled, particularly as to superfamilies, orders and subclasses. The classification of the animal parasites is more advanced than that of the free-living and plant parasitic forms.

The following classification, by L. H. Hyman, is one of several schemes in general use. The first seven orders are mostly free living. The remaining orders include the economically important parasitic nematodes.

Order Enoploidea, chiefly marine
" Dorylaimoidea, common in soil and fresh water
" Mermithoidea, parasitic juvenile stage in invertebrates; free-living adults
" Chromadoroidea, chiefly marine
" Araeolaimoidea, soil and fresh water
" Monhysteroidea, marine and soil
" Desmoscolecoidea, marine
" Rhabditoidea (Anguilluloidea), eelworm, plant parasites
" Rhabdiasoidea, lung nematodes of amphibians and reptiles; intestinal parasites in mammals
" Oxyuroidea, threadworm, pinworm of vertebrates
" Ascaroidea, ascaris and other intestinal worms of vertebrates
" Strongyloidea, hookworms, lung worms of mammals especially
" Spiruroidea, eye worm, gullet worm of vertebrates
" Dracunculoidea, guinea worm of vertebrates
" Filarioidea, filarial worms of vertebrates; dog heart worm
" Trichuroidea (Trichinelloidea), whipworm, trichina worm of birds and mammals especially
" Dioctophymoidea, dog kidney worm

ROUS, FRANCIS (1579–1659), though an Independent and a layman, was the author of a metrical version of the Psalms which was approved by the Westminster Assembly and authorized by Parliament. It became the staple form of praise in worship in the Church of Scotland, where (in a revised form) it is still in use. Rous was born at Dittisham, Devon, and educated at Broadgates Hall, Oxford, and Leiden University. From 1625 until 1657, whenever Parliament was in being, he was a member, and of the Nominated Parliament of 1653 he was speaker. In 1657 he was summoned by Cromwell to the new House of Lords. From 1644 he was also provost of Eton. He died at Acton in January 1659 and was buried in Eton College chapel. The title of his book, *The Mystical Marriage: or Experimental Discourses of the Heavenly Marriage Between a Soule and Her Saviour,* which was issued more than once in his lifetime, in both English and Latin, well expresses his piety. He turned increasingly toward a light within: "We want not the Glow-worm of demonstration." (G. F. N.)

ROUSSEAU, HENRI JULIEN FÉLIX, called LE DOUANIER (1844–1910), French painter famous for his "primitive" or untutored style, was born at Laval, Mayenne, May 20, 1844. A soldier in Mexico in 1862–66, he served intermittently till 1871 when he entered the customs service (hence the title Le Douanier or customs official), but retired in 1885, at the age of 41, to professionally adopt his hobby of painting. He then began to exhibit portraits, still-life paintings and views of Paris and its people, such as "Un Soir de Carnaval" (1886; L. E. Stern collection, U.S.), "Myself: Portrait-Landscape" (1890; Prague) and "The Centenary of Independence" (1892). These are deceptively simple and arranged frontally with clear contours separating fields of even, solid, often brilliant colour; but their strength lies in their wholehearted regard for the occasion they represent. Between 1886 and 1890 Rousseau exhibited 20 works at the Paris Salon des Indépendants and was attacked by critics both "advanced" and orthodox. But he was defended by Degas and Toulouse-Lautrec, and later was befriended by Picasso and the poet Alfred Jarry. After 1890 his work became less static and included jungle and animal scenes. Some landscape studies are unexpectedly tentative and atmospheric; large works such as the "Sleeping Gipsy" (1897; Museum of Modern Art, New York city) have an imaginative, remote lyricism which later recommended them to Jean Cocteau and Guillaume Apollinaire. Some of Rousseau's best work dates from 1900 on; it includes "Jungle With a Lion" (1904–06; Museum of Modern Art) and "The Cart of Père Juniet" (1908; Mme. Paul Guillaume's collection, Paris). He died in Paris, Sept. 4, 1910.

ROUSSEAU, JEAN BAPTISTE (1671–1741), French poet, who enjoyed great renown in his day, was born at Paris on April 6, 1671, of humble parentage. As a young man he began to move in literary circles and received some encouragement from Boileau. Rousseau wrote a number of plays of which *Le Flatteur* (1696) was the most successful, several cantatas (an original genre in France), and many poems, some of them serious and reflective, like his ode to La Fare, others frivolous and even scandalous. The libellous character of some of these involved him more than once in trouble. In 1712, because of defamatory couplets which he denied having written, he was expelled from France. He remained in exile until his death in Brussels on March 16 or 17, 1741. He was a member of the Académie des Inscriptions.

See H. A. Grubbs, *Jean-Baptiste Rousseau* (1941). (RT. S.)

ROUSSEAU, JEAN JACQUES (1712–1778), French-Swiss moralist whose writings are among the most influential of the 18th century in political and social theory and literature, was born at Geneva, Switz., on June 28, 1712. His ancestor, Didier Rousseau, a convert to Calvinism, had taken refuge in Geneva in the middle of the 16th century, and Jean Jacques belonged to the fifth generation of his descendants. His mother, Suzanne (*née* Bernard) died a few days after his birth. His father Isaac, a watchmaker, an affectionate but irritable and feckless man, looked after him until he was ten years old, giving him no regular schooling but encouraging a precocious taste for Plutarch and for novels. In June 1722, Isaac, after a quarrel with a fellow citizen in which he was probably the aggressor, had to take refuge at Nyon in the Pays de Vaud, leaving his two sons, Jean Jacques and his elder brother François, in the charge of their maternal uncle, Gabriel Bernard. François was apprenticed, and Jean Jacques sent to live with Pastor J. J. Lambercier at Bossey, near Geneva. He returned from Bossey to his uncle in Geneva in Sept. 1724 and was soon afterward set to work as a clerk to J. L. Masseron, a notary, with whom he stayed only a few weeks. In April 1725 he was apprenticed to Abel du Commun, an engraver, with whom he stayed until he fled from Geneva on March 14, 1728. In his *Confessions* Rousseau complains that du Commun treated him brutally, though he admits his own idleness, untruthfulness and dishonesty, which he ascribes to his master's harshness. He felt humiliated and was made rebellious by his master's punishment, but earlier Mlle Lambercier at Bossey had had to give up beating him because he had enjoyed it too much. Fierce resentment at injustice and masochism were both strong motives with him.

His Formative Years.—From Geneva Rousseau found his way to Annecy, in Savoy, to Mme de Warens (Louise Éléonore de Latour de Pil), who had left her husband and become a convert to Catholicism, receiving a pension from the king of Sardinia for helping to make other converts. Through Mme de Warens he was sent to Turin, to the Hospice of the Holy Spirit, which he entered on April 12, 1728. According to the register of the hospice, he abjured the heresies of Calvin on April 21 and was received into the Roman Catholic Church two days later, though in the *Confessions* he describes a much longer resistance to conversion and says that he finally succumbed in order to escape the pernicious moral atmosphere of the hospice. For several months he stayed in Turin working as an engraver and as a lackey. He returned to Mme de Warens in the spring of 1729 and was sent for a time to a Lazarist seminary, but he soon found that he had no vocation for the priesthood and later went to the choir school attached to the cathedral at Annecy. In 1730, while Mme de Warens was away in Paris, he returned to Switzerland and set himself up at Lausanne and then at Neuchâtel as a teacher of music (though he had no proper qualifications). After several months of vagabondage and precarious living, he was sent to Paris in the autumn of 1731 by the marquis de Bonac (Jean Louis d'Usson), the French ambassador at Soleure. This first visit to Paris led to nothing and lasted

only a few days. Rousseau returned on foot to Mme de Warens, who by this time had moved to Chambéry. She offered herself to him as his mistress in 1733, saying that she thought it would be good for him, and he accepted, though he continued to feel himself more her son than her lover and knew that he would have to share her favours with her steward, Claude Anet. Except for occasional journeys to Switzerland and France, he stayed with her, either at Chambéry or in the country nearby, at a house called Les Charmettes, until 1740. It was during this time that he became a diligent but unsystematic reader and that he first began to write.

RADIO TIMES HULTON PICTURE LIBRARY

JEAN JACQUES ROUSSEAU. PASTEL PORTRAIT BY MAURICE QUENTIN DE LA TOUR, 1752

In May 1740 he went to tutor the children of M. de Mably, *prévôt des maréchaux* for the Lyonnais and elder brother of Etienne Bonnot de Condillac and of the abbé de Mably; but when his year's contract was over he was not asked to stay. He returned for a time to Mme de Warens, who received him coolly. Though she had begun to grow tired of him several years before and had acquired a new and younger lover, she had not lost all maternal solicitude for him, especially as he had been ill several times since 1737. He suffered from uremia and his condition grew worse as he grew older. In 1742 he went to Paris for the second time, taking with him a new scheme of musical notation, an opera, a comedy and a collection of poems.

Rousseau went to Paris seeking fame and fortune, but for years had no success. He was invited to read his scheme for musical notation to the Académie des Sciences but nothing came of it; he spent a year, from Sept. 1743 to Aug. 1744, in Venice as secretary to the French ambassador there, but quarrelled so violently with his master that he had to leave; he wrote a ballet, *Les Muses galantes*, which was eventually performed at the Opéra in Paris in 1747 but attracted only slight notice. On two occasions he was so deeply humiliated that he fell ill: once, when he declared his love to Mme Dupin, his protectress, who left the room and for a long time forbade him her house; and again, when an opera, with words by Voltaire and music by J. P. Rameau, whose score he had been asked to alter for a shortened version, was played at Versailles without his name being mentioned. Rousseau, at this period, devoted more of his energies to music and to the writing of comedies than to social and political matters. He lived in frequent, but not intimate or equal, contact with the rich and the famous. His best, perhaps his only true, friend was Denis Diderot, who commissioned him to write the articles on music for the *Encyclopédie*. He dined once a week at the Hôtel du Panier Fleuri with Diderot and with Condillac, and these were the happiest moments of an otherwise awkward and anxious period of his life. Early in 1745, soon after his return from Venice, he had taken up with Thérèse le Vasseur, a servant at the hotel where he was staying. He kept her for the rest of his life and had five children by her, who were all sent to a foundling hospital. In disposing of his children in this way, he was doing what was often done at that time and felt, so he says in the *Confessions*, no shame. He was poor and sickly and for years was heartlessly exploited by Thérèse's mother and some of her relatives. Later, after he had become famous as a moralist, he was morbidly sensitive about his abandoned children, and the emotional burden of a guilt that he would not admit helped in the end to put him out of his mind.

The Citizen and the Moralist (1749–62).—One day, toward the end of July 1749, Rousseau, on his way to Vincennes to visit Diderot who was in prison there, read in the *Mercure de France* that the academy of Dijon offered a prize for an essay on the question whether the revival of the sciences and the arts had helped to corrupt or to purify morals. Rousseau tells us, in his *Confessions*, that when he read that notice "he saw another world and became another man" and that when he reached Diderot he was so excited as to be almost delirious. Diderot urged him to compete for the prize and even (so some of his friends said afterward) suggested to Rousseau that he should treat the subject in an unexpected way, arguing that science and art had corrupted morals. Whether or not it was from Diderot that Rousseau got this idea (and Diderot never said that it was), the idea itself was more congenial to Rousseau than to his friend. It released emotions pent up within him for years. The result of the competition was announced in July 1750, and Rousseau got the first prize. His essay, subsequently known under the abbreviated title of *Discours sur les sciences et les arts*, was published at the end of the year, and he found himself famous. In his *Confessions*, he gives the impression that, soon after the publication of his first *Discours*, he decided abruptly to change his way of life, to give up all hope of fortune and of worldly success and always to remain poor and independent. Though the change was more gradual and hesitant than he afterward remembered it, it is true that he never, for all his fame, was a worldly success. He never sought riches and never allowed himself to be lionized. He resented both indifference and flattery; he wanted to be emotionally independent of others and yet felt a need for their affection and respect. Self-absorbed as he was, he demanded that others should feel toward him as he, though he did not know it, was incapable of feeling toward them.

Whatever he did, whether it was liked or disliked, seemed, for the rest of his life, to add to his fame. In 1752 he composed an operatic intermezzo, *Le Devin du village*, which was first performed at Fontainebleau before the court. Next day he was to be presented to Louis XV to receive a pension, but he refused to go, partly from pride, partly from shyness and partly because of his peculiar illness. That same year his comedy, *Narcisse*, was played at the Théâtre Français. Next year, the *Lettre sur la musique française*, in which he expressed a strong preference for Italian over French music, was widely and hotly discussed. In the summer of 1754 he visited his native Geneva, was well received there, became once again a Protestant and recovered his citizen rights. Early in 1755, he published his *Discours sur l'origine de l'inégalité parmi les hommes*, greatly superior in thought and argument to his first *Discours*, though the academy of Dijon, for which it was also written, gave it no prize; in the same year appeared also his *Discours sur l'économie politique* commissioned by Diderot for the *Encyclopédie*. In April 1756 he moved out of Paris to the Hermitage, a house near Montmorency placed at his disposal by Mme d'Épinay (*q.v.*), where he began work on his novel *Julie, ou la nouvelle Héloïse*. It was there that he fell genuinely in love, perhaps for the first time in his life, with Mme d'Houdetot, nearly 20 years his junior and herself in love with another man. Rousseau did not expect her to return his love but believed in her friendship; and his passion for her deeply affected his novel, which is as remarkable for eloquence and for subtlety as for the artificiality and even absurdity of many of its situations and attitudes. It is the novel of a man who has dreamed of love more than he has known it. Out of this unfortunate passion there arose misunderstandings with Mme d'Épinay, which quickly, other causes supervening, led Rousseau to break with her, with her lover Baron de Grimm and (saddest of all) with Diderot. It was then that he first gave obvious signs of the persecution mania from which he suffered, intermittently but with increasing severity, for the rest of his life.

In Dec. 1757 Rousseau moved to Montlouis, another house near Montmorency, at which he stayed until June 1762. This shelter he owed to the maréchal-duc de Luxembourg (Charles François de Montmorency) and his wife, who were among the most devoted, tactful and considerate of his powerful friends. At Montlouis he spent his most productive and in some ways his happiest years. In Oct. 1758, there appeared his *Lettre à M. d'Alembert*, commonly known as the *Lettre sur les spectacles*, against the establishment of a theatre at Geneva. This letter, criticizing an article on Geneva

written by d'Alembert for the *Encyclopédie,* marks his final breach with the coterie of the philosophers and contains in its preface a quotation from *Ecclesiasticus* deeply offensive to Diderot. At Montmorency he completed *La Nouvelle Héloïse,* which was published early in 1761 and was immediately and enormously popular. *Du contrat social* appeared in April 1762 and the first copies of *Émile,* a long treatise on education in the form of a novel, a month later.

Exile in Switzerland and in England (1762–67).—Both *Du contrat social* and *Émile,* which contains a long profession of faith (the "Profession de foi du vicaire savoyard") equally critical of dogmatic Christianity and of philosophical scepticism, were offensive to authority. An order was issued for Rousseau's arrest, and he was obliged to leave France, taking refuge at Môtiers-Travers in the territory of Neuchâtel, which was then subject to the king of Prussia and governed in Frederick II's name by Marshal Keith, a Jacobite in the Prussian service. Rousseau stayed at Môtiers from July 1762 to Sept. 1765 and found a good friend and protector in Marshal Keith. In 1763 he published the *Lettre à Christophe de Beaumont,* an attack on the archbishop of Paris who had condemned *Émile.* In the same year he renounced his citizenship of Geneva; and in 1764 he wrote the *Lettres écrites de la montagne* in reply to J. B. Tronchin, procurator-general of the Genevan republic, who had written in defense of the executive council of Geneva (the Petit Conseil) for having ordered the burning of *Émile* and of *Du contrat social.* In Sept. 1764 Rousseau was asked by Matteo Buttafuoco, a friend of Pasquale Paoli, to prepare a constitution for Corsica. He never completed the task, though he did make a rough draft (published in 1861 under the title *Projet de constitution pour la Corse*). On the last day of 1764 he received an anonymous pamphlet, *Le Sentiment des citoyens,* attacking him savagely as a hypocrite, a heartless father and an ungrateful friend. It was written by Voltaire, and its effect on Rousseau was terrible. When he recovered from the shock, he decided to write his autobiography, the *Confessions.*

The *Lettres écrites de la montagne* had turned the Protestant pastors, both in Geneva and in Neuchâtel, even more strongly against him, and in Sept. 1765, after some stones had been thrown at his house, he decided to leave Môtiers, though he still enjoyed Frederick II's protection. He fled to the Île Saint Pierre, on Bernese territory, but was not allowed to stay there and eventually, on the advice of Keith and other friends and with the help of David Hume, went to England, where he arrived in Jan. 1766. Well received in London, he moved in March to Wootton in Derbyshire, to a house let to him at a nominal rent by Richard Davenport, a friend of Hume. Even before his departure for Wootton, he had heard that a mocking letter to himself, supposedly from the king of Prussia but actually written by Horace Walpole, was being circulated in Paris; and he had suspected that Hume might have had a hand in it. At Wootton his suspicions grew stronger, causing him to receive equivocally an offer of a pension from George III, which he badly needed but was loath to obtain through the good offices of Hume, whom he now believed to be a false friend, won over by the "philosophers" into a conspiracy to ruin his name. This fear and Hume's excessive zeal to justify himself publicly at Rousseau's expense led to an open quarrel between them, which excited and amused all cultivated Europe. In May 1767 Rousseau, by this time more than a little mad, fled in panic from England to France, where the order for his arrest, issued in 1762, was still unrevoked.

His Last Years in France (1767–78).—Rousseau went first to stay for a few days with the marquis de Mirabeau (Victor Riqueti) and then, taking the name of M. Renou, moved to the Château de Trye, near Gisors, lent to him by the prince de Conti (Louis François de Bourbon). While he was at Trye his *Dictionnaire de musique,* which he had been working on for years, was at last published. He left Trye abruptly in June 1768, again in a panic, going first to Bourgoin near Lyon, where he married Thérèse le Vasseur, and then to Monquin, whence he moved to Paris early in the summer of 1770, to defend himself against the "conspirators." There he resumed his own name, but was left unmolested. To justify himself to the world, he read extracts from his *Confessions* in various Parisian drawing rooms until, at the request of Mme d'Épinay, he was asked by the police to desist. In 1771 Count Wielhorski begged him to advise the Poles how they should reform their institutions, and he wrote the *Considérations sur le gouvernement de la Pologne,* first published in 1782. Still eager to justify himself, he wrote the *Dialogues: Rousseau juge de Jean-Jacques.* He tried in Dec. 1775 to place his work under God's protection on the high altar of Notre Dame, but was prevented from doing so by the iron grille surrounding the choir, which he had never noticed on his many previous visits to the great church. It seemed to him that God had joined his persecutors, and for a time he was in despair. During the last two years of his life, his madness weighed less heavily on him, and he wrote the most serene and the most delicate of his works, the *Rêveries du promeneur solitaire,* which contains descriptions of nature and of man's feelings for nature of a wonderful freshness and beauty. In May 1778 he moved to Ermenonville, to a pavilion on the estate of the marquis René de Girardin, where he died, about six weeks later, on July 2. He was buried on the Île des Peupliers in the lake at Ermenonville, but his remains were moved to Paris to the Panthéon during the Revolution.

The Importance of his Writings.—Rousseau was not a systematic, lucid or rigorous thinker. It has been said that he was not original, that he discovered nothing but merely gave passionate and eloquent expression to other men's ideas. This denial of his originality is probably based on a misunderstanding of the nature of political and social theory. Most of the ideas that the political and social theorist uses have a long ancestry; they do not, of course, always remain the same, for they change imperceptibly as a result of continual discussion and argument. Reputations for originality are more often made by giving names to ideas already coming into circulation than by inventing new ideas. In this way the fruits of many men's thinking are appropriated by the more lucid and articulate among them. The man with a gift for sorting out ideas is apt to be the first to see what new expressions are needed to prevent confusion between old and new ways of thinking, but his having this gift is not enough to make him original. New ideas do not usually get their distinctive names until some time after they have begun to circulate, and so their novelty is often not noticed even by the people who are influenced by them. Rousseau invented no new expressions, not even "the general will," for that phrase was used before him by Diderot. But that does not mean that he lacked originality. On the contrary, he had it in much larger measure than he appeared to have it, for he put a great deal of new wine into old bottles. To the utilitarian and to the positivist he has appeared extravagant and superficial, but the idealist has seen much more that is admirable in him.

Rousseau, when he said that man is naturally good, did not mean that the savage is better than the civilized man; he meant only to deny original sin and to suggest that, if civilized man is now feeble, anxious and unhappy, it is not because of any evil inherent in him but because his social environment is not suited to his nature. Man is born neither good nor bad, but with certain potentialities which he strives to realize; and if he is thwarted, he acquires ambitions and needs which cannot satisfy him, either because they are in themselves insatiable or because they bring him into conflict with other men. Rousseau saw a close connection between the structure of society and the moral and psychological condition of the individual. It seemed to him that society in his own day necessarily set men against one another and also frustrated and bewildered them, preventing them from acquiring the self-knowledge and self-mastery which alone bring happiness and social harmony. He believed that discord and moral confusion are the ineluctable consequences of excessive inequalities of wealth and of the size and complexity of modern society. Man cannot be happy and free, cannot be on good terms with himself and with his neighbours, except in a community simple enough to be intelligible to him and small enough to enable him to take a full and equal part in its government. In a vast community with a complex economy, there must be hierarchy and inequality, and the great majority of passive citizens are inevitably controlled and exploited by the active few. No community, he

thought, can be united and strong unless its members share certain fundamental beliefs and loyalties, and men cannot be truly free unless they are emotionally secure, which they will be only in a society of equals, where each man depends, not on the caprice or protection of some person or group stronger or wealthier than himself, but on a system of laws which are the same for all men and are made by the entire community. Though his ideal of the small and simple egalitarian state could not be realized, even in his own day, his criticism of contemporary society went deep. He taught men to think about society and the individual in new ways and to put new questions; and it is here, much more than in the specific solutions which he offered, that his originality and his insight are revealed.

If the reader is not to get a distorted and misleading conception of Rousseau's social and political theory, the *Discours* on inequality, which discusses the probable origins of actual society and government, and *Émile,* which lays down a plan of education to make an ordinary child morally and intellectually self-reliant and therefore well-balanced and free, must be studied as carefully as *Du contrat social,* which only describes an ideal. This outsider, this misfit, this vagabond, who felt that evil was thrust upon him by his position in a society where he could not feel spiritually at home, was the first and the most eloquent of the great radical thinkers, of the men who protested that modern society is rotten even at its roots. That he was sometimes, indeed often, one-sided and extravagant is obvious; what is less obvious, but not less true, is that he was also many-sided and equally passionate on every side. No one insisted more than he did that a people are made what they are by their customs and prejudices, that faith is stronger than reason, that freedom is the fruit of a moral self-discipline as slowly acquired as it is easily lost. He never preached revolution, believing that victims of oppression are so much debased by servitude as to be made unfit for freedom and have therefore to be brought gradually to it, as invalids to food too strong for their stomachs. In the *Projet de constitution pour la Corse* and in the *Considérations sur le gouvernement de la Pologne,* we find a cautious Rousseau, respectful of fact and of tradition. His influence was revolutionary, not because he approved of violence or of precipitate change (for that he never did), but because he felt the evils of society passionately and denounced them so eloquently that he brought the established order into hatred and contempt. He did not attack religious obscurantism or make fun of the church as Voltaire and the "philosophers" did; on the contrary, his attitude to Christianity was equivocal, for he was as much attracted by it as a moral and spiritual force as he was critical of some of its dogmas and practices. He was more dangerous than the "philosophers" precisely because he struck at the social order rather than at the old religions and because so many of the motives and emotions to which he appealed were of Christian inspiration. Among the great writers of his century, he had most in common, in his notion of society (though not in his feelings toward the established social order), with the baron de Montesquieu and with Edmund Burke (*qq.v.*); and in his notion of freedom and what constitutes the moral dignity of man, with Kant (*q.v.*).

Rousseau was much more than a moralist and a social and political theorist; he was also one of the greatest writers of his age, and the most eloquent. By his descriptions of the beauties of nature, by his idealization of romantic love and also of chastity and of fidelity as virtues that go naturally with that love, by his acute and delicate analysis of introspective moods, by his revealing and essentially sincere (though not always accurate) autobiography, he greatly enriched European literature. There was about his writings a warmth, an intimacy and a freshness not common in his day, and to these qualities, above all others, he owed his immense contemporary reputation, which was second to none, not even to Voltaire's.

ROUSSEAU, (PIERRE ÉTIENNE) THÉODORE (1812–1867), French landscape painter, a leading member of the Barbizon School (*q.v.*), was born in Paris on April 15, 1812. The son of a tailor, he began his artistic education in 1826 under a relative, Pau de St. Martin, and then studied landscape with Charles Rémond and figure painting with Guillon Lethière. Rémond and Lethière were painters in the neoclassical tradition, but the formation of Rousseau's style was based rather on extensive study of such painters as Claude Lorrain, Jan van Goyen, Jacob van Ruisdael, and Karel Dujardin.

After a visit to the Auvergne in 1830, he first exhibited at the Salon in 1831, then again in 1833 ("Shores of Granville") and 1834 ("Edge of the Wood, Compiègne," which earned him a third class medal).

In 1836 Rousseau's big work, "Descent of Cattle," resulting from a visit to the Jura mountains, was rejected by the Salon, as were all his entries during the next seven years. He was, however, vigorously defended by Étienne Thoré and was intimate with such painters as Ary Scheffer, N. V. Diaz de La Peña, and Jules Dupré.

Rousseau first visited the Fontainebleau area in 1833 and, in the following decade, finally settled at Barbizon, where eventually he became intimate with J. F. Millet. Unlike Millet, Rousseau continued to travel widely throughout France in search of subjects. In 1848, with the changes governing the composition of the Salon jury, Rousseau was elected a member, and in the same year received a state commission. Official recognition of his work increased so that he was well represented in the International exhibition of 1855 and became president of the fine art jury for the Exposition of 1867. He died at Barbizon on Dec. 22, 1867.

Rousseau's reaction against the neoclassical landscape puts him midway between the romantics and the realists. He made studies direct from nature ("The Valley of St. Vincent," National gallery, London), but his exhibition pictures were developed over long periods in the studio ("The Marsh in the Landes," Louvre, Paris, begun in 1844 but not exhibited until 1853). A traditional procedure of preparation in grisaille, with colour added in the later stages, was used for this painting. Comparison of "Edge of the Forest at Fontainebleau; Sunset" (Louvre) with the nearly identical composition of "A Glade in the Forest of Fontainebleau" (Wallace collection, London) suggests a willful reorganization of nature in the manner of the Dutch tradition and somewhat at variance with the intense analysis of appearances to be found in such works as "Oak at Fontainebleau."

(R. A. Dr.)

ROUSSEL, ALBERT (CHARLES PAUL MARIE) (1869–1937), French composer whose music is notable for its lyrical fervour, its austerely intellectual approach, and its harmonic audacities, was born at Tourcoing on April 5, 1869. His parents died when he was a child and he was brought up by his grandfather and later by his uncle and aunt. In 1884 he studied at the Collège Stanislas in Paris, and at the age of 18 joined the French Navy. As a sailor he made several journeys to the Far East, the exotic impressions of which he was able to recall in his later orchestral and dramatic works. At 25 he resigned his commission in the Navy and devoted himself to music, becoming a pupil of Vincent d'Indy at the Schola Cantorum in Paris. After studying there for six years, he joined the teaching staff in 1902.

Among his early compositions inspired by his knowledge of the Far East are the three *Évocations,* for solo voices, chorus, and orchestra, and the opera-ballet *Padmâvatî* (composed 1914–18; produced in Paris, 1923). An earlier ballet, *Le Festin de l'araignée* (1913), long remained in the repertory of the Opéra-Comique. Other notable stage works are the one-act opera *La Naissance de la lyre* (1925) and the ballet *Bacchus et Ariane* (1931). Of his purely orchestral works the best known are the symphonic poem *Pour une fête de printemps,* four symphonies (of which the third, in G minor, is particularly striking), the Suite in F, and the Sinfonietta for strings, all of which show his bold, personal style. In spite of his early training at the Schola Cantorum, where he came under the influence of César Franck, Roussel soon broke away from the Franckist as well as from the Impressionist tradition. His distinguished chamber music includes two violin and piano sonatas, a string quartet, a piano trio, and a trio for violin, viola, and cello. His songs show a completely unsentimental approach to the problem of setting words to music. They include settings of translations from the Chinese, among them *La Réponse d'une épouse sage;* and an English poem, *A Flower Given to My Daughter,* by James Joyce. Among his large-scale choral works the finest, apart from the *Évocations,* is his setting of the English text of Psalm 80, for chorus and orchestra (1928). Unlike his contemporaries, Debussy, Fauré, and Ravel, he wrote little for piano alone. The Suite, op. 14, and the Sonatina, op. 16, for piano are both fine works for the instrument, and so is the rarely performed Piano Concerto, which would doubtless be heard more often if the solo part had been conceived as a vehicle for virtuosity rather than as an integral part of the symphonic texture.

ROUSSILLON, GIRART DE, the hero of a 12th-century *chanson de geste* (*q.v.*) of the same name, which tells of his conflicts with his suzerain Charles, generally referred to as Charles Martel but also as Charles the Bald. The causes of the conflicts are not always clear. According to the earlier section of the story they are romantic, in that Charles forces his vassal Girart de Roussillon to exchange fiancées, taking Élissent, the more beautiful, for himself and giving her sister, Berte, to Girart; but elsewhere it is indicated that he is jealous of Girart's territorial possessions or believes him to be guilty of murder. The ideal of Christian peace which pervades the poem is emphasized by the miracle which stops the principal battle at Vaubeton, when the standards are burned by fire from heaven. Girart is finally vanquished, loses all his lands, and is forced to flee into exile. After 22 years in the forest of Ardenne, where he works as a charcoal-burner and his wife, Berte, as a seamstress, they return to France. Girart is reconciled to the king, receives his lands again, and founds a number of abbeys, including Vézelay.

The hero has been identified with a certain historical figure, Gerardus, regent of the kingdom of Provence in the reign of Charles the Bald, with whom he came into conflict. This Gerardus founded the abbeys of Vézelay and Pothières. He also appears as Girart de Vienne, in the epic of that name, and as Girart de Fraite in *Aspremont* and other poems (*see* R. Louis' works cited in the bibliography). There exist also a life in Latin of Girart de Roussillon, probably dating from the 13th century, a 14th-century poem in alexandrines, and two prose versions, one in 1447 by Jean Wauquelin (d. 1453), a translator employed by the dukes of Burgundy, and the other forming part of the anonymous 15th-century *Histoire de Charles Martel.* Girart de Roussillon figures also in the *Chanson de Roland* (*see* ROLAND, CHANSON DE), as one of the 12 peers slain at Roncevaux, in contradiction with both historical fact and the poems. An earlier version of the legend may well have been connected with the province of Roussillon, but in the extant poems Girart's castle of Roussillon is in Burgundy. Louis identifies it with Vix, near Chatillon-sur-Seine.

Girart de Roussillon is unique among *chansons de geste* for its language, its style, and the blending of feudal, romantic, and realistic features. The main theme is the iniquity of private war, especially when waged without just cause. The language is a curious and probably artificial mixture of Provençal and French; there are indications that the extant version may have been composed in Poitou. The poem is an early example of the use of rhyme in a *chanson de geste,* and the ten-syllable line has the caesura after the sixth syllable, which is rare.

BIBLIOGRAPHY.—*Editions:* Critical Edition of the *chanson de geste* by W. M. Hackett, Société des Anciens Textes Français (1953–55); French translation from the original Provençal by P. Meyer (1884); abridged version by H. Berthaut (1929). The 14th-century poem has been edited by E. B. Ham, Yale Romanic Studies (1939).

Studies: R. Louis, *De l'histoire à la légende. Girart, comte de Vienne, et ses fondations monastiques* (1946) and *Girart, comte de Vienne, dans les chansons de geste* (1947). (W. M. Ha.)

ROUSSILLON, a province of France for the last 130 years of the *ancien régime,* corresponding to the major part of the modern Pyrénées-Orientales (*q.v.*). It comprised the former countship of Roussillon proper (Spanish Rosellón), that is, the coastal zone, with Perpignan (*q.v.*); the northern half of that of Besalú, from the upper Tech Valley northward to the Corbières; and the northern half of that of Cerdagne (Spanish Cerdaña), including Conflent on the upper Têt River.

Ruscino (near Perpignan) was settled by a people with markedly Iberian affinities from the 7th century B.C. to the latter part of the 3rd, when it came under the control of the Gallic Volci. Conquered by the Romans in the 2nd century B.C., the country passed to the Visigoths (*see* GOTHS) in A.D. 462 and remained theirs till the Arabs overran it *c.* 720. Pepin the Short expelled the Arabs in the 750s and annexed the country to Carolingian France. At the final separation, in 865, between Septimania (part of the future Languedoc) and the Spanish March (Frankish Catalonia), Roussillon was included in the latter. Later in the 9th century feudalism gave rise to hereditary countships in the area, the holders of which all seem to have been related to the contemporary counts of Barcelona (*q.v.*). The latter dynasty acquired Besalú in 1111, Cerdagne in 1117, and Roussillon proper in 1172, by which time it had also inherited Aragon. France renounced its theoretical suzerainty over the Pyrenean countships by the Treaty of Corbeil (1258), which fixed the Franco-Aragonese frontier on the Pas-de-Salces, passageway between the Corbières and the sea. Meanwhile, from the 10th century onward, there had been a great florescence of monasticism in the area, well exemplified by outstanding Romanesque architecture. The House of Barcelona-Aragon granted privileges to the towns, and commerce benefited from the integration of Roussillon with Catalonia (*q.v.*).

Roussillon formed the mainland core of the Kingdom of Majorca, which James I of Aragon and Majorca left in 1276 to his younger son James II (sometimes reckoned as James I; d. 1311). James II's grandson James III (II; d. 1349), who succeeded his uncle Sancho in 1324, was dispossessed by Peter IV of Aragon in 1344.

In 1461 the Catalans revolted against John II of Aragon. Louis XI of France, under the pretext of helping John (Treaty of Bayonne, 1462), sent two expeditions to overrun Roussillon and Cerdagne, which were then held for France till 1472. John then recovered Perpignan; but in 1475, while John was preoccupied with Castilian affairs, Louis XI annexed the country again. Charles VIII of France, seeking goodwill for his Neapolitan schemes, retroceded Roussillon and Cerdagne to Ferdinand II of Aragon (Treaty of Barcelona, 1493). Spanish fortification of the country in the 16th century was offset by French immigration.

During the Thirty Years' War (*q.v.*), the Catalan revolt of 1640 led to the rapid occupation of the lands north of the Pyrenees by the French, to whom Perpignan fell in 1642. Spain finally renounced the province by the Treaty of the Pyrenees (1659).

ROUVIER, MAURICE (1842–1911), French statesman whose career well illustrates the political history of his time, was born at Aix-en-Provence on April 17, 1842. Having supported Léon Gambetta (*q.v.*) in his candidature at Marseilles in 1869 and founded a republican journal, *L'Égalité,* in 1870, he was elected to the National Assembly as deputy for Marseilles in July 1871. A financial expert, he repeatedly served on the budget commission and was minister for commerce and the colonies under Gambetta

(1881–82) and for commerce under Jules Ferry (1884–85).

At the end of May 1887, Rouvier took office as premier and minister of finance, with the support of the moderate republican group, but without that of the Radicals. His government withstood the agitation for Gen. Georges Boulanger (*q.v.*); but when Daniel Wilson, son-in-law of the president of the Republic, Jules Grévy (*q.v.*), was exposed for trafficking in honours, Rouvier resigned (Nov. 19, 1887) to force the resignation of Grévy.

Minister of finance again in four successive ministries (1889–92), Rouvier became implicated in the Panama Scandal (*q.v.*) and resigned his portfolio on Dec. 12, 1892. Claiming that the money that he had received from the Panama Company had been for the defense of the Republic, he discredited himself by arguing that he had been engaged in the country's most important affairs without his fortune having increased "abnormally." The commission of inquiry found no case against him.

Elected senator for Alpes-Maritimes in spring 1902, Rouvier became minister of finance under the Radical Émile Combes in June. He then prepared a project for introducing income tax. Premier and minister of finance again from Jan. 24, 1905, he took the ministry of foreign affairs also in June, after his personal approach to the Franco-German crisis over Morocco had provoked the resignation of Théophile Delcassé (*q.v.*). He fell from power on March 7, 1906, over questions arising from the government's decisive act of 1905 for the separation of church and state. Rouvier died at Neuilly on June 7, 1911.

ROUX, PIERRE PAUL ÉMILE (1853–1933), French bacteriologist noted for his work on diphtheria (*q.v.*), was born at Confolens, Charente, on Dec. 17, 1853. He studied medicine at the University of Paris and afterward held a faculty appointment there (1874–78). He then worked for ten years in Louis Pasteur's laboratory. Subsequently he held a post in the Pasteur Institute, and was its director from 1904 to 1918.

As Pasteur's pupil and collaborator, Roux studied hydrophobia, anthrax, and other infectious diseases. He and Alexandre Yersin were the first to demonstrate (1888) the toxic nature of filtrates from cultures of diphtheria bacilli. This discovery, together with the serological discoveries of Emil von Behring (*q.v.*), led directly to the development of diphtheria immunization and serum therapy—for which Roux campaigned ardently in the 1890s. He died in Paris on Nov. 3, 1933.

See *Lancet*, vol. 225, p. 1124 (1933).

ROUYN, a mining city on Lake Osisko in western Quebec, Can., is 394 mi. (634 km.) NW of Montreal. Mining (copper and gold) and smelting are the chief sources of employment. Rouyn is the urban and commercial centre for the whole mining area of western Quebec, which lies on a continuation of the mineral-bearing rocks of the Porcupine gold district and the Cobalt silver district of Ontario. The earliest homes in Rouyn date from 1922 when gold and copper ores in the area were first exploited. It was incorporated as a village in 1926, a town in 1927, and a city in 1948.

Population (1961) 18,716; with its twin city of Noranda (immediately adjoining but under separate administration) the 1961 population was 30,193. Of the total, 79% are French-Canadian; the remaining 21% are chiefly of European origin, comprising some 30 different nationalities. Rouyn is connected with Montreal, Quebec, and Toronto by rail and by a highway. (M. C. Ba.)

ROVERETO, a town in the province of Trento, region of Trentino-Alto Adige, northern Italy, lies in the Lagarina Valley on both sides of the Leno River, a left-bank tributary of the Adige, 15 mi. (23 km.) SSW of Trento on the Brenner-Verona railway. Pop. (1961) 25,911 (commune). The old quarter has narrow streets and parts of the 14th-century walls remain. The castle, once a Roman fortress and now a war museum, has a bell commemorating the fallen of World War I, during which Rovereto was heavily damaged. The newer section has broad avenues (*e.g.*, the Corso Rosmini, named after Antonio Rosmini-Serbati [*q.v.*], a native of Rovereto) and numerous 18th-century houses. Rovereto is a tourist and industrial centre and produces tobacco, silk, cotton, paper, gasoline engines, and wood and metal manufactures. First mentioned in 1154, it was ruled by the Castelbarco family from about 1300, then by Venice (1416–1509) and Austria (1509–1918). (F. Zu.)

ROVIGO, a town in the region of Veneto, northern Italy, capital of Rovigo Province and the seat of a bishopric, lies between the Adige and the Po, 27 mi. (43 km.) SSW of Padua and 45 mi. (72 km.) SW of Venice by rail. Pop. (1961) 46,502. Its oldest historical monument is the remains of a 10th-century castle. The 16th-century octagonal church of the Beata Vergine del Soccorso, called the Rotonda, by F. Zamberlano, a pupil of Palladio, has a campanile by B. Longhena and paintings of the Venetian School. The Accademia dei Concordi (founded by G. Campo [1557–1629]) contains paintings by Venetian masters, Holbein, and Dürer. The Palazzo Roncale (1555) is by M. Sanmicheli. Rovigo is on the Adigetto Canal and is a junction of the Bologna–Padua railway with eastward and westward branches. It is an important agricultural centre. As Rodigo (Neo-Latin, Rhodigium) it is mentioned in a document of 838. Ruled by the Estensi from the 12th century, it passed to Venice in 1482 and to Austria in 1797. It was annexed to Italy in 1866.

Rovigo Province, called the Polesine (Neo-Latin, Policinium—"land emerged from the waters"), is a fertile region stretching inland from the mouths of the Adige and Po and bordered north and south by their lower reaches. Area 696 sq.mi. (1,803 sq.km.). Pop. (1961) 270,983. Grains and sugar beet are the leading crops. (M. T. A. N.)

ROVNO, a town and *oblast* centre of the Ukrainian Soviet Socialist Republic, U.S.S.R., lies on the northeastern edge of the Volyno-Podolsk upland, 110 mi. (177 km.) NE of Lvov. Pop. (1959) 56,163. At the junction of railways to Brest, Baranovichi, Berdichev, and Lvov, it has food-processing, building-materials, and light-engineering industries. There is a pedagogic institute. Rovno town was taken by the U.S.S.R. from Poland in 1939 and by Germany in 1941, and returned to the U.S.S.R. in 1945.

Rovno Oblast covers an area of 7,838 sq.mi. (20,300 sq.km.). Pop. (1959) 926,225. Of this figure 17% (157,702) were urban, living in 9 towns and 17 urban districts. The *oblast* falls into two distinct regions. The larger, northern part, centred on Sarny, belongs to Polesye and forms an extensive lowland of swamp and forest. It is thinly inhabited and the only significant branch of the economy is timber working. The southern part lies on the Volyno-Podolsk upland, and is hilly and much dissected by river valleys and erosion gullies. There agriculture, especially grain and sugar-beet growing, is important. (R. A. F.)

ROWE, NICHOLAS (1674–1718), the most considerable 18th-century English tragic dramatist, the first person to produce a critical edition of Shakespeare's plays, and a poet laureate, was born at Little Barford, Bedfordshire, on June 20, 1674, the son of John Rowe (d. 1692), a successful lawyer, who left him £300 a year. He was educated at Highgate Free School and at Westminster School, where he was elected a king's scholar in 1688. Admitted to the Middle Temple in 1691, he was called to the bar in 1696. An ardent Whig, he held several minor government posts, and in 1715 succeeded Nahum Tate as poet laureate. He died in London on Dec. 6, 1718.

Rowe's first two plays, *The Ambitious Stepmother* (1700) and *Tamerlane* (? 1701), were both popular. The latter—in which the monstrous villain Bajazet represents Louis XIV and the priggish hero represents William III—was habitually revived until 1750 on the anniversaries of William's birth and landing. Both plays, like the later *Royal Convert* (1707), retain much of the blustering pomp of Drydenesque heroic drama, though the self-sacrifice of Cleone in the one and the loves of Moneses and Arpasia in the other foreshadow that sentimental blank-verse drama which Rowe, following Thomas Otway (*q.v.*), developed in *The Fair Penitent* (1703), adapted from Massinger and Field's *Fatal Dowry*. This, the first of Rowe's "she tragedies," was the forerunner of many 18th-century bourgeois domestic dramas; and one of its characters, Lothario (apparently the prototype of Samuel Richardson's Lovelace, as Calista, its heroine, was of his Clarissa), gave a new word to the language. *Jane Shore* (1714), "written in imitation of Shakespeare's style," and *Lady Jane Gray* (1715) are in the same lachrymose strain. His only comedy, *The Biter* (1704),

described by Congreve as "a foolish farce," though the author himself, Dr. Johnson relates (*Lives of the Poets*, vol. ii), laughed "with great vehemence" at every joke.

Rowe's poetic output included occasional odes and some translations, the most important being that of Lucan's *Pharsalia* into heroic couplets (published posthumously, 1718), which was greatly admired throughout the century.

The Work of Mr. William Shakespear, Revis'd and Corrected (six volumes, 1709; nine volumes, including poems, 1714) was the first "edited" edition of Shakespeare. Rowe claimed to have compared "the several Editions," but his text mainly follows the Fourth Folio (1685) and is poor by modern standards. He was, however, the first to attempt to establish the text by reference to the original editions, and in *Hamlet, Romeo and Juliet, Henry V,* and *King Lear* he restored some passages from early texts. By abandoning the clumsy folio format (a 9 × 12 in. page size), he brought the plays within reach of the average reader; and he also gave lists of *dramatis personae,* attempted act and scene divisions, and supplied a *Life,* mainly from material collected in Warwickshire by Thomas Betterton (*q.v.*). Though mostly dubious tradition, this remained the basis of accounts of Shakespeare until the end of the century. *See* also SHAKESPEARE, WILLIAM.

BIBLIOGRAPHY.—Rowe's *Works* were last printed in 2 vol. in 1792. For a critical account and bibliography, see *Three Plays by Nicholas Rowe,* ed. by J. R. Sutherland (1929). (Jo. C.)

ROWELL, NEWTON WESLEY (1867–1941), Canadian jurist and politician, chief justice of Ontario, 1936–38, and chairman of the Royal Commission on Dominion-Provincial Relations, 1937–38, was born Nov. 1, 1867, in Middlesex County, Ont. Called to the bar in 1891, he practised law in Toronto (king's counsel, 1902). Active in the Methodist Church, from 1904 he had a prominent part in discussions leading to the formation of the United Church of Canada in 1925. In 1911 he accepted the invitation of the Liberal opposition in the Ontario Legislature to become party leader and was elected from North Oxford in that year.

Rowell entered federal politics as a member of R. L. Borden's Unionist government, formed in October 1917 and pledged to the enforcement of military conscription. He was president of the council and vice-chairman of the war committee of the cabinet, and was elected in the constituency of Durham in the 1917 election. Rowell represented Canada in the Imperial War Cabinet and Imperial War Conference, 1918; at the Washington conference of the International Labour Organization, 1919; and at the first Assembly of the League of Nations at Geneva, 1920. He also organized and administered Canada's first federal department of health, 1919–20. A strong nationalist, he consistently advocated the extension of Canadian autonomy within the British Commonwealth.

Favouring more liberal social policies than most of his colleagues, he retired from the cabinet in 1920 and from Parliament in 1921 to return to his legal practice; he thereafter argued a number of Canadian cases before the Judicial Committee of the Privy Council, London. He was president of the Toronto General Trust Corporation, 1925–35, active in the League of Nations Society in Canada, and president of the Canadian Bar Association, 1932–34. He was appointed chief justice of Ontario in 1936 and chairman of the Royal Commission on Dominion-Provincial Relations in 1937 but illness forced his resignation from both positions in 1938. His name continued to be associated with the commission, and with the significant report it issued in 1940, popularly known as the Rowell-Sirois Report. He wrote *The British Empire and World Peace* (1922), *Canada: a Nation* (1923), and a chapter on the evolution of Canadian autonomy for *The Cambridge History of the British Empire* (1930), vol. vi. He died at Toronto on Nov. 22, 1941. (M. E. P.)

ROWING, the propulsion of a boat by means of oars in a succession of strokes. An oar is a shaft of wood with a rounded handle at one end and a blade at the other. The blade, a thin broadened surface, is either flat or slightly curved to offer increased resistance to the water (spoon oar). The loom or middle portion rests in a notch or rowlock or between tholepins on the gunwale or outrigger of the boat.

Racing oars are provided with leather buttons to prevent the oar from slipping outward. An oar may be regarded as a lever of the first order, the weight to be moved being the water and the fulcrum being the lock or tholepin; or as a lever of the second order, the weight to be moved being the boat, and the fulcrum the water pressing against the blade. Theoretically an oar functions at one and the same time in both capacities, but practically the lock or pin is the fulcrum, and the point at which the oar is buttoned determines the leverage and is a fundamental factor in the mechanics of rowing.

Rowing a boat and paddling a canoe (*q.v.*) have in common the propulsion of a floating craft through the water by muscular power applied to a lever, oar or paddle, in a succession of strokes. But in rowing, the oarsman, seated on a thwart, faces toward the stern and pulls the oar handle toward his body with the tholepin or oarlock as a fixed fulcrum, while in paddling a canoe the canoeist, generally in a kneeling position, faces toward the bow and throws forward the weight of his body, using one arm as a moving fulcrum.

In nautical use sculling is the propulsion of a boat by a single long oar worked to and fro from a notch in the stern transom, the blade being turned under water so as to give both projection and direction and acting like the tail of a fish. "Sweeps" and "sculls" are traditional terms for long and short oars.

As rowing developed into a form of competitive sport new terms were introduced and traditional terms acquired special meanings. Technically a stroke includes all the motions of an oarsman from the time he dips his oar for the catch to the time when it is again in the same position. The recovery is the part of the stroke during which the blade is in the air. Feathering is turning the blade by a wrist motion as it is lifted from the water and carrying it toward the bow in a nearly horizontal position until it is squared or bevelled (*i.e.*, the upper edge inclined slightly to the stern) for the next stroke. If the oarsman fails to clear the water with his blade on the recovery, because he has feathered too soon or too much or too little or because the boat has lurched down on his side, he "catches a crab."

Sculling as distinguished from its nautical sense is propelling a light racing craft with an oar in each hand. Oars so used are called sculls. "Singles" and "doubles" are popular entries in all regattas, and champion scullers have won wide acclaim. Rowing in the specialized sense is the art of propelling a racing craft by two or more oarsmen, each of whom handles a single oar, called a sweep. Paddling in boat racing parlance is rowing at reduced speed and at a leisurely pace. Sweep oarsmen row in pairs, fours, sixes (obsolete) and eights. Eights are numbered from the bow, and number eight is known as stroke.

The coxswain (cock, a small boat; swain as in boatswain) not only steers but gives the necessary commands and in a race calls for spurts and in a stern chase informs the captain or the stroke of the position of the competing boats.

History.—Rowing is now confined almost entirely to small boats and racing shells, but in ancient times it was the chief means of propelling vessels of war. As the size of vessels increased, sails gradually displaced oars, in both warships and merchant ships, but large galleys (*q.v.*) continued to be rowed in the Mediterranean until the 18th century. The oarsmen, generally captives of war or criminals, were chained to the benches, whence the term "galley slaves." Ancient galleys were rated according to the number of rowing banks or tiers of oars. The first recorded Roman fleet consisted of triremes (three-bank galleys). The earliest recorded amateur oarsmen were the islanders who entertained Ulysses on his return to Ithaca. Boat races probably formed part of Panathenaic and Isthmian festivals (*see* BOAT).

Virgil, in his account of the funeral games instituted by Aeneas for his father Anchises, gives a vivid description of a boat race:

> The waiting crews are crowned with poplar wreaths;
> Their naked shoulders glisten, moist with oil.
> Ranged in a row, their arms stretched to the oars,
> All tense the starting signal they await.
> Together at the trumpet's thrilling blast
> Their bent arms churn the water into foam;

The sea gapes open by the oars up-torn;
With shouts and cheers of eager partisans
The woodlands ring, the sheltered beach rolls up
The sound, the hills re-echo with the din.

The earliest invasions of England were effected with the help of oars. The Britons, paddling wicker coracles, were no match for the legions that Caesar landed on their beachheads from his Roman triremes. Later the Anglo-Saxons, rowing and sailing across the North sea, and after them the Danes, entered the estuaries of the east coast. Sails are mentioned oftener than oars in Old English literature, and rowing had not yet become a sport that could be described in Shakespeare's words:

There be some sports are painful, and their labour
Delight in them sets off.

William of Malmesbury (*c.* 1090–*c.* 1143) records that Edgar the Peaceful was rowed in state on the river Dee by tributary kings, himself acting as coxswain.

Boat Racing in England.—The Thames may fairly be called the cradle of rowing as a pastime and competitive sport in modern times. The nobility and gentry who had mansions on the banks of the river relied almost entirely on their elaborately fitted barges as a means of conveyance. As early as 1454 Sir John Norman, mayor of London, "built a noble barge, and was rowed by watermen with silver oars." The lord mayor's procession by water to Westminster was an annual event until 1856. From the 15th century on, a considerable body of men lived by "the trade of rowing" as the statutes define the occupation of the watermen. In Queen Anne's time the river was still the highway of London, and there were about 10,000 licensed watermen on the tidal reaches of the Thames above London bridge. There were undoubtedly competitions between these in the 16th and 17th centuries, but the first race of which there is record is that for the "Doggett's Coat and Badge." Thomas Doggett, an Irish comedian, in 1716 offered an "Orange coloured Livery with a Badge representing Liberty, to be rowed for by six watermen from London Bridge to Chelsea, annually on the same day, August 1, forever." Except during World Wars I and II, the race was rowed regularly under the administration of the Fishmongers' company.

The first English regatta (Italian *regata,* originally a gondola race in Venice) took place on the Thames in 1775. Though there are numerous instances of professional matches at the beginning of the 19th century, the increased participation in boat racing by amateur oarsmen, after the Napoleonic wars, overshadowed professional rowing, which never had the vogue in England which it attained in the United States (*see* below). Eton had a ten-oared boat, the "Monarch," and three eight-oars as early as 1811, but there is no record of any formal racing between amateur crews until 1817, the date of the founding of the Leander club, which rapidly gained the prestige it maintained from that time, as the oldest and most distinguished rowing club, whose eights, composed mainly of Oxford and Cambridge varsity oarsmen, upheld the highest standards of English rowing and sportsmanship.

The first race between Oxford and Cambridge was rowed in 1829 over a 2-mi. course at Henley-on-Thames, but it was not renewed until 1836. In 1845 the race was rowed over a 4¼-mi. course from Putney to Mortlake, and in 1856 became an annual event except during World Wars I and II, attracting huge crowds along the banks of the river.

The Henley Royal Regatta.—The reaches of the Thames at Henley are not only the most beautiful along the river but, because of a straight stretch of more than a mile immediately below the town, offer an ideal course for racing shells.

The Henley Royal regatta, established in 1839, has brought together not only the pick of English crews but, in the open events, has attracted competitors from Europe, America and Australia. Like other comparable events, it was interrupted by World Wars I and II. The course is 1 mi. 550 yd. with its finish near the town bridge in sheltered water, with sunny meadows and the shaded lawns of country houses on each side of the river. The races are rowed in the first week of July and furnish three days of continuous excitement to the spectators that throng the towpath and the enclosures at the finish. Because of the narrowness of the river and the many entries, the races are now rowed in heats of two or more entries. The course is protected by booms on each side, behind which spectators in punts and on houseboats moored along the banks obtain an unobstructed and close view of the competing oarsmen. There have for many years been eight events, four of which are open to all amateurs; viz., the Grand Challenge cup for eight oars (the oldest, established in 1839), the Stewards' cup for fours, the Silver Goblets for pair-oars and the Diamond Sculls for single scullers. In 1939 a ninth event, the Double Sculls, was added. The Grand Challenge cup and the Diamond Sculls have long been the most coveted trophies in the rowing world.

Australia and Canada.—Rowing as a sport began in Tasmania about 1830, and by 1880 eight-oared races between crews representing the various states had become annual fixtures, held alternately in the six capital cities. Interuniversity rowing originated in 1870. In 1893 Old Blues from Oxford and Cambridge presented the magnificent Oxford and Cambridge cup, which thereafter was contested for by the six state universities and like the interstate contest is rowed in each capital city by rotation.

In Canada, the 1870s were the heyday of the professional scullers. Purses ran from $50 upward to $1,000 and in international matches from £500 to £2,000. The outstanding world champion was Edward Hanlan of Toronto, who defeated the best scullers of Canada, the U.S., England and Australia. As the distinction between professional and amateur rowing became more sharply drawn, following the lead of England, Canada developed numerous amateur rowing clubs, among them the famous Argonauts of Toronto. The Canadian national championships are contested at the Royal Canadian Henley regatta held annually on the old Welland canal at St. Catherines, Ont.

United States.—In the United States, as in England, rowing as

CENTRAL PRESS FROM PICTORIAL PARADE

FINISH OF THE 4¼-MI. OXFORD-CAMBRIDGE BOAT RACE AT MORTLAKE, 1960. THE OXFORD CREW (AT LEFT) WON BY 1¼ LENGTHS

a competitive sport originated in contests between "occupational" oarsmen. In 1811 and 1823 the ferrymen of Whitehall in New York city defeated their Long Island and Staten Island rivals on the Hudson. In 1824 they outrowed a crew of Thames watermen from the visiting British frigate "Hussar," in a four-mile race finishing at the Battery. This international race aroused tremendous local interest and the betting far exceeded the original stake of $1,000 offered by the captain of the "Hussar." Light keelless racing shells soon displaced the service boats of the early contests. The cleavage between amateur and professional, following the organization of the National Association of Amateur Oarsmen (N.A.A.O.) in 1872, inaugurated the golden age of professional sculling. Among the scullers who won national and international fame were James Hamill, J. A. Ten Eyck, Wallace Ross, George Hosmer, Fred A. Plaisted, Walter Brown and Joshua Ward. The four Ward brothers had won an international race at Saratoga, N.Y., in 1871. Charles Courtney, who had begun as an amateur, turned professional and became the leading rival of the great Canadian Hanlan for championship honours and rewards. He was defeated by Hanlan in an exciting race at Lachine, Que., in 1878. A return match for a purse of $6,000 at Lake Chautauqua was never rowed because Courtney's shell was found hacked in two on the morning of the race. This fiasco and the suspicion that betting and shady "deals" influenced the results of races were responsible for the decline of professional sculling in the United States. Courtney's later reputation was based on his striking success as coach of the Cornell crews, as was Ten Eyck's as coach of the Syracuse university crews for 35 years.

Amateur Clubs.—The first organization of amateur clubs was the Castle Garden Boat Club association of New York (1834); pleasure boating rather than racing was the main interest of these early clubs, their membership being based on social rather than aquatic prestige. The Detroit Boat club, 1839, the oldest survivor of these early clubs, became one of the most important members of the N.A.A.O. and has entered crews in many regattas. In 1858 the boat clubs along the Schuylkill river, Philadelphia, Pa., were organized as the Schuylkill Navy. The boathouses of the Navy stretch for nearly a quarter-mile, known as boathouse row, along the banks of the river in Fairmount park, and until the silting up of the river, the Schuylkill course was one of the most popular and picturesque in the U.S., during the years when Philadelphia was a centre of the two great English sports of cricket and rowing. One of the most famous of these Philadelphia clubs is the Vesper Boat club, whose eight-oared crew furnished a sensation in defeating the world-champion Ratzeburg club crew of Germany to win the gold medal in the Tokyo Olympic games in 1964. The first regatta to which only amateur oarsmen were admitted followed the organization of the N.A.A.O. in 1872 and was rowed on the Schuylkill under the auspices of the Schuylkill Navy. The N.A.A.O. thereafter was the chief promoter of rowing among the amateur clubs, holding annual regattas for the championship of the United States in single, double and quadruple sculls, and pairs, fours and eights.

Intercollegiate Rowing.—The first formal intercollegiate boat race was rowed between Harvard and Yale in 1852 on Lake Winnepesaukee. With a few exceptions the race was rowed at four miles after 1876, at New London. The Yale-Harvard boat race is the oldest intercollegiate contest in the United States and antedates football by 17 years.

In the 1870s rowing became popular at a number of eastern colleges. In 1875 there was a regatta on Saratoga lake in which 13 colleges participated. When Yale and Harvard in 1878 went to New London for their dual race, Lake George became the scene of college races in fours in which Cornell or Pennsylvania generally won, Wesleyan, Bowdoin, Columbia and Princeton affording good competition. In 1887 eights took the place of fours, and, until the establishment of the Poughkeepsie regatta in 1895, these races were rowed at New London, Cayuga lake, Lake Minnetonka and one on the Delaware at Torresdale (1894). From the inauguration of the four-mile race at New London, Harvard and Yale regarded this as the culmination of their rowing season. Though the record of the Cornell crews in the 1890s, the defeats of Yale and Harvard

by Cornell and Princeton crews in the decade 1911–21, and the appearance of California and Washington and the U.S. Naval academy at Poughkeepsie challenged the leadership in college rowing that formerly could fairly be claimed by Harvard and Yale, the picturesqueness of the New London course, the tradition of the race and the prestige of Yale and Harvard among U.S. universities continued to surround the Harvard-Yale boat race with an interest analogous to that surrounding the Oxford-Cambridge race in England, the one rowed on the English Thames at London and the other on the United States Thames at New London. In 1895 Cornell, Columbia, Syracuse and Pennsylvania joined in a rowing association with annual regattas open to invited crews at Poughkeepsie. The Poughkeepsie regatta continued not only to attract the foremost eastern college crews but also brought to the Hudson winning eights from the universities of California, Washington and Wisconsin and the United States Naval academy. Because of unsatisfactory water conditions, the Intercollegiate Rowing association (I.R.A.) regatta was moved to Marietta, O., for 1950 and 1951. Bad water conditions there caused its removal to Onondaga lake, Syracuse, N.Y., where a satisfactory regatta, the 50th anniversary of the I.R.A., was held in 1952 and each year thereafter.

In contrast to the dual race at New London, Poughkeepsie has had as many as 12 starters in the interuniversity race and Syracuse had had 15. From 1895 to 1915 Cornell led in number of victories. Thereafter the U.S. Naval academy, Washington, California and Cornell were the most frequent winners. Navy set a U.S. record in winning 31 successive races, including the Olympic championship in 1952 and three intercollegiate championships, from 1952 through 1955.

Rowing was established on the Pacific coast in 1899. The first race, in fours, was between Washington and California. In 1907 eights displaced fours, and the Washington-California race, alternating between Lake Washington and the estuary at Oakland, Calif., became the rowing feature in the far west, and these crews began winning laurels at Poughkeepsie and in Olympic competitions. The favourable climatic conditions of the far west, permitting rowing in the open the year round, the abundance of material in the great state universities and the program of rowing developed in the western universities all contributed to the enviable record of the western crews.

Princeton had abandoned rowing in 1884, but, as a result of Andrew Carnegie's gift of a lake formed by the damming of two streams and affording 3½ mi. of rowing water, resumed the sport in 1910. At this time the only races that college crews trained for were the long-distance contests at New London and Poughkeepsie. Princeton's revival of rowing was responsible for the inauguration of a series of short-distance races, 1⅞ to 2 mi., rowed on college waters and during term time, generally participated

in by three crews and called triangular races. In 1912 the Childs cup race, next to the Yale and Harvard race the oldest intercollegiate fixture, was revived. This trophy had been given in 1879 by George W. Childs, the publisher of the *Philadelphia Ledger,* to be competed for by Columbia, Princeton and Pennsylvania, but the race had lapsed after 1884. In 1911 Princeton inaugurated intercollegiate rowing on Lake Carnegie with a triangular race between Yale, Cornell and Princeton, in which Princeton defeated Yale and came in as a close second to a fast Cornell crew that later won at Poughkeepsie. The Carnegie cup offered for this race in 1921 came into annual competition. Later races between Yale, Columbia and Pennsylvania for the Blackwell cup, between the U.S. Naval academy, Pennsylvania and Harvard for the Adams cup, between Harvard, Princeton and Massachusetts Institute of Technology for the Compton cup and between Navy, Cornell and Syracuse for the Goes trophy became annual fixtures. All these races are alternately rowed on college waters, on Cayuga lake, Carnegie lake, the Charles river, the Housatonic river, the Harlem river, the Schuylkill river and the Severn river at Annapolis, and before the close of the spring term. Rutgers, Boston university, Wisconsin, Dartmouth, Brown, Marietta and Stanford are other colleges participating in the major regattas.

An annual regatta conducted by a group of smaller colleges under the name of the Dad Vail Rowing association, in honour of a former coach of Wisconsin, is participated in by Amherst college, Boston university, Brown university, Dartmouth college, Florida Southern college, La Salle college, Marietta college, Rollins college, Rutgers university, the University of Tampa, Georgetown university, Drexel Institute of Technology, Purdue university, St. Joseph's college of Philadelphia, Fordham university, George Washington university, Howard university and Trinity college.

The increased interest in rowing at the colleges led to the organization of lightweight crews averaging 150 lb. per man. Some of these crews made up in skill and speed for lack of weight, and in competing at the Royal Henley for the Thames Challenge cup defeated some of the best English college crews.

Rowing became a popular sport among both public and private schools, particularly at Kent school, Kent, Conn. U.S. schoolboy crews have won the Thames cup at Henley. There are various regattas especially for school crews and attracting numerous entries.

In 1902 the American Rowing association was formed to increase intercollegiate competition by means of short-distance races in the early season, concluding with an annual regatta at the Henley distance of 1 mi. 550 yd. Thus this regatta became popularly known as the American Henley. This association, with the introduction of short-distance races, did a great deal to stimulate college rowing. It likewise had events at its annual regatta open for club crews who thereby matched their skill against college crews.

U.S. College Crews in Europe.—In 1869 Harvard challenged Oxford and Cambridge to a four-oared race on the Thames from Putney to Mortlake; Oxford accepted and won.

In the only other interuniversity race between English and Americans, Cambridge in 1906 defeated Harvard by about two lengths. There have been many U.S. entries at Henley. In 1878 a four from Columbia university won the Visitors' cup. In 1881 a Cornell four was defeated for the Stewards' cup, and in 1895 a Cornell eight lost to Trinity hall, Cambridge. In 1896 Leander beat a Yale crew coached by Bob Cook. In 1901 a University of Pennsylvania eight lost by a few seconds to Leander in the finals for the Grand Challenge cup. In 1914 the survivors in the finals for the Grand Challenge cup were Harvard and the Union Boat club of Boston, composed of former Harvard oarsmen; Harvard won, bringing the cup to the United States for the first time. Princeton in 1934 was defeated by Leander in the finals of the Grand Challenge; both crews broke the Henley record established in 1891. In 1939 and 1950 Harvard again brought the Grand Challenge cup to the U.S. and in 1955 it was won by the University of Pennsylvania's champion sprint eight. In 1957 Cornell defeated Yale in an All-American final, breaking the course record. Harvard won the cup in 1959. Princeton in 1930 and 1934 and Yale and Harvard in 1938 entered 150-lb. crews for the Thames cup, which was won by Kent school in 1933, 1938, 1947 and 1950, by Tabor academy in 1936, 1937 and 1939 (both schoolboy crews), and by the University of Pennsylvania in 1951 and 1952, by M.I.T. in 1954 and 1955, by Princeton in 1956 and 1957, by Harvard in 1958, 1959 and 1960, and by Eliot House of Harvard in 1964.

Strokes, Styles and Coaches.—Sweep rowing was early differentiated from sculling in England. The so-called "English stroke" was developed by Oxford and Cambridge oarsmen. As exemplified by the best Leander crews and described by Edmond Warre, provost of Eton (*A Grammar of Rowing,* 1909), and R. C. Lehman of Cambridge (*The Complete Oarsman,* 1924), this stroke was based on early fixed-seat rowing, when body swing was the main source of power and the arms were used chiefly as connecting rods to transfer the weight of the body to the oar. When the sliding seat was introduced in the 1870s, the leg drive was added but the main stress was still on the body swing with shoulders carried well beyond the perpendicular at the finish. This required muscles which only years of practice could develop. The first challenge to this "orthodox" stroke came from a Cambridge student, Stephen Fairbairn, who had entered Jesus college from Australia in 1881 and as a member and coach of his college crews upset tradition by winning races in a style taboo to the "rigidly righteous" of the old school. Fairbairn (*Rowing Notes; Chats on Rowing,* 1934) emphasized leg drive and arm pull and considered smooth bladework more important than what he called the "showy style" of body work. If the proponents of the traditional stroke sometimes laid more emphasis on form than on speed, Fairbairn's stroke sacrificed form for speed.

The success of his and foreign crews was responsible for the adoption of several innovations, such as the lengthened slide, the use of the swivel oarlock in place of tholepins and the seating of crews amidships in straight alignment instead of in the staggered order formerly used to increase leverage.

The British have devoted much time to the technical and theoretic aspects of rowing. A good exposition of the British system is G. C. Bourne's *A Text-Book of Oarsmanship.* R. C. Lehman, a leading exponent of the British system, was in 1896 invited to coach the Harvard crews. To Yale in 1914 went Guy Nickalls as head coach, and to Pennsylvania his brother Vivian. Though all these men had brilliant records as oarsmen and coaches in England and stimulated interest in rowing at the universities they visited, the English system did not permanently strike root in the U.S. Many of the dons in the English universities assisted in coaching their college crews. Sir Leslie Stephen was an enthusiastic coach in his Oxford days. At Henley may frequently be seen on the towpath coaches who are equally at home among books and boats and who combine reading as a vocation with rowing as an avocation.

In the United States as in England the colleges first popularized rowing as a competitive amateur sport. The first college coaches were former professional scullers. Charles Courtney at Cornell, Ellis Ward at Pennsylvania, James Ten Eyck at Syracuse, Richard Glendon at Annapolis, William Haines at Harvard and M.I.T. were types of "professionals" who instilled into their charges principles of sportsmanship, besides rowing technique and strict conformity to training rules.

The stroke they taught was essentially a sculling stroke adapted to sweep rowing. The first attempt to introduce a stroke differentiated from sculling and based on the scientific principles of the English stroke was made by Robert Cook of Yale, who, as an undergraduate in 1873, when captain of his crew, went to England and studied the system prevailing at Oxford and Cambridge. The Yale crews of the next 20 years coached by him were noted both for speed and form. The "Bob Cook" stroke was characterized by a hard catch with squared shoulders, straight back, straight arms, quick hand shoot and slow slide on the recovery, length in the water and lower beat than the prevailing sculling strokes. After the Cornell experience at Henley in 1895, Courtney, always ready to experiment and improve both rigging and rowing, modified the short sculling stroke his crew had previously rowed, and in the Poughkeepsie regatta of 1896, in which both Yale and Harvard

participated, it was difficult to distinguish Cornell from Yale.

In later years Courtney modified the hard catch, shortened the swing at the finish and developed the slow slide and run between strokes that enabled Cornell to defeat crews rowing a much higher stroke. The advocates of the lower stroke say, "If men were machines, the crew rowing the highest stroke would always win, but men are not machines and a lower stroke and smooth form conserve power." Richard Glendon at the U.S. Naval academy taught a stroke with exaggerated swing of the body at the finish. The fine physique of the midshipmen, combined with their finished watermanship, brought victories to this stroke at Poughkeepsie and in the Olympics. The nearest approach to what may be called an "American stroke" was made by Hiram Conibear and his pupils at the University of Washington. Conibear, himself not an oarsman, when appointed rowing coach at Washington in 1907, studied Yale, Cornell and Syracuse methods, and on his return became an expert technician. He developed at the University of Washington, aided by the Pocock brothers, expert builders and riggers of racing shells, a system that by the 1940s dominated college rowing east and west. Edward Leader at Yale, Thomas Bolles and Harvey Love at Harvard, Fred Spuhn and Delos Schoch at Princeton, Russell Callow at Pennsylvania and Navy, Harrison Sanford at Cornell, Walter Raney at Columbia, Gosta Eriksen and Loren Schoel at Syracuse, Norman Sonju at Wisconsin, Alvin Ulbrickson and Fil Leanderson at Washington, Carroll Ebright at California, Robert Mock and James McMillin at Massachusetts Institute of Technology, Victor Michalson at Brown and Charles Logg at Rutgers were all products of the University of Washington and as coaches belonged to what fairly may be called the "Washington school" of rowing. As a matter of fact, there were only a few universities whose coaches were not former Washington oarsmen; viz., James Ten Eyck of Syracuse, Charles S. Walsh and Paul Quinn of the U.S. Naval academy, Hubert Glendon and Carl Ullrich of Columbia, Allen W. Walz of Wisconsin and Yale, James Rathschmidt of Yale, Harry Parker of Harvard, Joseph W. Burk of Pennsylvania, Pete Gardner of Dartmouth, George James Lemmon of California, William Leavitt of Rutgers and Jack Frailey of M.I.T.

While in England college coaches are "invited" by the captains of crews or boat clubs, in the United States intercollegiate athletics became increasingly subject to faculty control, and coaches of major sports such as football and rowing are appointed by college authorities and considered part of the salaried staff of the institution.

Robert F. Herrick at Harvard, Averell Harriman and Mather Abbott at Yale, J. Duncan Spaeth and Gordon Sikes at Princeton and Father Frederick H. Sill at Kent acted as volunteer amateur coaches at their institutions; similar examples among the rowing clubs could be noted. However, the system of salaried but otherwise nonprofessional coaches described above became prevalent in the United States.

Governing Bodies.—The first duty of the governing bodies for rowing in each nation is to establish an amateur rule specifying the qualifications necessary for anyone to engage in amateur rowing competition. The governing body's authority and rulings must be respected by the organizations and individuals participating in the sport, and it must have power to disqualify and suspend those who violate the amateur status or other rules prescribed for rowing competition.

It is also the responsibility of the national governing body in each nation to hold a championship regatta each year which shall be open to all classes that are eligible under the amateur rule. It is also the duty of the governing body, which in the U.S. is the Olympic Rowing committee, to conduct tryouts every four years to select those who are to compete in the international Olympic regatta.

The National Association of Amateur Oarsmen is the governing body in the U.S. for the clubs. For college rowing the Intercollegiate Rowing association, the Eastern Association of Rowing Colleges, the Western Crew association and the Dad Vail Rowing association are the governing bodies in all regattas. In Canada it is the Canadian Association of Amateur Oarsmen, and in Great Britain it is the British Amateur Rowing association.

For international competition, the International Rowing federation, whose exact name is the Fédération Internationale Sociétés d'Aviron (F.I.S.A.), is composed of the recognized national rowing organization in each nation. The International Rowing federation is the only organization that is recognized by the International Olympic committee; it is given charge of organizing and conducting the rowing competition in the Olympic games which are held every four years. In addition to this the international federation conducts a European championship regatta every year. At this regatta entries are accepted only from the nations whose governing bodies are members of the international federation. For the Olympic regatta, entries from any nation are acceptable providing that the amateur status of the oarsman entered is in accordance with the Olympic rules.

The National Association of Amateur Oarsmen was organized in 1872 in order to make a necessary distinction between amateur and professional competition. There was much professional rowing up to that time; amateurs and professionals were competing together and it was necessary that some means be found to meet this situation.

Outstanding Oarsmen.—Records indicate that the three most outstanding English oarsmen were Guy Nickalls, Sr., who won the Diamonds five times and stroked pairs, fours and eights to victory many times at Henley; F. S. Kelly, a great sculler who won the Diamonds three times; and J. Beresford, Jr., who won the Diamonds four times and competed in five Olympic regattas, being a victor in three and second in two.

Among the oarsmen of the United States, perhaps the most outstanding were James Ten Eyck, John B. Kelly, Paul Costello, Walter M. Hoover, William G. Miller, Joseph W. Burk, Joseph Angyal, John B. Kelly, Jr., Seymour Cromwell and Don Spero. The elder Kelly was the most versatile. In addition to winning three Olympic championships, he stroked pairs, fours and eights to victory many times. Burk made a most remarkable record in single sculling. In four years, 1937–40 inclusive, he won a total of 46 races in single sculls. These included the United States national championship four times, the Canadian championship four times, the Diamond Sculls twice and the Philadelphia Gold Challenge cup. He was voted the most outstanding athlete in the United States in 1939 when he was awarded the James E. Sullivan trophy.

In Canada, the dean of rowing and the most outstanding oarsman was Joseph Wright, Sr., of the Argonaut Rowing club, who won many races as stroke of pairs, fours and eights and competed at Henley five times. Other outstanding oarsmen were Lou Scholes, first Canadian to win the Diamonds, Robert Dibble, Joseph Wright, Jr., and later H. R. Pearce; the last represented Australia in his first Olympic competition in 1928 and thereby under the rules was required to represent Australia in 1932, although he had in the meantime transferred his residence to Canada.

Australia produced many good crews and scullers. An Australian crew won the Grand Challenge cup at Henley and the Diamond Sculls. In single sculling, the most outstanding were H. R. Pearce, who won the Olympic single sculls championship in 1928 and 1932; Mervyn Wood, who was world champion single sculler for nearly a decade until his defeat at the XVth Olympiad in 1952 by Y. Chukalov of the U.S.S.R.; V. Ivanov, of the U.S.S.R., Olympic champion in 1956, 1960 and 1964; and Stuart MacKenzie, who won the Diamond Sculls from 1957 through 1961.

ROWLAND, HENRY AUGUSTUS (1848–1901), U.S. physicist, a major contributor to the study of electricity, heat, and spectrum analysis, was born at Honesdale, Pa., on Nov. 27, 1848. He graduated in civil engineering at the Rensselaer Poly-

technic Institute, Troy, N.Y., in 1870, where he later became instructor in physics and then assistant professor. In 1875 he was elected to the chair of physics in the newly founded Johns Hopkins University, where he remained for the rest of his life. On a visit to Europe he studied under H. L. F. von Helmholtz in Berlin, where he showed experimentally that an electrostatic charge moving at high speed has the same magnetic action as an electric current. At Johns Hopkins he redetermined the mechanical equivalent of heat in a long series of experiments with improved thermometric and calorimetric methods; and in similarly refined studies he redetermined the value of the ohm. Turning to spectrum analysis, he constructed a dividing engine capable of ruling 14,000–20,000 lines to the inch on diffraction gratings. He then studied gratings ruled on spherical concave surfaces and applied their advantages to the development of exact spectrometry. He mapped the solar spectrum and made a systematic study of the arc spectra of numerous elements.

Rowland won many honours: he was the first president of the American Physical Society (1899–1900) and was elected a foreign member of the Royal Society of London in 1899. He died in Baltimore, Md., on April 16, 1901. His collected *Physical Papers* appeared in 1902.

(D. McK.)

ROWLANDSON, THOMAS (1756–1827), English caricaturist, was born in Old Jewry, London, in July 1756, the son of a tradesman or City merchant. On leaving school he became a student in the Royal Academy, but at the age of 16 he went to study in Paris and afterward made frequent tours on the continent. In 1775 he exhibited at the Royal Academy a drawing of "Delilah Visiting Samson in Prison." He took to drawing caricatures as a means of livelihood. His Academy drawing of Vauxhall (1784) had been engraved by Pollard, and the print was a success. Rowlandson was largely employed by Rudolph Ackermann, the art publisher, who in 1809–11 issued in his *Poetical Magazine* "The Schoolmaster's Tour"—a series of plates with verses by William Coombe which became very popular. Again engraved by Rowlandson himself in 1812, and issued under the title of the "Tour of Dr. Syntax in Search of the Picturesque," they had reached a fifth edition by 1813 and were followed by "Dr. Syntax in Search of Consolation" (1820) and by the "Third Tour of Dr. Syntax in Search of a Wife" (1821). The same collaboration of designer, author, and publisher resulted in the English "Dance of Death" (1814–16) and the "Dance of Life" (1822). Rowlandson also illustrated Smollett, Goldsmith, and Sterne. Other designs are in *The Spirit of the Public Journals* (1825), *The English Spy* (1825), and *The Humourist* (1831). He died in London on April 22, 1827.

Rowlandson's designs were usually executed in outline with a reed pen and delicately washed with colour. They were then etched by the artist on copper and afterward aquatinted—usually by a professional engraver, the impressions being finally coloured by hand. As a designer the quality of his work suffered from haste and overproduction.

See J. Grego, *Rowlandson the Caricaturist, a Selection from His Works,* etc., 2 vol. (1880).

ROWLEY, WILLIAM (? 1585–? 1624), English dramatist and actor, who collaborated with several Jacobean dramatists, notably with Thomas Middleton (*q.v.*). It is probable he was born in London, but the dates of his birth and death are much disputed. C. J. Sisson (in *The Lost Plays of Shakespeare's Age,* 1936) produces evidence that he died in 1624: it had previously been thought that Rowley outlived Middleton, but that he probably retired from the stage after Middleton's death in 1627. Rowley became an actor before 1610, when he was with the Duke of York's Men, a company which amalgamated with Lady Elizabeth's Men to form Prince Charles's Men. When the two groups separated again (1616–17), Rowley remained with the Prince's Men, but probably joined the King's Men in 1623. He had met Middleton *c.* 1614, but was already writing plays for his company in 1612–13, and in 1609 had published *A Search for Money* (reprinted for the Percy Society, 1840), a pamphlet in punning, Euphuistic prose, giving a lively picture of London life.

Of some 50 plays known to have been written by Rowley alone or in collaboration, comparatively few are extant. The most important of those by Rowley alone is *All's Lost by Lust* (performed 1619; published 1633), a romantic tragedy with a strong strain of dramatic morality, written in harsh but powerful verse. His other extant plays are comedies, and include *A New Wonder, A Woman Never Vext* (*c.* 1610; publ. 1631), *A Match at Mid-Night* (*c.* 1607; publ. 1633), and *A Shoo-maker a Gentleman* (*c.* 1608; publ. 1638). Plays written with Middleton include *The Old Law* (performed *c.* 1615), in which Massinger also collaborated; *A Fair Quarrel* (*c.* 1616) and *The Changeling* (1622), in both of which Rowley wrote the subplot, and helped with the plan of the whole; *Wit at Several Weapons* (*c.* 1616), incorrectly attributed also to Fletcher (*see* BEAUMONT AND FLETCHER); and *The World Tost at Tennis* (1620).

Other plays in which he collaborated are *Fortune by Land and Sea* (*c.* 1609), with Thomas Heywood; *The Witch of Edmonton* (1621), with Thomas Dekker and John Ford (*qq.v.*); *The Maid in the Mill* (1623), with Fletcher; and *The Birth of Merlin, or: The Child Hath Found His Father,* the 1662 title page of which wrongly attributes part authorship to Shakespeare. Study of his own plays and those in which he collaborated reveals development of style from brutal comedy to eloquent expression of pathos, and also an evolving concept of the character of the comic clown.

SAMUEL ROWLEY (fl. 1597–*c.* 1624), a dramatist apparently employed by Philip Henslowe (*q.v.*), has been described as William Rowley's brother, but they seem not to have been related. After 1601 he acted with, and wrote plays for, the Admiral's Men and other companies. Several plays in which he is thought to have collaborated are lost. His *When You See Me, You Know Me, Or the famous Chronicle Historie of King Henrie the Eight* . . . (probably performed 1604; publ. 1605; ed. by F. P. Wilson, 1952) resembles Shakespeare's *Henry VIII* (which may have been influenced by it) in owing something to popular tradition. His only other extant play, *The Noble Souldier. Or, A Contract Broken, Justly Reveng'd,* a tragedy (publ. 1634; reprinted in *Tudor Facsimile Texts,* vol. 142, 1913), was probably written largely by Dekker. He has also been credited with the prose scenes in some of Shakespeare's plays.

Stork, with introduction on Rowley's life and place in drama (1910); D. M. Robb, "The Canon of Rowley's Plays," in *Modern Language Review,* vol. 45 (1950); *see* also *The Changeling,* ed. by C. Leech for the "New Mermaid Series" (1964), with introduction on Rowley. For Samuel Rowley *see* H. D. Sykes, *Sidelights on Elizabethan Drama* (1925).

ROWLEY REGIS, a municipal borough (since 1933) in the Rowley Regis and Tipton parliamentary division of Staffordshire, Eng., in a hilly district 7 mi. (11 km.) W of Birmingham. Pop. (1961) 48,146. Area 6 sq.mi. The word Regis was added to Rowley (Roughlea) in 1140. Coal instead of charcoal is said to have been first used for smelting iron in 1619 by Ironmaster Dud Dudley. The oldest and biggest industries are nailmaking (17th century) and chainmaking. By 1820 "Rowley rag," a basaltic stone, was being quarried extensively for roads and Rowley was thoroughly industrialized. Heavy engineering, enameled hollow ware, brickworks at Blackheath, and clay mines at Netherton are other industries. Haden Hill Park was given to the council in 1921 and the Elizabethan house is used as a restaurant.

ROXANA (ROXANE), daughter of the Bactrian chief Oxyartes, was captured and married in 327 B.C. by Alexander the Great. After the latter's death (323) she had his second wife, Stateira (Barsine), killed, and herself gave birth at Babylon to a son (Alexander IV), who was accepted by the Macedonian generals as joint king with the idiot Philip III Arrhidaeus. In 319 Roxana joined Alexander's mother, Olympias, in Epirus, but she was captured in Macedonia by Cassander in 316, imprisoned at Amphipolis, and put to death with her son (310/309). She figures in later Greek tradition and in the Alexander romances

(*q.v.*) as the daughter of Darius, by confusion with Stateira.

ROXAS Y ACUÑA, MANUEL (1892–1948), first president of the Republic of the Philippines, was born at Capiz, Panay, P.I., on Jan. 1, 1892. He studied law at the University of the Philippines, entered politics, and in 1917 was appointed to the municipal council of Capiz (now Roxas City). He was governor of Capiz from 1919 to 1921, when he was elected to the House of Representatives in the Philippines, later becoming Speaker of the House. He was a member of the Philippine Constitutional Convention in 1934 and Secretary of Finance from 1938 to 1940.

During World War II he served as a colonel under Gen. Douglas MacArthur and later was captured by the Japanese. As a prisoner he helped to coordinate underground resistance to the invaders for three years. In 1945 he was president of the Senate when, as a Liberal candidate, he was elected president of the Philippine Commonwealth. When the country achieved its independence, July 4, 1946, Roxas became the first president of the new republic. He died at Clark Field, Pampanga, on April 15, 1948.

ROXBURGH, a border county of Scotland (area 664.9 sq.mi. [1,722 sq.km.]) which forms a rough rectangle about 18 by 35 mi. (29 by 56 km.), stretching from southwest to northeast between Northumberland (Eng.) and the Scottish counties of Berwick, Midlothian, Selkirk, and Dumfries.

Physical Features.—Much of the county comprises the basin of the Teviot (*q.v.*), the entire 40 mi. of its course as it flows northeastward to join the Tweed lying within Roxburgh. The Teviot is fed by numerous turbulent waters, such as the Borthwick, Ale, and Jed, all prone to flooding. The Tweed, joined on its left bank by the Leader, flows for 30 mi. near the northern edge of the county and opens into a western part of the low-lying Merse of Berwick. In the southwest, the Liddel opens the county toward the Solway Firth, and a low pass also links Liddesdale with the valley of the North Tyne. The highest land (Auchope Cairn, 2,382 ft. [726 m.]) lies in the southeast, where about 80 sq.mi. of lavas of Old Red Sandstone Age flank the great granitic intrusion of Cheviot (itself over the border); they form rolling moorland. Carboniferous rocks sweep round them from the south giving lower surfaces (Carter Fell, 1,815 ft.) planed over thick Fell sandstones, with thin shales and even coal seams (as in Liddesdale); the poor wet soils are peat-covered or heathery. A wedge of Carboniferous rocks also penetrates up the Tweed Valley, overlying basalts at the base of this series, which reach the surface in the "Kelso Traps," a V-shaped belt about 5 mi. wide which yields warm soils invaluable for early-ripening grain. The central third of the county comprises Upper Old Red Sandstone rocks molded into rolling countryside interrupted by volcanic hills like the Eildons south of Melrose and by many igneous dikes. Some rivers in this region have eroded down to the underlying Silurian rocks which form the surface rocks in the west of the county; they are the continuation of the closely folded graywackes, shales, and grits of the Southern Uplands, and share their characteristically rounded outlines, at a general level of about 1,000 ft.; dry grass moorland predominates. In the hills the rivers have cut notches into the U-shaped valleys eroded by the ice, and in the dales they have cut terraces in the gravels, boulder clay, and alluvium. There are several Forestry Commission plantations, all in the hills, the largest being Wauchope (13,495 ac.) which, with Newcastleton (7,754 ac.), is within the Border National Forest Park; the lowlands are well wooded.

Rainfall decreases from 70 in. (1,780 mm., mean annual) in the hills between Liddesdale and Teviotdale, to 27 in. (685 mm.) along the Tweed; the Cheviots have about 50 in. and the rest of the county 30 to 40 in. Spring is cold but dry, most rain comes from October to December, and snowfalls can be severe in the east.

(A. M. Le.; A. T. A. L.)

History and Antiquities.—Among the more important remains of the original inhabitants are the standing stones and circles at Plenderleith between the Kale and Oxnam; on Hownam Steeple, a few miles to the northwest; and at Midshiels on the Teviot. The stones on Ninestane Rig (943 ft.), near Hermitage Castle, and on Whisgill are supposed to commemorate the Scots of Dalriada who, under Aidan (Aedan), were defeated with great slaughter by Aethelfrith of Bernicia, king of Northumbria, at the Battle of Degsastan in 603. There are hill-forts in Liddesdale, Teviotdale, and Jedvale, but the largest example of its kind in Scotland is said to be on the most easterly of the three summits of the Eildon Hills in Tweeddale. One of the mysteries of the county is the Catrail, a linear earthwork consisting of a ditch and bank of quite modest dimensions which runs from Robert's Linn to the head of the Dean Burn—a tributary of the Borthwick Water. The Roman Dere Street crossed the border north of Brownhart Law in the Cheviots, then took a mainly northwesterly direction across the Kale, Oxnam, Jed, and Teviot to Newstead, near Melrose, where it is conjectured to have crossed the Tweed and run up Lauderdale into East Lothian. There are many sites of Roman forts, signal stations, and camps, the principal camps seeming to have been at Cappuck, southeast of Jedburgh, and near Newstead at the base of the Eildons, the site of Trimontium. After the retreat of the Romans the county was occupied by the Britons of Strathclyde in the west and the Bernicians in the east. It was then annexed to Northumbria for more than four centuries until it was ceded, along with Lothian, to Scotland in 1018. The Wheel Causeway or Causey which enters the county north of Deadwater is an ancient roadway. Between the heads of Wolfehopelee Burn and Battling Sike, and before splitting up and entering the improved lands, the road passes through a linear earthwork in two main tracks.

Roxburgh was constituted a shire by David I, its ancient town of Roxburgh (*see* Kelso) forming one of the Court of Four Burghs. The town was abandoned when the castle was destroyed and James II killed in 1460; the castle was partially rebuilt in 1547, but was destroyed finally in 1550. The burgh of Kelso, 14 mi. NE, superseded it. Other towns were repeatedly burned down, and the abbeys of Jedburgh, Kelso, and Melrose (*qq.v.*) were ultimately ruined in the expedition of the earl of Hertford in 1544–45. Of the ancient castles, that of Hermitage, though now only a shell, is the most striking. Dating from the 13th century, it was a stronghold of the Douglases from 1341 to 1492. Abbotsford (*q.v.*), near Melrose, was the last home of Sir Walter Scott (*q.v.*) and the country around Melrose is known as "the Scott country."

Population and Administration.—The population increased by about 53% in the first 60 years of the 19th century and then fell continuously until in 1961 it was 43,183. There were (1961) 72 persons who spoke Gaelic and English. The small burghs are Hawick (pop. 1961, 16,206), Kelso (3,968), Jedburgh (3,645), the only royal burgh and the county town, and Melrose (2,133). The four county districts have the same names. The county returns one member to Parliament with Selkirk and Peebles. The shires of Roxburgh, Berwick, and Selkirk form a sheriffdom, and a resident sheriff-substitute sits at Jedburgh and Hawick. The county offices are at Newtown St. Boswells (*q.v.*).

Agriculture and Industries.—Half of the total area of the county is improved land, the rest being rough grazing. Of the improved land, two-thirds is either temporary or improved grassland, sheep-rearing being the predominant farming type. South of Kelso, sheep farms average about 1,200 ac. and carry self-contained flocks of South Country Cheviot ewes. South of Hawick, Cheviot sheep still predominate but Blackface, the original breed, are also kept on some hirsels (sheep farms). West of Hawick, farming is nearly all hill sheep-farming in character, the only remaining area of hill sheep-farming (chiefly Cheviots) being north of Melrose. The arable stock farms combine sheep-breeding with cattle-breeding, which is on the increase, and cropping in oats, barley, and turnips. Typical arable stock farms carry half-bred ewes (Cheviot crossed with Border Leicester), which are crossed with Oxford Down or Suffolk Down rams to produce Down-cross lambs. The cattle are mainly pedigreed Shorthorns and the principal breed on the hill farms is the Galloway crossed with a white Shorthorn. Pig-breeding is increasing. Annually in September the largest outdoor ram sales in Scotland are held at Kelso and are attended by buyers from all parts of the country and from overseas. Great numbers of sheep are sold at the autumn sales at Hawick. Arable farming is important in

the rich low-lying areas round Kelso, where wheat, barley, and some sugar beets are grown in addition to oats and roots which are the common crops on upland stock farms. In some parts of Tweedside and Jedvale several kinds of fruit are successfully grown.

The "Common Ridings," celebrated each year with much pageantry at Hawick (*q.v.*) and other border towns, date from the time when the community grazed their stock on common land which had to be held against encroachment.

The two basic industries in the county are agriculture and textiles. Milling, agricultural implements, wire nail making, timber, and sawmilling are Kelso's trades; also the making of fertilizers and fishing tackle—the salmon fisheries on the Tweed are of considerable value. Hawick is famous for its hosiery and knitwear. Jedburgh manufactures tweed and woolen goods, and precision tools.

ROXBURGHE, EARLS AND DUKES OF. ROBERT KER (*c.* 1570–1650), 1st earl of Roxburghe, eldest son of William Ker (d. 1600) of Cessford in Roxburghshire, was a grandson of Sir Walter Ker (d. *c.* 1583), who had fought against Mary Stuart at Carberry Hill (1567) and Langside (1568), and a great grandson of Sir Andrew Ker (d. 1526), who had fought at Flodden (1513). James VI of Scotland appointed him privy councilor in 1599 and created him Lord Roxburghe in 1600. Robert accompanied James to London in 1603, where he became gentleman of the bedchamber (1607) and was created earl of Roxburghe (1616). Lord privy seal for Scotland (1637–49), he took no part in the Civil War except for supporting the Scottish Engagers, who invaded England in 1648 in support of Charles I. His surviving son Harry Ker (d. 1643), Lord Ker, left no male issue and on Robert's death in 1650 the estates and titles passed by special arrangement to SIR WILLIAM DRUMMOND (d. 1675), the youngest son of Robert's eldest daughter Jean and of John, 2nd earl of Perth. William took the name of Ker, became 2nd earl, and married his cousin Jean, first daughter of Harry Ker. His grandson, JOHN KER (*c.* 1680–1741), who succeeded his brother in 1696 as 5th earl, was created duke of Roxburghe in 1707 for his services in promoting the union between Scotland and England. This was the last creation in the Scottish peerage. A representative peer for Scotland in four parliaments, he was secretary of state for Scotland (1704–05 and 1716–25) and keeper of the privy seal for Scotland (1714–16). He fought against the Jacobite rebels at the battle of Sherrifmuir (1715).

His grandson, JOHN KER (1740–1804), the 3rd duke, who became lord of the bedchamber (1767) and groom of the stole (1796), was a famous bibliophile, whose library included a unique collection of books from Caxton's press and rare volumes of broadside ballads. To commemorate its sale in 1812, Thomas Frognall Dibdin proposed a dinner of bibliophiles, from which developed the Roxburghe Club. His cousin WILLIAM BELLENDEN (1728–1805), 7th Lord Bellenden, who succeeded as 4th duke, taking the name Bellenden-Ker, died childless in 1805. Seven years of litigation ensued, but in 1812 SIR JAMES INNES of Innes (1736–1823), 6th bart. (a descendant of Lady Margaret, 3rd daughter of Harry, Lord Ker), who had taken the name Innes-Ker in 1807, established his claim to the title and estates and became 5th duke. His son JAMES HENRY ROBERT INNES-KER (1816–1879), the 6th duke, was created Earl Innes in the peerage of the United Kingdom in 1837. His descendant, GEORGE VICTOR ROBERT JOHN INNES-KER (1913–), is the 9th duke. (T. I.)

ROXBURY, since 1868 a section of Boston (*q.v.*), Suffolk County, Mass., and previously a town of Norfolk County situated between Boston and Dorchester. Earliest spellings included Rocksbury, Roxburie, and Rocsbury.

The town was founded in 1630 by Puritan immigrants who came with Gov. John Winthrop. The early settlers were led by William Pynchon, who in 1636 led a party from there and founded Springfield, Mass. Anne Hutchinson (*q.v.*) was held in custody during the winter of 1637–38 at the home of the first minister, Thomas Welde. John Eliot, the apostle to the Indians, moved to Roxbury in 1632 and died there in 1690. Roxbury was the home of Thomas Dudley (*q.v.*), of his son Joseph, and of his grandson Paul; of Robert Calef (d. 1719), the leader of the opposition to the witchcraft craze; of Gen. Joseph Warren (*q.v.*); and of William Eustis (1753–1825), U.S. secretary of war (1809–12) and governor of Massachusetts (1823–25). Theodore Parker (*q.v.*) was the pastor of the Unitarian Church of West Roxbury from 1837 to 1846.

The Roxbury Latin School, a boys' preparatory school, was founded in 1645 by a group of town fathers, among them John Eliot; it was first known as the Free School of Roxburie.

West Roxbury was the scene of the Brook Farm (*q.v.*) experiment. (J. F. Co.)

ROY, RAM MOHUN (1772–1833), the founder of Brahmo Samaj (*q.v.*) in India, was not only a great religious leader and social reformer but also a far-seeing statesman who indicated the lines of progress for India under British rule. Hence he is sometimes called the father of modern India. He was born in 1772 in a village in Burdwan district in Bengal. During the first 30 years of his life he seems to have traveled widely outside his province and mastered several languages—Sanskrit, Persian, Arabic, Hebrew, Greek, and English, in addition to Bengali, his mother tongue. In 1803 he secured an appointment under the East India Company, served its administration in various capacities until he retired in 1815 and settled in Calcutta. There he began his great agitation against the rite of suttee (*q.v.*) and vigorously kept it up until suttee was abolished by law by Lord William Bentinck in 1829.

During 1815–19 Ram Mohun published his translations of the *Upanishads* and his papers on Hindu theism. His object in these and similar writings was to wean his countrymen from what he regarded as the corruptions of medieval Hinduism and the evils of Hindu society, viz., idol worship, animal sacrifices, polygamy and the caste system, and to draw their attention to the original purity of the teachings of Vedanta (*see* INDIAN PHILOSOPHY: *Vedanta*). It was for achieving this object that he also later founded the Brahmo Samaj (1828).

Ram Mohun next turned his attention to the problem of education, and in a famous letter to Lord Amherst (1823) made a vigorous plea for scientific and English education for India in preference to the traditional Sanskrit education. He was as great a champion of political freedom as he was of scientific education; his memorial for the repeal of the Press ordinance of 1823 has been hailed as the *Areopagitica* of Indian history. Ram Mohun's letters show that he greatly admired the progress of freedom in Europe and hoped that India through its British connection would grow in knowledge and freedom and ultimately claim equal partnership with Britain.

In 1830 Ram Mohun went to England on behalf of the titular emperor of Delhi to plead his cause before the British government. He fell ill there and died at Bristol on Sept. 27, 1833.

ROYAL AIR FORCE: *see* GREAT BRITAIN AND NORTHERN IRELAND, UNITED KINGDOM OF: *Defense: Air Force*; AIR POWER.

ROYAL AIR FORCE COLLEGE: *see* MILITARY, NAVAL AND AIR ACADEMIES.

ROYAL BALLET, THE, English ballet company and school, was formed on Oct. 31, 1956, under a charter of incorporation granted by Queen Elizabeth II to the Sadler's Wells Ballet, the Sadler's Wells Theatre Ballet, and the Sadler's Wells School. The Royal Ballet promotes the art, produces ballet, and trains dancers. The queen was patron at its inception and Princess Margaret was its first president. The Royal Ballet is administered by governors and a council.

The founders of the Sadler's Wells Ballet, Lilian Baylis and Ninette de Valois (*qq.v.*), began their work together in 1928 when Miss Baylis, who had taken over the Old Vic Theatre, London, invited Miss de Valois to produce dances for plays there. When Miss Baylis took over the Sadler's Wells Theatre, London, in 1931,

Miss de Valois followed to open a school of ballet. The first performance of ballet at Sadler's Wells was given on May 15, 1931; by September 1931 ballet had become a regular feature there. At the time of the outbreak of World War II the ballet company had grown in stature and repertoire and counted among its members some of the finest dancers in the world.

In 1946 Miss de Valois founded as a junior company the Sadler's Wells Theatre Ballet (the "Second Company") mainly for foreign and provincial tours. In the early 1950s it toured the U.S., South Africa, and the Continent. In 1955 it officially became the touring company with its own repertoire and in 1957 became the touring section of the Royal Ballet.

ROYAL CANADIAN MOUNTED POLICE, Canada's federal police force, was originally called the North West Mounted Rifles. The reaction of the U.S. to the thought of having an armed force patrolling the border caused the name to be changed to the North West Mounted Police. It was instituted in 1873 to establish law and order between the Manitoba border and the Rockies. Three hundred members assembled at Dufferin, Man., in the summer of 1874, and on July 8, with freight wagons, oxcarts, cattle for food, field guns, mortars, and an assortment of farm machinery, struck out across the plains to the Oldman River, in what is now southern Alberta, where they built Ft. Macleod and took up the task of policing 300,000 sq.mi. of wilderness. As the only authority in the region the force inherited a variety of work in caring for the stream of settlers that followed in its wake. It abolished the whisky traffic that had been ruining the Indian, tracked and brought to justice murderers, horse thieves, and desperadoes, and contained the warlike Sioux who had fled to Canada to escape U.S. wrath at the annihilation of General Custer's command in 1876. Just treatment of the Indian by the force resulted in the neutrality of the powerful Blackfoot Confederacy during the Northwest Rebellion of 1885 (*see* RIEL, LOUIS). As more than 300,000 settlers poured into Canada following the turn of the century the North West Mounted Police were of considerable assistance to the many who were without experience in surviving the wilderness. Under its vigilance the western extension of the Canadian Pacific Railway was completed. Anticipating the gold rush of 1898, the North West Mounted Police preceded the vanguard of prospectors to the Yukon. In 1904 the prefix "Royal" was added to its title in recognition of its services. In 1905 the provinces of Saskatchewan and Alberta were formed and retained the services of the Royal North West Mounted Police. In 1920 the force received its present title, undertook the enforcement of federal legislation throughout Canada, and transferred its headquarters from Regina to Ottawa.

The 1930s saw the inception of the present "marine" and "air" divisions of the force, the dog section, and the first of three crime detection laboratories. RCMP patrols emphasized Canada's claim to arctic sovereignty, ranging far and wide from detachments in the northland; between 1940 and 1942 the RCMP vessel "St. Roch" became the first ship to complete the west to east journey through the Northwest Passage.

The Royal Canadian Mounted Police employs several thousand uniformed personnel, special constables, civilians, and civil servants in its 17 divisions across Canada; its operations are directed by a commissioner from headquarters at Ottawa. As well as the federal statutes throughout Canada, it is responsible for the enforcement of the provincial statutes and the criminal code in all provinces except Ontario and Quebec. It polices more than 100 municipalities. It is charged with the internal security of the country and is the only police force in the Yukon and Northwest Territories where on behalf of other government departments it performs numerous administrative duties. The facilities of the national police services of the RCMP, comprising the crime detection laboratories and the identification branch of the force, are available to all authorized police forces. The RCMP-sponsored Canadian Police College is attended by selected members of the force and outside forces. The RCMP holds membership in the International Criminal Police Organization and maintains liaison offices at London, Eng., and Washington, D.C. Contingents from the force served overseas in World Wars I and II.

Applicants for the Royal Canadian Mounted Police are required to be British subjects or Canadian citizens and if accepted must engage for an initial term of five years. Recruits are trained at Regina, Sask., and Ottawa, Ont., and upon completion of training may be posted to any point in Canada excepting the extreme northern regions where service is voluntary.

The dress of the force has several variations, but symbolic of the RCMP is the broad-brimmed hat, scarlet tunic, blue breeches with wide yellow stripe, brown top boots, spurs, and Sam Browne equipment. Horses were long ago supplanted by motorized vehicles and the last equestrian class for recruits graduated in 1966.

ROYAL GEOGRAPHICAL SOCIETY. Founded in 1830 as the Geographical Society of London and incorporated by charter as the Royal Geographical Society in 1859, the "R.G.S." originated in the Raleigh Travellers' Club, formed in 1827. Soon after its foundation it absorbed the African Association, founded in 1788. The society promoted, or supported, in the 19th century, explorations in British Guiana (Sir Robert Schomburgk), Australia, Africa (David Livingstone, Sir Richard Burton, John H. Speke, James A. Grant, and Joseph Thomson), and the Arctic (Sir John Franklin and Sir George Nares); and in the 20th century, among others, Robert F. Scott's first Antarctic expedition; Sir Ernest Shackleton's Imperial Trans-Antarctic expedition; consecutive Mt. Everest expeditions culminating in Sir John Hunt's successful ascent of 1953; the Norwegian-British-Swedish Antarctic expedition (1949–52); and Sir Vivian Fuchs's Commonwealth Trans-Antarctic expedition (1955–58). In 1954, with the Alpine Club (partner in the Everest expeditions), the society established the Mount Everest Foundation to assist financially mountain exploration and research. The R.G.S. annually supports university, particularly student, expeditions. It is also active in forwarding geography in British universities, having promoted departments of geography at Oxford (1899) and at Cambridge (1903).

Its objects are to advance geographical knowledge through lectures and publications (including original maps and its quarterly publication, *The Geographical Journal*), through its library and public map room, and through instruction in exploratory surveying and the support of exploration and research. It has arbitrated in boundary disputes; *e.g.*, between Peru and Bolivia from 1911 to 1913. The society, which receives a small amount of state aid for its public map room, is governed by an annually elected council served by a permanent staff. The British sovereign annually awards two gold medals for exploration on the council's recommendation.

See H. R. Mill, *The Record of the Royal Geographical Society, 1830–1930* (1930); G. R. Crone, *The Royal Geographical Society: a Record 1931–55* (1955). (L. P. K.)

ROYAL OAK, a city of Oakland County, Mich., U.S., 11 mi. N of Detroit, has backed its slogan, "city of homes," by zoning three-fifths of its area for single dwellings. The population grew rapidly from 25,087 in 1940 to 80,612 in 1960. The site of early settlement, which dates from the 1820s, was originally surrounded by marshlands. The name is credited to Gov. Lewis Cass, who rested there in 1818 under a giant oak tree which he supposedly likened to the "royal oak" in Scotland whose foliage once concealed Prince Charles from the Roundheads. Royal Oak was chartered in 1921; the commission-manager government, in effect since 1917, includes a full-time planning director and municipal court.

Cultural life (literary, historical, dramatic, and musical activities for all age groups) centres on the public library. The Detroit Zoo lies partly within Royal Oak. The Shrine of the Little Flower has become well known mainly because of the former radio activi-

ties of the church pastor, Father Charles E. Coughlin. Industry, which is of minor importance, includes tools, paint, hydraulic mechanisms, and automotive parts. (E. R. I.)

ROYAL SOCIETY, the oldest scientific society in Great Britain and one of the oldest in Europe. The Royal Society (more fully, The Royal Society of London for Improving Natural Knowledge) is usually considered to have been founded in 1660, but a nucleus had been in existence for several years before that date. As early as the year 1645 weekly meetings were held in London of "divers worthy persons, inquisitive into natural philosophy and other parts of human learning, and particularly of what hath been called the *New Philosophy* or *Experimental Philosophy,*" and there can be little doubt that this gathering of philosophers is identical with the "Invisible College" of which Robert Boyle speaks in sundry letters written in 1646 and 1647.

Some of these "philosophers," resident in Oxford about 1648, formed an association there under the title of the Philosophical Society of Oxford, and used to meet, most usually in the rooms of John Wilkins, warden of Wadham College. A close intercommunication was maintained between the Oxford and London philosophers; but ultimately the activity of the society was concentrated in the London meetings, held principally at Gresham College.

On Nov. 28, 1660, the first journal book of the society was opened with a "memorandum," from which the following is an extract:

> Memorandum that Novemb. 28, 1660, These persons following, according to the usuall custom of most of them, mett together at Gresham Colledge to heare Mr. Wren's lecture, viz., The Lord Brouncker, Mr. Boyle, Mr. Bruce, Sir Robert Moray, Sir Paul Neile, Dr. Wilkins, Dr. Goddard, Dr. Petty, Mr. Ball, Mr. Rooke, Mr. Wren, Mr. Hill. And after the lecture was ended, they did, according to the usuall manner, withdrawe for mutuall converse. Where amongst other matters that were discoursed of, something was offered about a designe of founding a Colledge for the promoting of Physico-Mathematicall Experimentall Learning.

It was agreed at this meeting that the company should continue to assemble on Wednesdays at three o'clock; an admission fee of 10*s.* with a subscription of 1*s.* a week was instituted; Wilkins was appointed chairman; and a list of 41 persons judged likely and fit to join the design was drawn up. On the following Wednesday Sir Robert Moray (or Murray) brought word that the king (Charles II) approved the design of the meetings; a form of obligation was framed and was signed by all the persons enumerated in the memorandum of Nov. 28 and by 73 others. On Dec. 12 another meeting was held at which 55 was fixed as the number of the society—persons of the degree of baron, fellows of the College of Physicians, and public professors of mathematics, physics, and natural philosophy of both universities being supernumeraries.

Gresham College was now appointed to be the regular meeting place of the society. Sir Robert Moray was chosen president (March 6, 1661) and continued from time to time to occupy the chair until the incorporation of the society, when Lord Brouncker was appointed the first president under the charter. In October 1661 the king offered to be entered one of the society, and next year the society was incorporated under its present title. The name "Royal Society" appears to have been first applied to the "philosophers" by John Evelyn, in the dedication of his translation of a book by Gabriel Naudé, published in 1661.

The charter of incorporation passed the great seal on July 15, 1662, to be modified, however, by a second charter in the following year, repeating the incorporating clauses of the first charter but conferring further privileges on the society. The second charter passed the great seal on April 22, 1663, and was followed in 1669 by a third, confirming the powers granted by the second charter, with some modifications of detail, and granting certain lands in Chelsea to the society. The council of the Royal Society met for the first time on May 13, 1663.

At this early stage of its history the "correspondence" which was actively maintained with continental philosophers formed an important part of the society's labours, and selections from this correspondence furnished the beginnings of the *Philosophical Transactions.* At first the publication of the *Transactions* was entirely "the act of the respective secretaries." The first number, consisting of 16 quarto pages, appeared on Monday, March 6, 1664/65, under the title of *Philosophical Transactions: giving some Accompt of the present undertakings, studies and labours of the Ingenious in many considerable parts of the world,* with a dedication to the Royal Society signed by Henry Oldenburg, the society's first secretary. The society also from its earliest years published, or directed the publication of, separate treatises and books on matters of philosophy, most notable among these being the *Philosophiae naturalis principia mathematica Autore Is. Newton. Imprimatur: S. Pepys, Reg. Soc. Praeses. Julii 5, 1686, 4to Londini 1687.*

In 1887 the *Philosophical Transactions* were divided into two series, labeled A and B, respectively, the former containing papers of a mathematical or physical character and the latter papers of a biological character. In 1832 appeared the first volume of *Abstracts of papers, printed in the Philosophical Transactions from the year 1800.* This publication developed in a few years into the *Proceedings of the Royal Society.*

One of the most important functions of the society at its inception was the performance of experiments before the members. In the royal warrant of 1663 ordering the mace which the king presented to the society, it is described as "The Royal Society for the improving of Natural Knowledge by experiments." The society early exercised the power granted by charter to appoint two "curators of experiments," the first holder of that office being Robert Hooke, who was afterward elected a secretary of the society.

Another matter to which the society gave attention was the formation of a museum, the nucleus being "the collection of rarities formerly belonging to Mr. Hubbard," which, by a resolution of council passed in 1666, was purchased for £100. This museum was presented to the trustees of the British Museum in 1781, upon the removal of the society to Somerset House. A certain number, however, of instruments and models of historical interest remained in the possession of the society, and some of them, more peculiarly associated with its earlier years, are still preserved at Burlington House. The remainder have been deposited in the Victoria and Albert Museum, South Kensington.

After the Great Fire of London in September 1666 the apartments of the Royal Society in Gresham College were required for the use of the city authorities, and the society was invited by Henry Howard (later duke of Norfolk) to meet in Arundel House. At the same time he presented them with the library purchased by his grandfather Thomas, earl of Arundel, and thus the foundation was laid of the important collection of scientific works, exceeding 140,000 volumes, which the society possesses. Of the Arundel manuscripts the bulk was sold to the trustees of the British Museum in 1831 for £3,559, the proceeds being devoted to the purchase of scientific books. These manuscripts are still kept in the British Museum as a separate collection. The society, however, still possesses a valuable collection of scientific correspondence, official records, and other manuscripts, including the original manuscript, with Newton's autograph corrections, from which the first edition of the *Principia* was printed.

Under date Dec. 21, 1671, the journal book records that "the lord bishop of Sarum proposed for candidate Mr. Isaac Newton, professor of the mathematicks at Cambridge." Newton was elected a fellow on Jan. 11, 1671 (old style; Jan. 21, 1672, new style), and in 1703 he was appointed president, a post which he held till his death in 1727. During his presidency the society moved to Crane Court, its first meeting in the new quarters being held on Nov. 8, 1710. In the same year its members were appointed visitors and directors of the Royal Observatory at Greenwich, a function which they continued to perform until the accession of William IV, when by the new warrant then issued the president and six fellows of the Royal Astronomical Society were added to the list of visitors.

In 1780, under the presidency of Sir Joseph Banks, the Royal Society removed from Crane Court to the apartments assigned to it by the government in the new Somerset House, where it remained until its removal to Burlington House in 1857. The policy of Sir Joseph Banks was to raise the status of the fellowship. A step in pursuance of the same policy was taken in 1847, when the number of candidates recommended for election by the council was limited to 15, and the election was made annual. This was augmented

to 20 in 1938, to 25 in 1945, and 32 in 1964. Concurrent with the gradual restriction of the fellowship was the successive establishment of other scientific bodies. The founding of the Linnean Society in 1788 under the auspices of several fellows of the Royal Society was the first instance of the establishment of a distinct scientific association under royal charter; and this was followed by the formation of many more societies to promote special branches of science.

From Charles II's reign onward British governments have constantly appealed to the Royal Society for advice in connection with scientific undertakings of national or supranational importance. The following are some of the principal matters of this character upon which the society has been consulted by, or which it has successfully urged upon the attention of, the government: the improvement and equipment of the Royal Observatory, Greenwich; the change of the calendar in 1751; ventilation of prisons; protection of buildings and ships from lightning; measurement of a degree of latitude; determination of the length of a seconds pendulum; comparison of the British and French standards of length; the Geodetic survey in 1784, and the General Trigonometrical survey begun in 1791; expeditions to observe the transits of Venus in 1761, 1769 (commanded by Capt. James Cook), 1874, and 1882; the Antarctic expeditions of 1772 (under Cook, whose voyage extended to the circumnavigation of the globe), 1839 (under Sir James Clark Ross), and 1900; help with the reports of the British Antarctic expedition of 1910–13; observations for determining the density of the earth; Arctic expeditions of 1817 (in search of the Northwest Passage), of 1819 (under Lieut. William Parry), of 1827 (Parry and Ross), of 1845 (under Sir John Franklin), of 1875 (under Capt. George Nares); numerous expeditions for observing eclipses of the sun; 1822, use of coal tar in vessels of war; best manner of measuring tonnage of ships; 1823, corrosion of copper sheathing by seawater; Charles Babbage's calculating machine; lightning conductors for vessels of war; 1825, supervision of gasworks; 1832, tidal observations; 1835, instruments and tables for testing the strength of spirits; magnetic observatories in the colonies; 1862, the great Melbourne telegraph; 1865, pendulum observations in India; 1866, reorganization of the meteorological department; 1868, deep-sea research; 1872, "Challenger" expedition; 1879, prevention of accidents in mines; 1881, pendulum observations; cruise of the "Triton" in Faeroe Channel; 1883, borings in delta of the Nile; 1884, Bureau des Poids et Mesures; international conference on a prime meridian; 1888, inquiry into lighthouse illuminants; 1890, the investigation of colour blindness; 1895, examination of the structure of a coral reef by boring; 1896, inquiry into cylinders for compressed gases; the establishment of an International Geodetic Bureau; 1897, determination of the relations between the metric and imperial units of weights and measures; an inquiry into the volcanic eruptions in the West Indies; international seismological investigation; international exploration of the upper atmosphere; measurement of an arc of the meridian across Africa. During 1913–17 the society completed a magnetic survey of the British Isles. In 1919 it sent two expeditions to observe the total solar eclipse of May 29, and to note any deflection of rays of light by the sun's gravitational field, as required by Albert Einstein's general theory of relativity. In later years also the society, acting at the request of the government, has taken the leading part in fruitful investigations into various tropical diseases, beginning with the tsetse-fly disease of cattle in Africa, followed by investigations into malaria, Mediterranean fever, and sleeping sickness. In 1924 it received a bequest of £10,000 for medical research on tropical diseases, etc., and sent an expedition to study kala azar in northern China. The society has also shown an active interest in problems of respiration and circulation in high altitudes (Peru expedition, 1921), and in investigations into glassworkers' cataract. It did much to promote the *International Catalogue of Scientific Literature* and the International Association of Academies.

In addition the Royal Society exercises a variety of important public functions of a more permanent nature. It still provides seven of the board of visitors of the Royal Observatory, has 11 representatives on the Joint Permanent Eclipse committee and has a Solar Research committee of its own. From 1877 until the reconstitution of the Meteorological Office in 1906 the society nominated the Meteorological council, which had the control of that office. The Gassiot and other committees of the society continued to cooperate with the Meteorological Office. Since 1919, when the Meteorological Office was attached to the Air ministry, the society has two representatives on the Meteorological committee. The society has the custody of standard copies of the imperial standard yard and pound. The president and council have the scientific control of the National Physical Laboratory, an institution established in 1900 as a result of representations from the Royal Society (financial control was transferred to the Department of Scientific and Industrial Research in 1918). It also appoints British delegates to meetings of the International Research council.

One of the most important duties which the Royal Society performs on behalf of the government is the administration of an annual grant for the promotion of scientific research and the assistance of scientific publications. This grant originated in a proposal by Lord John Russell in 1849 that at the close of the year the president and council should point out to the first lord of the treasury a limited number of persons to whom the grant of a reward or of a sum to defray the cost of experiments might be of essential service. The majority of these grants are utilized to provide apparatus, and they are made with the advice of eight scientific boards of eight experts each and a publications board.

A proposal for bursaries to assist investigators of proved ability to work in other parts of the Commonwealth of Nations for short periods when this would augment their capacity to advance knowledge was put forward by Sir Edward Salisbury in 1953. This was implemented as the Royal Society and Nuffield Foundation Bursaries scheme, and is mainly financed by the Nuffield Foundation and contributions from various countries of the Commonwealth. In 1962 five Royal Society research professorships were established by means of a special government grant; three more were added in 1964.

A statement of the trust funds administered by the Royal Society will be found in the *Year Book*, and the origin and history of these funds in the *Record of the Royal Society*.

Five medals (the Copley Medal, two Royal, the Davy, and the Hughes) are awarded by the society every year, the Rumford and the Darwin medals biennially, the Sylvester triennially, and the Buchanan quinquennially. The first of these originated in a bequest by Sir Godfrey Copley (1709) and is awarded "to the living author of such philosophical research, either published or communicated to the society, as may appear to the council to be deserving of that honour"; the author may be an Englishman or a foreigner. The Rumford Medal originated in a gift from Count von Rumford (Sir Benjamin Thompson) in 1796 for the most important discoveries in heat or light made during the preceding two years. The Royal medals were instituted by George IV and are awarded annually for the two most important contributions to science published in the British dominions not more than ten years nor less than one year before the date of the award. The Davy Medal was founded by the will of John Davy, F.R.S., the brother of Sir Humphry Davy, and is given annually for the most important discovery in chemistry made in Europe or Anglo-America. An enumeration of the awards of each of the medals and the conditions of the awards are published in the *Year Book*.

Six special lectures endowed by the benefactors named are delivered to the society, namely the Croonian (William Croone, 1684), the Bakerian (Henry Baker, 1775), and the Ferrier (Sir David Ferrier, 1928), to be delivered triennially, on the advances in knowledge of the structure and function of the brain; the Wilkins (J. D. Griffith Davis, 1947) on the history of science; the Leeuwenhoek (George Gabb, 1948) on some microbiological subject; and, in 1952, lectures in memory of Lord Rutherford.

Under the existing statutes of the Royal Society every candidate for election into the society must be recommended by a certificate in writing signed by six or more fellows, of whom three at least must sign from personal knowledge. From the candidates so recommended the council annually selects 32, and the names so selected are submitted to the society for election by ballot. Princes

of the blood, however, and not more than 2 persons selected by the council on special grounds once in two years, may be elected by a more summary procedure. Foreign members, not exceeding 50, may be selected by the council from among men of the greatest scientific eminence abroad, and proposed to the society for election.

The anniversary meeting for the election of the council and officers is held on St. Andrew's Day. The council for the ensuing year, which includes the president, treasurer, two scientific secretaries (one for the biological and one for the physical sciences), and a foreign secretary, must consist of 11 members of the existing council and 10 fellows who are not members of the existing council. These are nominated by the president and council previous to the anniversary meeting. The president and foreign secretary normally hold office for five years, the two scientific secretaries and the treasurer for ten years. There is also a permanent executive secretary who is not usually a fellow. The session of the society is from November to June; the ordinary meetings are held on Thursdays during the session at 4:30 P.M. The selection for publication from the papers read before the society is made by the Committee of Papers, which consists of the members of the council for the time being aided by committees appointed for the purpose. The papers so selected are published in the society's *Philosophical Transactions* (quarto) or *Proceedings* (octavo).

(R. W. F. H.; A. Wo.; E. J. S.)

ROYALTY, the payment made to the owners of certain types of rights by those who are permitted by the owners to exercise the rights. The rights concerned are literary, musical, and artistic copyright, rights in inventions and designs, and rights in mineral deposits, including oil and natural gas. The term originated from the fact that in Great Britain for centuries gold and silver mines were the property of the crown; such "royal" metals could be mined only if a payment ("royalty") were made to the crown. (*See* also COPYRIGHT; PATENT; PUBLISHING.)

It is uncommon for the author of a book to be in a position to exploit it fully himself: he requires the resources of a publishing organization. Similarly, a playwright needs the services of a theatrical management and actors to perform his play and a publisher to produce and sell copies. A musical composer must arrange for the performance of his work, for the sale of copies, and for the making of recordings. An artist, if he wants to make any profit from a picture beyond the price he obtains for it, must arrange for reproductions to be published in books and as prints. An individual inventor without capital or plant must license others to manufacture his invention. When owners of rights make arrangements for such exploitation by others the remuneration they receive in exchange is often in the form of a royalty, usually based on the actual extent of the exploitation.

Mineral deposits have nothing in common with the fruits of intellectual and artistic endeavour, the subject of the other rights mentioned above, except that they are often exploited by persons other than the owners upon payment of royalties.

Literary and Musical Works.—*Books.*—Payment in the form of royalties based on a percentage of the published price of the work is the customary method of sharing receipts between author and publisher. Generally the royalty is 10% of the published price, rising to 15 or 17½% according to the number of copies sold. This method is much fairer to both parties than the older system of outright payment by the publisher for all rights in the books he agreed to publish. The rate of royalties depends upon the cost of production and advertising and the estimated sales and also on the respective bargaining powers of author and publisher. It is usual for the publisher to agree to pay an advance of royalties either upon the signing of the agreement, upon delivery of the manuscript, or upon publication date. Authors whose previous books have sold well command proportionately large advances. In addition to providing for the periodic rendering of accounts by the publisher and for inspection of account books by the author, agreements normally deal expressly with the responsibilities of the parties regarding all matters affecting the efficient production of the book. Sometimes the publisher is given an option to acquire rights in subsequent books by the author.

Agreements for the publication of fictional works in the United States and Great Britain almost invariably give the publisher control of anthology, digest, and paperback rights and provide for the sharing of the proceedings of exploitation of these rights. Translation rights, film rights, dramatization rights, and broadcasting rights are usually retained by the author and disposed of separately. For some of these rights lump sum payments are more appropriate than royalties.

Plays.—Agreements between playwrights and theatre managements for professional productions normally provide for the payment of royalties on the box-office receipts after certain deductions. Translation rights, performing rights in other countries, and film and broadcasting (radio and television) rights may or may not be dealt with in the initial agreement, the terms of which depend greatly upon the standing and bargaining power of the playwright. If reading and acting editions of the play are published the publishers will pay royalties to the playwright. The publisher of the acting edition usually controls the amateur performing rights and sometimes other rights, such as repertory rights, as well. Royalties for amateur performances may be on a sliding scale but are usually a fixed sum for each performance, possibly with a reduction for second and subsequent performances. The exploitation of rights in plays is normally timed so that a film is not produced while the first stage production is still running.

Music.—The full exploitation of the copyright in a musical work is a complex matter and ordinarily depends on both the nature of the work and the position and reputation of the composer. At one time, unless a work had been commissioned, the first step was to secure the interest of a music publisher who would publish the sheet music, in those days often the most fruitful source of revenue. Now, the first step may well be to arrange for a public performance or a broadcast, and it is likely that recordings will be made very soon afterward, probably with the performers who give the first public performance. The popularity of performing groups in the field of popular music often waxes and wanes rapidly and exploitation of music which is associated with particular groups is usually intensive. The pace is slower for serious works. Once a work of any kind has become popular with the public the composer, acting alone, could have no expectation of collecting the performing royalties due to him in respect of the performances of his work in innumerable places all over the world. To deal with this situation collecting societies have been formed in most countries. The oldest such society in Great Britain is the Performing Right Society. In the United States the American Society of Composers, Authors and Publishers (ASCAP) was formed in 1914 and Broadcast Music, Inc., in the early 1940s after dissension between radio broadcasters and ASCAP. The two organizations compete. National collecting societies have reciprocal arrangements for collection of royalties in respect of performances in other countries. In Great Britain most composers, authors, and publishers of musical works assign their performing rights to the Performing Right Society, which has a staff of inspectors, collects fees, and restrains unauthorized performances. After deduction of the costs of administration the fees collected are divided between the members. Licensees submit returns of performances and the division of the fees depends upon the number of times a particular work has been performed and upon the nature of the work, a weighting system being in operation to give serious but less popular music a larger share than would otherwise be the case. Other national societies operate similarly.

Composers also receive royalties from recording companies. In

Great Britain, once a licence to record has been given, others may record the work concerned on payment of a prescribed royalty to the copyright owner. Public performance of records is controlled by another collecting society, Phonographic Performance Ltd., which issues licences and collects fees. Licences are not usually granted for performances at functions at which bands have previously been or would normally be engaged.

Two other British collecting societies, the Mechanical Copyright Protection Society and the Sound Film Music Bureau, are associations of owners of musical copyright concerned with the exercise of recording rights in connection with the making of gramophone records and film sound tracks. (J. N. B. P.)

Historical Background.—The royalty system came into general use only in the 19th century, although before that authors were occasionally paid a stipulated sum for the first printing of a book, and a further sum if another printing was called for. Samuel Simmonds paid Milton £5 for *Paradise Lost* and agreed to pay a further £5 at the end of the sale of each of the first three printings. Richard Baxter, the noted 17th-century English Puritan minister, records that when he arranged with Thomas Underhill and Francis Tyton to publish his *Saints' Everlasting Rest*, a quarto of nearly 1,000 pages, the publishers agreed to pay him £10 for the first printing and £20 for every subsequent printing up to the year 1665.

The Shakespearean scholar Sidney Lee records that the highest price known to be paid before 1599 to an author for a play by the manager of an acting company was £11. "A small additional gratuity, rarely exceeding 10*s*., was bestowed on a dramatist whose piece on its first production was especially well received, and the author was customarily awarded, by way of benefit, a certain proportion of the receipts of the theatre on the production of a play for the second time. The 19 plays which may be set to Shakespeare's credit between 1591 and 1599 combined with such revising work as fell to his lot during those nine years cannot consequently have brought him less than £200 or some £20 a year. Between 1599 and 1611 his remuneration as both actor and dramatist was on the upward grade. The fees paid dramatists rose rapidly. The exceptional popularity of Shakespeare's work after 1599 gave him the full advantage of the higher rates of pecuniary reward in all directions. The 17 plays that were produced by him between that time and the close of his professional career could not have brought him less on an average than £25 each, or some £400 in all." Later prices improved and Fielding, for example, received £1,000 from Andrew Millar for *Amelia*, while Gibbon received two-thirds of the proceeds on his history.

Edward Chapman, of Chapman and Hall, in a letter to John Forster, the biographer of Charles Dickens, said: "There was no agreement about *Pickwick* except a verbal one. Each number was to consist of a sheet and a half, for which we were to pay 15 guineas, and we paid him for the first two numbers at once, as he required the money to go and get married with. We were also to pay more according to the sale, and I think *Pickwick* cost us altogether £3,000." Forster adds: "I had always pressed so strongly the importance to him of some share in the copyright that this at last was conceded in the deed above mentioned (though five years were to elapse before the rights should accrue) and it was only yielded as part consideration for a further agreement entered into on the same date (Nov. 19, 1837) whereby Dickens engaged to write a new work (*Nickleby*) the first number of which was to be delivered on the 15th of the following March and each of the numbers on the same day of each of the successive 19 months, which was also to be the date of the payment to him by Chapman and Hall, and 20 several sums of £150 each for five years' use of the copyright, the entire ownership in which was then to revert to Dickens."

On July 2, 1840, Dickens wrote to Chapman and Hall: "Your purchase of *Barnaby Rudge* is made upon the following terms: It is to consist of matter sufficient for ten monthly numbers of the size of *Pickwick* and *Nickleby*, which you are, however, at liberty to divide and publish in 15 smaller numbers if you think fit. The terms for the purchase of this edition in numbers and for the copyright of the whole book for six months after the publication of the last number are £3,000. At the expiration of six months, the whole copyright reverts to me." (C. Bn.; X.)

Inventions.—As to inventions, a royalty may be said to be a compensation paid under a licence granted by the owner of a patent ("the licensor") to another person ("the licensee") who wishes to make use of the invention, the subject of the patent. The patent remains the property of the licensor. A licence may be exclusive, in which case the patent owner precludes himself from granting licences to third parties, or nonexclusive, in which case the patent owner may grant licences to as many persons as he wishes. The granting of licences and the payment of royalties thereunder are purely a matter of contract between licensor and licensee. It is essential that all relevant matters be provided for in the contract, especially the amount of royalties, and the precise method of computing them. A licence may be limited or not, according to the intentions of the parties. It may be limited to certain purposes or to geographical areas or in any other way permissible under the national laws having jurisdiction over the transaction. It will normally be for the full term of the patent.

A royalty may be a single payment covering the whole use of the patent for the whole term, but the more usual practice is to make periodic payments and to relate the amounts of those payments to the actual use of the patent by the licensee. It is common to charge royalties on the basis of a percentage of the price for which the licensee sells the articles or on the basis of the number of the articles made under the patent. Although the amount of royalties is generally a matter of free bargaining between licensor and licensee, in some countries governments preclude their nationals from paying royalties to foreign patent owners in excess of a certain maximum fixed by the government. Some governments also reserve the right to approve the entire licence contract concluded between their nationals and aliens.

Royalty payments may be in exchange for something in addition to the mere use of the invention. The most common example is that wherein the licensor not only grants the right to use the invention but also undertakes to supply the licensee with technical "know-how," that is to say, information from his own experience on the most economical and efficient way of working the patent. It is estimated that more than 50% of licence contracts include "know-how" provisions.

Designs.—When applied to industrial designs, the meaning of the word royalty is roughly the same as in the case of patented inventions. Designs, depending on their nature or the various national laws, may be protected by patents, copyright, or registration. The form of legal protection, however, does little to change the system of royalty payment as described in regard to patents. (R. Wo.)

Mining and Mineral Operations.—Mineral royalty is payment to the mineral owner partly as consideration for the right of exploitation, partly as compensation for the exhaustion of an irreplaceable asset, and tends therefore to be proportionate to the net value of the product. Though the word "minerals" includes petroleum and natural gas, their peculiar modes of occurrence and of exploitation warrant their separation from ores and nonmetallics for royalty purposes. Depending on the country, ownership may be vested in the state, as in Communist countries; in the surface owner, as is virtually the case in the United States; or in a dual system, as in Great Britain, where mineral ownership is vested in the surface owner subject to ancient customs in certain areas and to state ownership of coal and petroleum. The miner's title is seldom equivalent to a fee title but is a bundle of rights and obligations, the composition of which varies greatly from country to country. Exceptionally, as in France, mineral exploitation rights are granted by government in perpetuity without payment of royalty, though a ground rent unrelated to production or profitability is paid to the surface owner to compensate him for the loss of certain statutory rights. More generally, royalties are negotiated and leased for a fixed period and are assessed in accordance with one of three principles. (1) A fixed sum per ton (solid materials, *e.g.*, gypsum) or cubic yard (unconsolidated materials such as sand and gravel) is the simplest system and is usual for nonmetallics but is not applicable to ores because of fluctuations in grade (*i.e.*, percent content of metal). (2) A sliding scale

charge based on the value of the product is the most common method for ores. Its simplest form, a fixed percentage of selling price, has a linear effect, but an exponential element may be introduced by the use of a formula or by a schedule of graduated charges. A "certain" or "dead" rent, *i.e.*, a minimum annual payment, is occasionally specified and can sometimes be deducted from the gross royalty payment. A surface rental may likewise be charged and deducted from the gross payment. (3) Royalty may be based on the profitability of the operation, more commonly in the oil industry than in mining.

Oil and gas royalties are less variable in application. Following the example set by Venezuela, a 50–50 profit-sharing basis has become the standard pattern in South American countries and in the Middle East. The United States distinguishes between "competitive" leases (on a known producing geological structure), which pay royalty of 12–25% of the value of the oil and 12½–16⅔% of the value of the gas; and "noncompetitive" leases in virgin areas, where the royalty when production begins is 12½%. In some other countries, natural gas bears a fixed charge per 1,000 cu.ft. Great Britain is not a significant oil producer, but for continental shelf operations in the North Sea has adopted the principle of an area rental of £25–£290 per square kilometre which is deductible from a royalty of 12½% of the wellhead value of the product.

ROYCE, SIR (FREDERICK) HENRY, 1ST BART. (1863–1933), British engineer, designer of Rolls-Royce cars and airplane engines, was born at Alwalton, Huntingdonshire, on March 27, 1863. At 15 he was an engineer apprentice to the Great Northern Railway company at Peterborough, and in 1882 he was chief electrical engineer for the first electric street-lighting system in Liverpool. In 1884 he started his own engineering business in Manchester, which developed into Royce Ltd., manufacturers of electrically driven cranes, dynamos and motors. In 1903 he built three experimental cars of his own design, the outstanding qualities of which came to the attention of motor dealer C. S. Rolls (*q.v.*), who soon agreed to take his whole output. Their firms were combined in 1906 as Rolls-Royce, Ltd.; the motor section of the business was moved to Derby in 1908. Royce was made a baronet in 1930. He died at West Wittering, Sussex, on April 22, 1933.

See Sir Max Pemberton, *The Life of Sir Henry Royce* (1934).

(ST. J. C. N.)

ROYCE, JOSIAH (1855–1916), U.S. philosopher and teacher, was born at Grass Valley, a California mining town, on Nov. 20, 1855. At 16 he entered the newly opened University of California, inclined to the study of engineering. But the teachings of the geologist Joseph LeConte and of the poet Edward Rowland Sill roused his extraordinary speculative power; and on receiving his baccalaureate degree in 1875, he gave himself to the study of philosophy, first in Leipzig and Göttingen, Ger. (under R. H. Lotze) and then, as one of the first fellows of Johns Hopkins university, with William James and Charles Peirce. There, he received the degree of Ph.D. in 1878. After teaching English for four years at the University of California, he was called to Harvard university as lecturer in philosophy, becoming assistant professor in 1885, professor in 1892 and succeeding George Herbert Palmer as Alford professor in 1914. He received various honorary degrees and in 1916 was made honorary fellow of the British Academy. He died at Cambridge, Mass., Sept. 14, 1916.

Royce's effect as teacher and writer was profound: no previous U.S. thinker had so united moral energy with wide historical learning, command of scientific method and intense interest in logical technique. His versatile mind concerned itself effectively with a wide range of subjects; he contributed to mathematical logic, psychology, social ethics, literary criticism and history, as well as to metaphysics. His thought was massive and intimately human; yet it was sustained with a dialectical skill of such evident virtuosity as, on the one hand, to excite the critical opposition first of pragmatic and then of realistic schools, and, on the other hand, to set a new standard in the systematic treatment of philosophy. In this latter respect, Royce did for U.S. philosophy what his older contemporary F. H. Bradley (*q.v.*) did for British philosophy; in many ways the views of these thinkers are akin. Like Bradley, Royce teaches a monistic idealism. Scientific laws he describes—anticipating certain developments of later physics—as statistical formulas of average behaviour. His absolute idealism is supplemented, not corrected, by the ethical and social teachings of his later years and, in particular, by the conception of the world of human selves as the Great Community, the literally personal object of moral loyalty (*see* IDEALISM).

Among Royce's more important publications (selected from a far greater number) are: *The Religious Aspect of Philosophy* (1885); *The Spirit of Modern Philosophy* (1892); *The Conception of God*, with supplementary essay (1897); *Studies of Good and Evil* (1898); *The World and the Individual* (Gifford Lectures), volumes I and II (1900–01); *The Conception of Immortality* (1900); *Outlines of Psychology* (1903); "The Relations of the Principles of Logic to the Foundations of Geometry," in *Transactions of the American Mathematical Society*, volume VI, 3 (1905); *The Philosophy of Loyalty* (1908); *The Sources of Religious Insight* (1912); *The Problem of Christianity* (lectures delivered at Lowell institute, Boston, Mass., and at Manchester college, Oxford Eng.), volumes I and II (1913); "The Mechanical, the Historical and the Statistical," *Science*, New Series XXXIX (1914); *Lectures on Modern Idealism* (1919). For a bibliography (exclusive of posthumous publications) *see* B. Rand, *Philosophical Review*, volume XXV (1916) and *Royce's Logical Essays*, edited by D. S. Robinson (1951).

(M. W. C.; W. E. H.)

ROYER-COLLARD, PIERRE PAUL (1763–1845), French statesman and philosopher, a moderate partisan of the Revolution who became a liberal Legitimist and the exponent of a realist psychology sometimes described as "spiritualism." He was born on June 21, 1763, at Sompuis in Champagne, the son of a small proprietor. Brought up in a strongly Jansenist atmosphere, he went to schools of the Brothers of the Christian Doctrine. In 1787 he began practice as a lawyer in Paris. During the French Revolution he was elected to the Paris commune by the Île Saint-Louis in 1790 and was its secretary till the insurrection of Aug. 10, 1792. After the overthrow of the Girondins (summer 1793) his life might have been in danger, and he retired to Sompuis, where he was not molested. In 1797 he was elected by the Marne *département* to the Council of Five Hundred, in which he made a great speech demanding justice, that is, freedom, for the Catholic clergy; but after the *coup d'état* of 18 Fructidor (Sept. 4) his election was annulled. Invited to send clandestine reports on French internal affairs to the exile Louis XVIII, he became a member of the "secret royal council" constituted on Feb. 23, 1800. Though this soon dissolved itself, he seems to have continued sending his reports till 1803.

For the next ten years Royer-Collard was mainly devoted to philosophy. While his education had familiarized him with the great 17th-century thinkers (Descartes, the Cartesians, Antoine Arnauld, and Leibniz), he was immediately concerned to refute the sensationism of Condillac (*q.v.*). For this purpose he developed a "philosophy of perception" which owed much to Thomas Reid (*q.v.*). The existence of the external world, duration, and causality, he argued, are realities known to us through "consciousness" and memory, not through the senses, which reveal only extension and solidity. The "false philosophy" of skepticism had to be combated both for the sake of society as a whole and for that of individual happiness. In 1811 he was appointed professor of the

history of philosophy at the Imperial University (the Sorbonne).

Under the First Restoration (1814), Louis XVIII made Royer-Collard director of the book trade (supervisor of the press) and a counselor of state, with particular responsibility for public education. Under the Second Restoration (1815) Royer-Collard retained these posts and was elected by his old *département* to the Chamber of Deputies. At first a supporter of royal authority as the basis of all order, he soon developed a theory of liberal monarchy or Legitimist democracy which made him a critical opponent of the more reactionary ministers. These views, together with his philosophical program, made him the moving spirit of the Doctrinaires (*q.v.*). He resigned his control of education in 1819 and was dismissed from the council of state in 1820.

Constantly reelected deputy, Royer-Collard became president of the Chamber in 1828. As such he presented the protest of the 221 deputies (March 18, 1830) against Charles X's arbitrary appointment of Prince Jules de Polignac as prime minister. After the July Revolution of 1830 he remained a deputy till 1842, but as a Legitimist he could not sympathize with the new regime. He died at Châteauvieux (Loir-et-Cher) on Sept. 4, 1845. Philosophically his most important disciple was Victor Cousin (*q.v.*).

See Prosper de Barante, *La Vie politique de M. Royer-Collard,* 2 vol., 3rd ed. (1878); R. Langeron, *Un conseiller secret de Louis XVIII, Royer-Collard* (1956).

ROZANOV, VASILI VASILIEVICH (1856–1919), Russian critic, essayist, and mystic, whose works are highly original in thought and style, was born at Vetluga, Kastroma province, in 1856. He studied at Moscow University and became a teacher of history and geography in provincial secondary schools. He attracted attention in 1890 with a critical analysis of the "Legend of the Grand Inquisitor" chapter in *The Brothers Karamazov,* the first of many depth studies of Dostoevski. In such works as *V mire neyasnago i nereshennago* ("In the Realm of Riddle and Mystery," 1901), *Russkaya Tserkov* ("The Russian Church," 1906), and *Ludi lunnago sveta* ("Moonlight Men," 1913), he attacked Christianity as an essentially ascetic religion and developed his own theories of a naturalistic religion of sex and procreation. During the 1905 revolution, he was attracted by the revolutionary movement, which he praised in *Kogda nachalstvo ushlo* ("When the Authorities Were Away," 1910). His *Vedinennoe, pochti na pravakh* ("Solitary Thoughts, Printed Almost Privately"; translated as *Solitaria,* 1927), written in 1912, is generally considered his most important book: its original style—which reflects the freedom, variety, and rhythms of speech—is equaled by originality of thought. *Opavshie listya* (1913, 2nd series, 1915; English translation, *Fallen Leaves,* 1929) is in the same form.

After 1917, Rozanov lived at the Troitski monastery near Moscow. He there wrote *Apokalipsis nashego vremeni* ("Apocalypse of Our Time," 1918–19), and before his death, on Feb. 5, 1919, was reconciled to the Orthodox Church.

ROZAS, JUAN MARTINEZ DE (1759–1813), the earliest leader in the Chilean struggle for independence, was born at Mendoza in 1759. In early life he was a professor of law, and of theology and philosophy at Santiago.

He was acting governor of Concepción at one time, and was also colonel in a militia regiment. In 1808 he became secretary to the last Spanish governor, Francisco Antonio Carrasco, and used his position to prepare the nationalist movement that began in 1809. After resigning as secretary, Rozas was mainly responsible for the resignation of the Spanish governor, and the formation of a national junta on Sept. 18, 1810, of which he was the real leader. Under his influence many reforms were initiated, freedom of trade was established, an army was organized, and a National Congress was called in July 1811. Rozas died at Mendoza, March 3, 1813.

RUANDA (BANYARUANDA, WANYARUANDA, RWANDA), an east African people belonging to the Interlacustrine Bantu. Their home lands are in the Republic of Rwanda, the northern portion of the former United Nations trust territory of Ruanda-Urundi. In the mid-1960s about 2,900,000 Ruanda occupied an area of roughly 10,000 sq.mi. (26,000 sq.km.), yielding one of the highest over-all population densities in Africa. Severe food shortages have resulted in large-scale migrations to neighbouring territories.

The people are divided into two main socio-racial groups: the Hutu (Bahutu), the shorter and darker-skinned group, a subordinate majority of cultivators of plantains, millet and sweet potatoes; and the Tutsi (Batutsi), an aristocratic minority of taller, lighter-skinned pastoralists. A third group, the pygmy Twa (Batwa), are hunters and potters. In former times, intermarriage among these groups was forbidden. The ruler, the *mwami,* administered the kingdom through a hierarchy of Tutsi chiefs and military captains bound to him by clientship. These, in turn, ruled and drew tribute from local communities of Hutu agriculturalists. Although the Ruanda shared a common language and formed a single polity under the *mwami,* the occurrence of Hutu revolts, both before and after the establishment of colonial rule in 1907, shows that the superiority of the Tutsi was not always accepted by the Hutu.

Traditionally, the Ruanda believe in a supreme creator-god, Imana, and in a first ancestor, Kazikamuntu, whose three children, Gatutsi, Gahutu and Gatwa, were the ancestors of the three castes. Communication with these, as well as with ancestors and other spirit beings, takes place through spirit-possession by mediums.

RUANDA-URUNDI was until 1962 a United Nations trust territory in eastern equatorial Africa administered by Belgium. In that year its two parts achieved independence, the northern part as the republic of Rwanda (*see* RWANDA) and the southern part as the kingdom of Burundi (*q.v.*). This article deals with the history of the territory up to the time of independence.

AT LEFT, TUTSI TRIBESMAN; RIGHT, A PYGMY OF THE TWA CLASS

The kingdoms of Ruanda and Urundi were founded by Tutsi people from Ethiopia who subdued the Hutu. Ruanda seems to have been a powerful state in the 14th century, and the history of its kings, or *bami* (singular *mwami*), is known from traditions describing their wars and tribal struggles. Ruanda-Urundi came within the German sphere of influence in 1890 as part of German East Africa. Although a military post was established at Usumbura on Lake Tanganyika, German control was slight and there was no occupation.

During World War I Ruanda-Urundi fell into Belgian hands, and in 1924 Belgium formally accepted the administration under a mandate of the League of Nations, which was replaced by a United Nations trusteeship in 1946. While retaining its identity and a separate budget, the territory was in 1925 linked to the Belgian Congo by an administrative union. But within Ruanda-Urundi, the Belgians held more to the principles of indirect rule. Each native kingdom remained separate, with its own sovereign, justice, administration, and taxation. The feudal structure and the dominant position of the Tutsi remained, although the Belgians

progressively eliminated the more medieval features of the regime and latterly sought to establish a more democratic atmosphere, which implied the political emancipation of the Hutu.

In 1959 tribal war in Ruanda caused the expulsion or departure of many of the Tutsi, and the *mwami* Kigeri V later went into exile. In the same year Belgian reforms were introduced to prepare the territory for independence, and in 1960 provisional governments were set up. Hutu parties won the 1960 communal elections in both kingdoms. As a result of an internal *coup d'état* in January 1961, Ruanda declared itself a republic and deposed Kigeri; in Urundi the provisional government agreed to exercise power jointly with the *mwami* Mwambutsa IV. Elections held the following September under United Nations supervision again were won by the Hutu in Ruanda but by a predominantly Tutsi party in Urundi. The two states rejected a United Nations proposal to federate.

Both countries attained complete independence on July 1, 1962, as Rwanda and Burundi. (JE. S.)

RUBBER is the substance caoutchouc (*q.v.*), a milklike fluid that is obtained from certain tropical shrubs or trees and then subjected to various processes of manufacture; or it may be a product of chemical synthesis. Beginning in the 19th century with the crudest manufacturing methods and equipment, the rubber industry has undergone continuous and dramatic change to become one of the most complex industries of modern times and an indispensable part of all mechanical civilization. Especially dramatic has been the manner in which rubber was first obtained from the relatively inaccessible forests of the Amazon valley, then from the plantations of the east and, since World War I, increasingly by syntheses.

I. HISTORICAL DEVELOPMENT

1. Earliest References.—India rubber, or caoutchouc, has been known in Europe since the discovery of the new world. The first European to describe the elastic gum was Pietro Martyre d'Anghiera (1457–1526), chaplain to the court of Ferdinand of Aragon, Castile and Léon and his wife Isabella, who, in his *De Orbo Novo* (1530 edition), describes an Aztec game played with balls "made of the juice of a certain herbe . . . [which] being stricken upon the ground but softly [rebounded] incredibly into the ayer." Other early references are contained in the work of Antonio de Herrera y Tordesillas, historian to Philip II of Spain (1556–98), who told how Columbus on his second voyage to the new world in 1493–96 saw balls "made of the gum of a tree" being used by the Indians of Haiti (*General History of the Vast Continent and Islands of America*, trans. by J. Stevens, 1725). The first mention of rubber being used for purposes other than sport was made by F. Juan de Torquemada in *De la Monarquia Indiana* (1615). He related how the Indians, having gathered the milk from incisions made in the various trees, brushed it onto their cloaks; and they obtained crude footwear and bottles by coating earthen molds and allowing them to dry. He also made reference to the use of a medicinal oil obtained by distillation.

In the 18th century rubber from the East Indies began to be used in Europe to rub out lead pencil marks—hence "india rubber."

2. First Scientific Descriptions.—The first serious accounts of rubber production and the primitive native system of manufacture were given in the 18th century by two Frenchmen, Charles Marie de la Condamine and François Fresneau. De la Condamine, a member of a French geographical expedition sent to South America in 1735, described caoutchouc, in a report to the French academy in 1736, as the condensed juice of the *Hevea* tree. The results of Fresneau's more comprehensive researches were presented to the academy as a memoir by de la Condamine in 1751. The first accurate account of the botanical characteristics of the *Hevea* species was given by the agricultural chemist J. C. Fusée-Aublet in 1775.

3. Origins of the Industry in Europe.—At the outset, not chemical knowledge but the ability to devise a suitable method of rubber manipulation was of paramount importance to the development of the rubber industry. It was two other Frenchmen, L. A. P. Herissant, a physician, and Pierre Joseph Macquer, a chemist, who first attempted to employ caoutchouc in Europe. Their efforts in the 1760s to discover a cheap and effective solvent for the crude mass of rubber brought from South America—usually in cakes and balls—were not entirely successful, although they are to be credited with introducing the use of turpentine and pure ether as solvents; by this imperfect means some of the earliest rubber surgical instruments were made.

The greatest progress in the easy manipulation of rubber came at the beginning of the 19th century from the experiments of a Scottish chemist, Charles Macintosh (1766–1843), and an English inventor, Thomas Hancock (1786–1865). The solvents they used, normally turpentine or camphene, were expensive and imperfect and the dissolved rubber was applied without the aid of machinery in a manner almost as primitive as that used by the natives themselves. Macintosh's contribution was the rediscovery, about 1820, of the use of coal-tar naphtha as a cheap and effective solvent. His experiments proving a success, Macintosh placed the resulting solution of rubber and naphtha between two fabrics and in so doing avoided the sticky or brittle surfaces that had been common in earlier single-texture garments treated with rubber. Manufacture of these double-textured waterproofed cloaks, henceforth to be known in English under the misspelling "mackintoshes," began in the Glasgow area and was later removed to Manchester. The work of Hancock, who became Macintosh's colleague and partner, is of even greater importance. Convinced that "something must eventually be done with so singular a substance," he first attempted to

dissolve the rubber with turpentine, but his hand-coated fabrics were unsatisfactory in surface and smell. He then turned to the production of elastic thread. Strips of rubber were cut from the imported lumps and applied in their crude state to clothing and footwear. On April 29, 1820, he obtained an English patent (No. 4451) for this process. In the same year, in an effort to find use for his waste cuttings, he introduced his famous masticator, which became the model for the much larger rubber masticators that followed. Constructed of a hollow wooden cylinder equipped with teeth in which a hand-driven spiked roller was turned, this tiny machine, originally taking a charge of two ounces of rubber, fulfilled Hancock's greatest hopes. Instead of the masticator's tearing the rubber to shreds, as he thought it might do, the heat of friction welded together the scraps of rubber, which could then be applied in further manufacture. This was only the first of many important successes; in 1820–47 Hancock took out 16 patents.

Although the efforts of Macintosh and Hancock had resolved the initial problem of manipulating the raw material, there could be no rapid extension of the use of india rubber until one further obstacle had been overcome—the effect of temperature on natural rubber, which softens with heat and hardens with cold. The solution of this problem was bound up with the progress of manufacturing methods in the United States (see *Charles Goodyear and the Discovery of Vulcanization*, below).

4. Origins of the Industry in the United States.—The establishment of the rubber manufacturing industry took place toward the end of the commercial and industrial expansion of 1819–37. Formerly rubber had been largely a curiosity (the estimated net imports into the U.S. in 1830 being 160 long tons), although attempts had been made to imitate the crude native-manufactured shoes imported from South America. With the quickening of the economy in the 1830s numerous factories came into operation along the waterfalls of the eastern seaboard. Later, in the prosperity following the gold discoveries of 1848, efforts were made to extend the use of rubber from footwear to clothing and machinery.

Pioneer Machinery.—U.S. attempts to reduce rubber to a plastic state with the aid of machinery followed along lines other than those followed in Britain. Instead of the rubber's being mixed inside a chamber, as with Hancock's masticator, it was compressed by passing it between wooden or iron cylinders. The earliest U.S. patent (April 10, 1820) for rubber machinery was that secured by John J. Howe for a grinding, or mixing, mill consisting of two heavy iron rolls. In 1836 Edwin M. Chaffee took out a patent for a much more important mill and a spreading machine. Chaffee's invention, foreshadowed in Howe's patent and owing a good deal to the earlier efforts of the U.S. rubber pioneers Nathaniel and Martin Hayward, represented the culmination of a series of experiments extending over many years. His two-roll mill, one roll being 6 ft. long and 27 in. in diameter, the other the same length but only 18 in. in diameter, compressed the rubber and aided the compounding process. In this respect it followed the pattern of earlier inventions. Unlike them, however, Chaffee's rolls were steam heated to about 200° F. and they ground and mixed the rubber either without the addition of solvents or by using only a limited amount. The calender, or coating machine, included in this patent set the pattern for calenders beyond the mid-20th century. Built in 1837 at a cost of $30,000 and weighing 30 tons, Chaffee's invention was called the "Monster" because of its great size. With four 6-ft.-long steam-heated rolls of varying diameter, built one above another, it was the biggest machine operating in the rubber industry at that time. After the rubber had been ground and mixed in the mill, it was fed into this machine together with the cloth to be proofed. The revolving cylinders possessed such tremendous power that they forced a thin film of rubber into the fabric. Apart from the economies in labour costs and the speeding-up of the whole process of manufacture, the calender, which before vulcanization could be regarded as the final machine employed in the manufacturing process, meant in certain instances the almost total elimination of the use of solvents.

Charles Goodyear and the Discovery of Vulcanization.—Although the industry had received a fillip from the mechanical progress made in rubber technology, this did not stave off a recession when the inherent faults of the early manufactured rubber became apparent. It softened with heat and hardened with cold (particularly in the more extreme climate of the United States); it was tacky, odorous and perished easily. These fundamental weaknesses were removed by the discovery of the vulcanization process in 1839 by the U.S. inventor Charles Goodyear (*q.v.*; 1800–60).

Becoming interested in the manufacture of rubber while still a young man, Goodyear—unaided at the outset by any chemical knowledge—continued these experiments until his death. His innumerable experiments with india rubber are described in his book *Gum-Elastic* (vol. i, 1855; vol. ii, 1853). His invaluable compound of rubber, lead and sulfur was at first called "heated" or "fireproof" gum, but afterward "vulcanized" rubber. The effect of the invention was to impart to rubber a durable quality that it had not hitherto possessed. Previously the backbone of the rubber industry had been the proofing of fabric (largely British) and the making of overshoes (largely U.S.) but now, while the use of rubber in the unvulcanized state continued on a by-no-means insignificant scale, Goodyear's discovery made possible the future rise of the mechanical trade (the use of rubber with machinery) and of the bicycle and automobile tire industry. In an attempt to raise capital to carry forward his other experiments, he sent the first samples of the "improved rubber" to England. These samples came to the notice of Thomas Hancock, who was able to appreciate what had been achieved and who worked unceasingly for more than a year to discover their secret. Eight weeks before Goodyear, dogged by ill health and in sore financial straits, belatedly applied for his English patent on Jan. 30, 1844, Hancock entered his specification for an improvement in rubber manufacture at the British Patent office. Whereas Goodyear had included compounds of lead, which accelerated the change and enabled it to occur at lower temperatures, Hancock considered that only sulfur and a certain degree of heat were required for vulcanization.

Competing claims for the honour of originating the vulcanization process have been made by the supporters of Goodyear and Hancock. Claims have also been made on behalf of the German F. W. Lüdersdorff, the Swede Peter Jonas Bergius and the Dutchman Jan van Geuns. As far as Goodyear and Hancock are concerned, there can be no doubt that priority rests with Goodyear—though the contributions of both men were vital to the industry's development. From Goodyear came an inspired dedication to remove from rubber its fundamental weakness and to seek out new means of employing this material. From Hancock, a more practical man, came outstanding contributions in the mechanical manipulation of rubber.

5. Development of the Industry, 1850–1960.—Important branches of the industry had been established in Austria in 1821; France, 1828; Germany, 1829; and Russia, 1830; and in its expansion in Europe, U.S. assistance was considerable. The widespread adoption and improvement of vulcanization since 1850, coupled with the growing demand for mechanical rubber devices (created by the extension of steam and electrical power and the needs of the ever widening railway networks), resulted in the expansion of the rubber industry both in Europe and in North America. The increase of population and the rising standards of living created vast new markets for rubber footwear and clothing. The rediscovery of the pneumatic tire by John B. Dunlop (*q.v.*) in 1887, followed by the cycling craze of the 1890s, was felt on both sides of the Atlantic. Yet by the end of the 19th century, with the exception of the discovery of "cold vulcanization" in 1846 by the Englishman Alexander Parkes (1813–90) and the introduction by another Englishman, H. H. Waddington, of a dry heat process of vulcanization (1887), the industrial process remained much as it had been in the 1850s. The only major developments in the period 1850–1900 were the discovery of the acid and alkali processes of reclaiming rubber by the Americans H. L. Hall in 1856 and A. H. Marks in 1899. Progress, where it came, resulted from continuous improvements made by the practical man, rather than from new scientific methods. The stimulus given to the science

of rubber chemistry by German developments in the last quarter of the century did little to alter the empirical nature of the industry before the automobile age.

There are, in fact, no fundamental differences between the basic manufacturing processes of natural rubber used in 1900 and those of the 1960s. All the separate stages—preparing, cleansing, cutting, masticating, compounding, milling, vulcanizing, hardening, molding and finishing—are still essentially what they were in 1900, although the machinery has been continuously refined and improved. Even in the tire (*q.v.*) industry, apart from weftless cord, only one important innovation was made: the introduction in the 1920s of the flat-drum process of tire building. Of the other changes mention must be made of the introduction of several additional vulcanization and reclaiming processes, and of the growing direct use of latex, which opened up new industries in latex thread, foam rubber and many other products. Compounding formulas are much more complicated and varied than they were. One must also record the introduction in 1904 of the use of carbon black, the all-important reinforcing agent in modern rubber manufacture, and the discovery in 1905 by George Oenslager of the U.S. of organic accelerators, which speeded up the vulcanization process.

The greatest change in the industry in the 20th century has been the development of synthetic rubber, which in the mid-1960s was rapidly replacing the natural product.

6. Development of Natural Rubber Supply.—The traditional source of rubber, the wild trees of Central and South America, yielded a material that was of varying quality and uncertain supply. This fact ruled out the establishment of a futures market, making the rubber trade an attractive field for the speculator and a hazardous one for the manufacturer. So efforts were made to add to the supply of rubber by reclaiming scrap. While progress in this field was made on both sides of the Atlantic, it was the Americans who undertook its earliest production on a commercial scale and by the end of the 19th century U.S. consumption of reclaimed rubber equaled that of the natural product. The British sought to combat short supplies and fluctuating prices by increasing imports of wild rubber from Africa and by transplanting rubber seeds from the Amazon valley to British colonies in the east.

The Plantation Industry.—The origins of plantation rubber lie in the early 19th century—both Charles Goodyear and Thomas Hancock made reference to it—but the establishment of the industry in southeast Asia did not take place until the last quarter of the 19th century, when the growing demand had accentuated the need to widen the sources of supply; its founding was due to a group of British botanists. Among them were Sir Clements R. Markham, botanist and senior official of the India office; Sir Joseph Dalton Hooker, director of Kew gardens; and Henry N. Ridley, director of Singapore Botanical gardens from 1888 to 1911. Markham had already transplanted the quinine-yielding cinchona tree from South America to India and in 1870, working closely with Hooker, he turned to the cultivation of rubber. James Collins, formerly curator of the museum of the Pharmaceutical Society of Great Britain, was commissioned by the India office to make preliminary investigations. Collins recommended the establishment of plantations of the indigenous *Ficus elastica* tree in Assam and the introduction into India of the South American species. Effect was given to the former recommendation in 1873. Markham next turned to the problem of cultivating the *Hevea* and *Castilloa* plants. In 1875 and 1876 the botanist Robert Cross was sent to Central and South America to collect specimens and report on their requirements regarding climate and soil. The plants and seeds that he brought back with him, along with the very much larger number delivered later by Sir Henry Wickham (who has been undeservedly credited with starting the plantation industry), were soon distributed through the Botanical gardens at Kew to the tropical colonies of Ceylon, India and Malaya, and from there throughout the east.

Hevea brasiliensis proved to be much the most successful rubber plant, soon ousting other varieties. *Ficus elastica* grew well in Java and Burma but its great disadvantages were the long period that must elapse before tapping can begin and the irregular production. *Manihot* varieties, such as *M. glaziovii* (Ceara or Manicoba rubber), were cultivated in Malaya and Ceylon but later abandoned when it was proved that *Hevea* had a much higher yield; and *Castilloa elastica*, planted in India, Ceylon and Malaya, did not prove to have as regular a yield as *Hevea*.

The development of the plantation industry in southeast Asia, once the *Hevea* tree had been successfully transplanted, was rapid and considerable quantities of plantation rubber were on the market by 1910. Many factors facilitated this: labour was plentiful, soil and climate were favourable, and, in contrast with the supplies of wild rubber, plantation rubber was accessible and could be shipped easily to the industrial centres of Europe and North America. With the growth in world demand in the 20th century, the area of land planted to rubber trees in this region increased enormously. Whereas up to the end of 1910 world demand could be met by wild rubber, most of which was supplied by Brazil and other South and Central American countries, wild rubber supplies have since dwindled into insignificance—apart from the brief resurgence of American rubber in 1942–45 when southeast Asia was overrun by the Japanese. By the 1960s Brazil produced less than 2% of the world total.

Another important source of supply in the late 19th and early 20th century, the giant vines of the *Landolphia* and *Clitandra* species growing in widely separated areas of tropical Africa, gradually fell into disuse after 1914. Because of the critical shortages of World War II, interest shifted at that time to temperate-zone plants that contain latex. The most important proved to be the guayule (*q.v.*), a shrub native to north-central Mexico and southern Texas. The second most important source, as far as yield and low-cost production are concerned, is the wild dandelion plant Kok-saghyz. Discovered by the Russian L. E. Rodin in the Tien Shan mountains in Kazakhstan in 1931, it was first developed by the Russians in the 1930s, and production spread to the United States during the war years. Another rubber-yielding plant, which received considerable attention during World War II, is the "Mexican" rubber vine (*Cryptostegia*), a plant indigenous to Madagascar, which was cultivated in India and the middle east before being introduced into Mexico and other parts of the American continent. After 1945 developments in plantation and synthetic rubber completely overshadowed these attempts to find alternative supplies of rubber latex. By 1950 world output of natural rubber was about double the prewar figure, the vast majority of it coming from Malaya, Indonesia, Ceylon and Indochina. The growth of world demand after 1945 and the fact that natural rubber continued to be preferred for about 30% of the rubber industry's products enabled the plantation industry to withstand the competition of synthetic rubber. Because of the technical factors that determine the use of natural and synthetic rubbers, competition between the two varieties was confined to about 40% of total consumption. Producers of synthetic rubber have two advantages over producers of the natural product: prices are relatively stable and production can be increased fairly quickly.

7. Development of Synthetic Rubber.—The synthetic rubber industry developed rapidly from 1914 onward, owing partly to the search by many peoples for national self-sufficiency and partly to the growing world demand for rubber, but its origins can be traced back to the first half of the 19th century. A synthesis of rubber could not be provided until more was known about the natural product itself and in this connection the pioneering work of the English scientist Michael Faraday (1791–1867) is important. It was Faraday who, in 1826, made one of the earliest chemical analyses of natural rubber and gave it the formula $C_{10}H_{16}$, later superseded by $(C_5H_8)_n$. Since that time many analyses have been made in the search for a cheap and easily produced synthetic rubber. In 1838 the German F. C. Himly obtained a volatile distillate from natural rubber, and in 1860 the Englishman C. G. Williams broke down rubber by distillation into three parts: oil, tar and "spirit" (the more volatile fraction and the main constituent), which he named isoprene. Thereafter the task was to explore the chemical nature of isoprene and if possible to reconvert it to rubber. The Frenchman Georges Bouchardat took the first step in 1875, when with the aid of hydrogen chloride gas and

prolonged distillation he converted isoprene to a rubberlike substance.

In 1882 another Englishman, W. A. Tilden, produced isoprene by the destructive distillation of turpentine. He gave isoprene the formula $CH_2{=}C(CH_3){\cdot}CH{=}CH_2$ and also reported that specimens of isoprene (even those obtained from nonrubber sources), either spontaneously on storage or under the influence of chemical agents, changed into a product resembling rubber. This "polymerization"—the process of causing simple molecules to join together and form long chains—was eventually represented by the equation $nC_5H_8 \rightarrow (C_5H_8)_n$; the n indicates the number is unknown. With the growing knowledge of the molecular structure of rubber the way was opened to many other experiments. After 1910, as a result of the progress made in England by F. E. Matthews, metallic sodium became the general polymerizing agent in converting isoprene to rubber. C. D. Harries made the same discovery almost simultaneously in Germany. From Russia came several significant contributions. In 1901 I. Kondakov discovered that dimethyl butadiene when heated with potash produced a rubberlike substance. In 1910 S. V. Lebedev polymerized butadiene (*q.v.*) to produce an elastic material and also achieved a considerable measure of success in obtaining butadiene from ethyl alcohol. Another Russian scientist, I. Ostromislensky, in 1913 published a book on his researches describing a number of procedures for the preparation of isoprene, as well as providing rubber chemists everywhere with much valuable data on the sources of butadiene.

The greatest stimulus to these efforts came, however, with the blockade of Germany during World War I. Faced by the greatest need, the Germans succeeded in manufacturing a synthetic rubbery material. Because of the shortage of essential raw materials this was based not on the more satisfactory isoprene or butadiene but on Kondakov's process for dimethyl butadiene. Two chief kinds of synthetic rubber resulted: Methyl "H" for use in hard rubbers and methyl "W" for use in soft rubber goods. Only about 2,500 tons were produced and with the cessation of hostilities the Germans resumed using the less costly and more satisfactory natural product. Research and experiments continued, however, throughout the western world and in 1926 the German G. Ebert succeeded in producing a sodium-polymerized rubber from butadiene.

The U.S.S.R. began to produce synthetic rubber in the early 1930s employing B. V. Byzov's process (SKA) from petroleum and Lebedev's alcohol process (SKB) using potatoes and limestone as raw materials. In Germany developments in the 1930s lay in improving three "buna" rubbers (so called from the initial syllables of the two materials used to make it, butadiene and natrium [sodium]): Buna 85, 115 and 120, the numbers referring to the length of the carbon chain in the polymerized molecule. From another series of experiments came the discovery of buna-S, referred to by the British as SBR (styrene-butadiene rubber) and by the Americans as GR-S (government rubber-styrene). Vulcanized synthetic rubbers, first produced on a commercial scale from buna rubbers in the late 1930s, were superior in mechanical properties to the earlier synthetic rubbers and often to the vulcanized natural product. In 1937 buna-N (or nitrile), developed in Germany, was introduced into the United States and proved to be of remarkable value because of its oil-resistant qualities.

As World War II approached, both Germany and the U.S.S.R. made tremendous efforts to achieve self-sufficiency; by Aug. 1939 the first large synthetic rubber plant had been opened in Germany with an annual capacity of 25,000 tons, and the two countries together accounted for almost the entire world output of synthetic rubber. The only other country then in the field was the United States, where the quantities produced experimentally were negligible for military purposes. However, the spur of wartime needs quickly brought about a transformation, and the U.S. mastered what became the five chief types of synthetic rubber—buna-S, buna-N, butyl, neoprene and Thiokol. By 1945 a total of 820,000 tons was available.

U.S. experiments before 1939 resulted in the discovery of new types of synthetic rubbers, notably neoprene, Thiokol and butyl. The first of these, neoprene (first called Duprene), arose out of the work of Father J. A. Nieuwland, professor of chemistry at the University of Notre Dame; it was developed with the assistance of W. H. Carothers and Elmer K. Bolton of the E. I. du Pont de Nemours and Co. and was first manufactured and marketed by that company in 1931. The second, Thiokol, developed simultaneously by J. C. Patrick in the United States and J. Baer in Switzerland in 1926, is not sufficiently resilient to qualify as a true synthetic rubber but has proved useful because of its oil-resistant qualities. Butyl rubber was discovered in 1937 by two Americans, R. M. Thomas and W. J. Sparks, and was developed by the Standard Oil Company (New Jersey). This discovery and subsequent developments owed much to the stimulus provided by the Germans and to the existence of an arrangement for the exchange of scientific information between the I. G. Farbenindustrie A.G. and the Standard Oil company.

Although very large quantities of synthetic rubbers continued to be manufactured after World War II, none of the polymers possessed the precise molecular order of natural rubber. The lack of order in the molecular chain accounted for deficiencies in important properties, such as low resilience with corresponding increased heat buildup, compared with natural rubber. In 1953 two chemists, Karl Ziegler and Giulio Natta, discovered a family of stereospecific catalysts that were capable of introducing an exact and regular order to the structure of the polymers of various materials. The use of the Ziegler-type catalyst triethyl aluminium, combined with titanium tetrachloride, could be used to polymerize isoprene so that each molecule in the long-chain polymer was in a regular position and was virtually identical with the molecular structure of natural rubber. Commercial production of cis-1,4-polyisoprene was undertaken by firms in the U.S. and the Netherlands.

The same type of catalyst with butadiene as the monomer has been used to manufacture cis-1,4-polybutadiene rubber, which has been found to possess excellent abrasion resistance, especially in tires subjected to severe service conditions.

The introduction of catalysts that affect stereospecific polymerization opened up wide avenues for the development of new polymers such as ethylene-propylene rubber, which shows useful properties (*e.g.*, excellent weathering resistance). It is probably too early to assess the future of these new polymers, but they show promise of great potential. In 1956 H. J. Teas and R. S. Banduski announced the test tube synthesis of small amounts of natural rubber from acetate by the activity of enzymes that had been separated by centrifugation from freshly tapped *Hevea* latex. Whereas the synthesis of rubber began with the search for a substitute for caoutchouc, the development of the petrochemical industry after 1945 produced so many new "rubbery" materials that it became impossible to distinguish between synthetic rubber and plastics.

Because of British interest in natural rubber, research into synthetic rubber was not pursued during 1918–39 with the same intensity as in the U.S.S.R., Germany and the U.S. With the fall of Malaya (1942) British deficiencies in this field became apparent, and for the rest of World War II Britain was dependent upon the U.S. for supplies of synthetic rubber. In the period of 1945–50, in contrast to the course taken by the United States and the U.S.S.R., British manufacturers returned to an almost total dependence upon the natural product. After 1950, however, there developed in the United Kingdom a synthetic rubber industry whose output almost equaled the amount of natural rubber consumed by British industry.

For the chemistry of synthetic rubber and further details about world production see *Raw Materials, Synthetic Rubber,* below.

8. Production of Reclaimed Rubber and Rubber Latex.—The improvements in reclaimed rubber manufacture in the 20th century were so great that, in the 1960s, reclaimed rubber was no longer looked upon as a poor substitute for the natural product but was regarded as a compounding ingredient that is valuable because of its own physical and chemical properties.

Reclaimed rubber costs about 50% less than new rubber and is

widely used in footwear and other branches of the industry. Consumption varies from country to country and in the 1960s amounted to about 15%–20% of new rubber consumption.

More recent has been the expansion of the trade in latex, which is now used directly, making the earlier expensive methods of preparing rubber solutions unnecessary. It is employed in the production of cellular or sponge rubber, footwear, for impregnating and proofing textile materials, and for making dipped goods of all kinds. All this has become possible since P. Schidrowitz's discovery (1921) that latex can be vulcanized and since the development of satisfactory methods of preserving, concentrating and shipping natural latex to manufacturing countries. German experiments with the polymerization and copolymerization of monomers in aqueous emulsions, which began before World War I, led the way to the modern production of synthetic latices of buna-S, buna-N and neoprene.

Until World War II the chief suppliers of latex were Malaya (now Malaysia) and the Dutch East Indies (now Indonesia). During the war increased quantities were obtained from the U.S. plantations in Liberia, but in the 1960s Malaya recovered its position as the principal source. (*See* also *Raw Materials, Natural Rubber Latex,* below.)

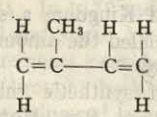
9. Distribution of the Industry.—In the 20th century the industry extended gradually from the older centres of manufacture in Europe and the United States to newer and less industrialized parts of the world. Increasingly, after the early 1930s, the British and especially the Americans established branch factories in many parts of the non-Communist world, including Japan, Australia, Argentina, Brazil and the Republic of South Africa. By doing so they were able to manufacture more economically for their foreign markets, to combat rising tariffs and, to a certain extent, to assuage the political and national susceptibilities of other nations.

II. RAW MATERIALS OF THE INDUSTRY

A. Natural Rubber

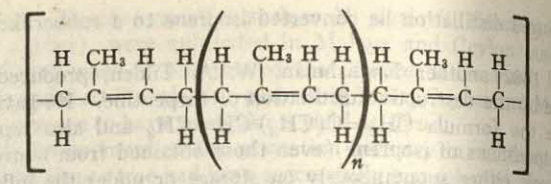
1. Physical and Chemical Properties.—The uniqueness of rubber lies in its physical properties of extensibility and toughness. In its natural state, it is greatly affected by temperature, becoming harder when cooled (at 0°–10° C. it is opaque) and softer when heated (above 50° C. it becomes tackier and less elastic, decomposing into liquid form at 190°–200° C.). When vulcanized (*i.e.*, heated with sulfur at 120°–160° C.) it loses its thermoplasticity and becomes stronger and more elastic. The range of its plasticity, depending on the degree of vulcanization, can vary from extreme softness to the hardness of ebonite (hard rubber). Soft vulcanized rubber can be stretched repeatedly from 7–10 times its original length and immediately regain its approximate original dimensions. Natural rubber exhibits a tensile strength of 275–350 kg. per square centimetre and a modulus of elasticity of 11–24 kg. per square centimetre at 300% elongation (when compounded with 25% carbon black the modulus can increase to 50–90 kg. per square centimetre). Rubber is impermeable to water and to a large degree to gases. Because of its electrical resistivity soft rubber is used as an insulant and ebonite is employed as a high-grade dielectric.

Chemically, rubber is a polymer of isoprene (C_5H_8). Thousands (perhaps 40,000–50,000) of isoprene molecules are linked together by primary valence bonds



Isoprene
(2-methyl-1, 3-butadiene)

into chains of enormous length. Because of the enormous size of its molecule, rubber has a molecular weight of about 300,000. The structure of rubber may be represented by the following diagram, which indicates the middle isoprene unit is repeated for an unknown number of times; the exact nature of the end groups also is not known:



Isoprene belongs to the class of organic compounds called terpenes (*q.v.*) and is related to turpentine in its chemical composition. Rubber is soluble in a number of solvents such as benzene, chloroform, carbon tetrachloride or ether, and, when treated with these solvents, can be changed into a viscous mass. In this plastic state it is workable and can be molded and compressed under pressure into any shape, which it will later retain permanently. A comparative table of the physical and chemical properties of natural and the most commonly used synthetic rubbers is given in *Manufacturing Processes,* below.

2. Botany.—Rubber, or caoutchouc (literally, "weeping wood"), is produced by a wide variety of plants. Commercially it has nearly always been obtained from the white, milky liquid known as latex (not to be confused with sap) that is found in small tubes or veins of the inner bark of rubber-yielding trees of the tropical and semitropical regions. The function of the latex juice in the life of the tree is not clear. It is easily obtained by cutting, or "tapping," the bark of the tree and catching the latex so released.

The chief source of crude rubber has been the *Hevea brasiliensis* (family Euphorbiaceae), a tall tree of soft wood with high branching limbs and a large area of bark. In its wild state it has been known to grow more than 125 ft. in height with a trunk girth of more than 18 ft. On the eastern plantations the average tree is usually 60–80 ft. high. The leaves are pointed trifoliate, smooth and dark green, about 8 in. in length. They are shed once a year while new leaves are forming. The small yellowish-green blossoms grow in clusters, each tree bearing both male and female flowers. The fruit capsules contain three speckled brown seeds, about an inch in length, which are exploded out of the seed pods when ripe. The structure of the bark is as follows: on the outside is a layer of cork, next to which lies a stone cell layer and then the soft latex-bearing cortex containing the latex tubes. Between the cortex and the heartwood lies the cambium, a paper-thin layer of tissues that propagates the growth of the bark cells on one side and of the heartwood on the other. When the tree is tapped the latex flows from the portion of the tree below the cut, not above it.

Another Brazilian tree, which spread throughout the tropics but was soon ousted by the *Hevea,* was the ceara, or manicoba, one of the well-known *Manihot* varieties. Earlier known and the most productive wild tree in Central America was the *Castilloa elastica* (family Moraceae). In the east, both the *Ficus elastica* tree (also of the Moraceae family and one of many rubber-producing *Ficus* species distributed throughout southeast Asia and the Pacific Islands) and the *Urceola elastica* (family Apocynaceae), a vinelike plant of the East Indies, yielded considerable quantities of wild rubber. The sources of African wild rubber were various. *Funtumia elastica* trees (family Apocynaceae) are widely distributed in tropical regions. Unlike the American and Asiatic supplies, however, most African rubber was produced by the giant vines of the *Landolphia* and *Clitandra* species (family Apocynaceae). The plants gutta-percha (family Sapotaceae) and balata (of the genus *Mimusops*) also provide a rubberlike material. Gutta-percha is obtained from a species of trees mainly indigenous to Malaya. Introduced to Europe in the middle of the 17th century, it came to be used in many ways, including the insulation of underwater cables. Trees that yield balata latex are native to the northwestern parts of South America. After World War II gutta-percha and balata were replaced by synthetic plastics based on polyethylene. (*See* also Gutta-Percha.)

Many other plants contain rubber latex. The two best-known are members of the Compositae—guayule (*Parthenium argentatum*), a low-growing shrub of many varieties indigenous to America, and the Russian dandelion *Taraxacum kok-saghyz.* Unlike the trees and vines mentioned above, the rubber in the guayule

plant is contained in the bark, roots, leaves and stems; the latex of the Russian dandelion is contained largely in the roots. The guayule bush, in its wild state, usually requires four to five years before it can be harvested; Kok-saghyz appears to be a perennial plant but under cultivation it is treated as an annual or biennial. Besides the Kok-saghyz two other wild dandelion plants have come to be regarded as secondary rubber-yielding plants: *Scorzonera tau-saghyz* and *krym-saghyz*. Other plants introduced into the U.S. are *Cryptostegia grandiflora* and *C. madagascarensis* (hybrid: *C. florida*). These are shrublike vines whose rubber is uniformly high in quality; they give their maximum yield within a year of seeding and flourish in a wide variety of soils and climates. Like that of the guayule bush the rubber of *Cryptostegia* is contained in the leaves, bark, seed pods and stems. (*See* also DANDELION; EUPHORBIACEAE; FIG; GUAYULE.)

3. Wild Rubber.—*Tapping.*—The methods employed in harvesting wild rubber have been, and still are, numerous and usually primitive. The aim has been to obtain the maximum amount of latex and this has been done either by stripping the bark and tapping the laticiferous system or, on occasions, by felling and draining the tree.

Coagulation.—The processes used are varied and largely primitive. Most wild rubber is coagulated by revolving a latex-covered stick above a smoke fire until several layers of dried latex form themselves into a "ball," or "biscuit," of hard rubber. By this means the rubber is freed of the water and proteid matter that encourage putrefaction and reduce elasticity. The latex of some trees, such as the *Castilloa,* does not respond readily to smoking and has to be coagulated by mixing with the juice of certain vines.

Marketing.—Wild rubber has usually reached the market in the same condition as prepared by the native. The weight of the consignments, described as "balls," "knuckles," "lumps," "flakes," "tongues," etc., varied from 80 to 300 lb.

4. Plantation Rubber.—*Climate and Soil.*—The *Hevea brasiliensis* plantations of southeast Asia are mainly in the tropical and subtropical regions of Malaya, Indonesia, Ceylon, India, Burma, Thailand, Indo-China and Borneo, the first two being the most important. These regions provide the necessary conditions of rainfall, humidity, equable temperature and altitude. An example of favourable climatic conditions is Malaya, where the maximum day temperature in planting districts is 85°–87° F., the night temperatures about 10° lower, the annual rainfall 80–120 in., and the humidity 80%–90%, accompanied by heavy night dews.

Although certain species of rubber trees can be grown at higher elevations, 1,500 ft. is thought to be the highest altitude for *Hevea* plantings. A well-drained, light to medium sandy loam is most suitable. Considerable variations exist: in Java most soils used for rubber planting are of volcanic origin; in Sumatra and in Malaya rubber grows on either light, sandy or heavier alluvial soils. Land planted to rubber trees has usually had to be cleared of virgin jungle and the extent to which the ground is cleared and kept clear can only be determined by local conditions. Much depends on whether the weeds surrounding the trees have a deep root system, which might interfere with rubber growing. A protective covering of indigenous plants (except for the harmful lalang grass) is desirable to avoid soil erosion, to provide humus and to help combat the attacks of insects and microorganisms. In young plantations the protective interplanting of cover crops such as coffee and cacao is sometimes practised.

Planting Methods.—Seeds are selected from clones that have shown high yields, good bark characteristics and resistance to disease. The seedlings, which have been raised in a nursery, are planted in even rows. Density varies from 100 to 300 trees per acre and the trees are gradually thinned out over seven or eight years. Generally speaking, the more widely spaced trees are sturdier and have a larger girth and thicker bark. Another method of propagation is bud grafting; in this method, a dormant bud selected from a high-yielding tree is grafted onto the seedling, usually after the first or second year of growth. Depending upon the climatic conditions, grafting is carried out either in the nursery or in the plantation. After ten days the seedling is pruned just above the grafted bud, which later grows to form the new tree. The advantage of bud grafting, as of artificial pollination, is that it is more likely to reproduce high-quality yielding trees. Careful seed selection and bud grafting have raised the average annual yield from the 1920 level of about 300 lb. of dry sheet rubber per acre to over 1,000 lb. per acre and, in some individual cases, to even higher yields. However, these high yields apply only to the most carefully managed and scientifically directed estate plantations. Extensive propagation techniques still have to be applied to most plantations and to small native holdings.

Diseases.—Despite the hardiness of the *Hevea* tree it is not free from attack by diseases and insect pests. Damage can be done by termites, caterpillars and scale insects. Various types of fungus and mildew also affect roots, branches and leaves. Of the root and branch diseases *Ustulina zonata* is the most common. The leaf-fall disease, of greatest significance in the eastern plantations, is due to *Oidium,* a parasitic mildew. This parasite attacks young leaves and buds after refoliation. Unscientific tapping can cause various rots and diseases of the tapping panel, thus preventing the healthy growth of the renewing bark and, in the case of the brown bast disease, causing the bark to crack and the latex to coagulate and stop flowing altogether.

Tapping.—The tapping is generally begun 3–4 ft. from the ground. A thin shaving of bark is removed with a diagonal cut extending a third or half the distance around the tree at an angle of 30°. Some estates employ a V-shaped cut. Depending upon the thickness of the shaving and the frequency of tapping, the incisions continue to be made until they reach the ground or another tapping panel is begun on another part of the tree. If the tree is not injured in tapping, the renewed bark and latex vessels, which take several years to recover, may be tapped again. As latex flows more freely around dawn, tapping is begun at sunrise. Tapping methods and systems vary from year to year and from estate to estate. The best system can only be decided upon after several years of experiment and observation, and different techniques are necessary with the different species. The *Castilloa elastica,* for instance, gives its best yield with two to six tappings per year, whereas the *Hevea* responds best to tappings every day or every alternate day. To avoid exhausting the tree, and to encourage growth and yield, some estates rest the trees over a period of several months.

On *Hevea* plantations it is usual to begin tapping when the tree has reached five or six years of age. Normally output continues to increase (although there is an astonishing inconsistency of yield) for 10 to 15 years and, with care, the economical life of a plantation tree may extend over 25 to 30 years.

Collection of Latex.—The latex runs into cups attached to the trees. It is then emptied into pails and taken to the nearest collecting station, where it is weighed for payment. From there it goes in larger tanks to the nearest rubber factory and is prepared for shipment abroad. As the quality of the rubber is materially affected by the standard of cleanliness in handling the latex, on the large estates every precaution is taken to ensure that the latex reaches the rubber factory uncontaminated. However, standards of cleanliness vary. In the case of guayule shrubs rubber is obtained by chopping and grinding the entire plant. The latex of Kok-saghyz is extracted from the roots.

Coagulation and Preparation for Market.—The latex juice as it comes from the tree consists largely of water with small quantities of sugars, inorganic salts and proteins in solution. Moving hither and thither in this liquid (Brownian movement) are the

BY COURTESY OF B. F. GOODRICH CO.

SLABS OF RUBBER RISING TO THE SURFACE OF A COAGULATING TANK

globules of rubber, about $\frac{1}{16,000}$ in. in diameter, that account for 30%–40% by weight of the latex juice. When acids or certain salts are added to the latex the particles of rubber unite to form a clot of solid rubber, a process known as coagulation.

On modern eastern plantations the latex is first strained to remove dirt and foreign matter. It is then poured into tanks where it is diluted with an approximately equal amount of water, and a solution of acetic or formic acid or sodium silicofluoride is added to cause coagulation. This must be done within 24 hr. after collection, otherwise the latex will turn sour and decompose. The tanks are equipped with a series of aluminum partitions that can be lowered into the liquid so that, as the rubber rises to the surface, it is held between them and coagulates in the form of slabs. These slabs of soft doughy mass (coagulum) are then washed and pressed between several pairs of metal cylinders, by which means most of the liquid and impurities are removed. When "smoked sheet" is made the last pair of rollers is ribbed and sheets emerge about 0.125 in. thick. They are cut into convenient lengths and hung in a smokehouse for about a week. "Smoked sheet" makes up most of the produce of the average estate. "Pale crepe" is obtained by passing the slabs of coagulum between heavy corrugated iron rollers revolving at irregular speeds. They are further processed and air-dried in large sheds or drying rooms. A small quantity of sodium bisulfite mixed with acetic acid produces the pale yellow colour. The care taken with these processes determines the grade the rubber will obtain in the market.

Much rubber is still coagulated and processed by primitive methods. The native with a few trees, who cannot get his produce to a central rubber station, coagulates his latex by pouring it into pans and permitting the moisture to evaporate gradually. Sometimes sulfuric acid or alum, which later adversely affect the manufacturing process, are used. Most of this produce is milled to crepe in one of the plantation factories and sold as an inferior grade. After being graded and packed, the slabs are shipped to their destination, usually in squat 200-lb. bales.

Natural Rubber Latex.—After about 1920 a considerable trade in *Hevea* latex grew up as improved methods of concentrating, preserving and transporting the latex were developed. The major problem was to secure a steady supply of the uncoagulated liquid. Ammonia was adopted as the standard preservative and later formaldehyde and potassium hydroxide were used for special purposes. From 1934 onward the latex was transported in special ships in bulk, instead of in steel drums as formerly. Gradually, through a system of centrifugation and creaming (patented in 1923 by W. L. Utermark) and the later electrodecantation process, it became possible to obtain concentrated latices with dry rubber content of 60%, or even higher; an evaporation process developed in the east yielded a concentration of 75%. By the 1930s the bulk of the world's dipped goods were made with latex rather than the older-style rubber solutions. Table I shows world consumption of natural latex in representative years beginning with 1951.

TABLE I.—*Consumption of Natural Rubber Latex*
(in long tons—dry solid weight)

Year	U.S.	U.K.	France	Federal Republic of Germany	Canada	World Total*
1951 . . .	46,750	16,445	3,833	1,489	2,185	83,500
1955 . . .	86,478	31,600	8,139	12,437	3,756	166,750
1957 . . .	75,009	27,000	10,474	12,000	3,037	164,000
1959 . . .	71,745	30,500	13,047	13,850	3,337	183,000
1961 . . .	43,795	24,300	12,748	13,500	1,487	158,750
1962 . . .	41,936	23,000	12,859	16,600	1,306	166,000

*Including estimates for Communist countries.
Note: The world totals include estimated consumption of countries other than those mentioned.

Marketing.—Few commodities have experienced greater fluctuations in price levels than rubber. In the 19th century, when the supply was principally wild rubber, prices fluctuated between 50 cents and $1 a pound. From a high in 1910 of $2.88 a pound for plantation rubber, the price fell in 1915 to a low of 58½ cents a pound. By the early 1920s the price was lower still and in 1922 the British government's Stevenson restriction plan came into force to control average prices. The refusal of the Dutch producers to enter into the plan, along with other causes, led to its abandonment in 1928. Price fluctuations continued and in June 1932 the monthly average spot price of plantation ribbed smoked sheets on the New York market was at a record low level of less than three cents a pound. With the introduction of the International Rubber Regulation agreement in June 1934 the British and the Dutch governments tried to control supplies. Until the agreement was discontinued in 1943 prices varied from 9 cents to 25 cents per pound. From 1942 to 1947 the price of plantation rubber was controlled by the British and U.S. governments. There was a subsequent upsurge in 1950 when the price rose to 64½ cents a pound. In the mid-1960s it was approximately 31 cents, prices having dropped because of a rapid increase in the consumption of synthetics and also because of changes in demand conditions. The development of synthetic rubber tended to stabilize prices.

The most striking change in the distribution of plantation supplies has been the extent to which Britain lost its 19th-century lead as the chief distributor of all types of rubber. Another important change has been the extent to which the chief fault of wild rubber, its variability, has given way to the more uniform standards of plantation produce.

Geographical Distribution of Plantation Industry.—The total area of plantations in the east amounted in 1900 to 5,000 ac.; in 1910 to 1,000,000; and in 1920 to 4,000,000. After the end of World War II the total area exceeded 9,000,000 ac. (including small native holdings as well as large plantations) and in the mid-1960s it was in the region of 11,500,000 ac. In the 1960s, even allowing for the African plantations and the cultivation of Kok-saghyz in the U.S.S.R., all but 2% or 3% of the world's supply of natural rubber still came from the *Hevea* trees in the eastern plantations.

Most of the plantation acreage in the mid-1960s was in Malaya and Indonesia, each country accounting for about 3,400,000 ac. Slightly more than half of the acres in Malaya were in estates, whereas in Indonesia about three-fourths of the acreage was in small holdings. The third largest number of plantation acres was the 715,000 in Africa. Smaller acreages were in Ceylon, Indochina, India, Sarawak and Latin America.

B. SYNTHETIC RUBBER

The term synthetic rubber is used to describe an ever growing number of elastic materials, some of which closely resemble natural rubber while others have completely different physical properties. Since World War II, precise terminology has not kept pace with the rapid developments in the synthetic and plastics industries. Hence, the following description of the production of certain synthetic rubbers can serve only as an introduction to the developments whose scope now extends far beyond the early ef-

forts of rubber chemists to reproduce the properties of natural rubber.

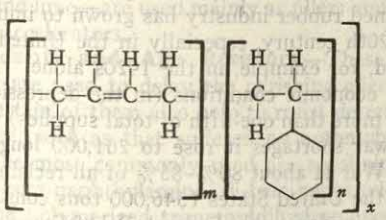
Synthetic rubber is produced by chemically rearranging the molecular structures of certain unsaturated hydrocarbons and their derivatives. By polymerization, great numbers of hydrocarbon molecules are made to link up in long chains, the repeating units being known as monomers and the resulting macromolecule as a polymer. The size and structure of the macromolecule confers on rubber its resilience and extensibility. (*See* also NATURAL PRODUCTS, TOTAL SYNTHESIS OF.)

The production of synthetic rubber proceeds in two stages, the first being the preparation of the monomers, the second the polymerization process. Petroleum has so far been the most suitable and most important raw material, but other substances, such as potatoes and grains (which produce alcohol), coke, limestone, salt and sulfur all play an important part.

1. SBR (GR-S, or Buna-S).—This synthetic rubber is a copolymer of butadiene ($CH_2{=}CH{-}CH{=}CH_2$) and styrene ($C_6H_5{-}CH{=}CH_2$). Butadiene can be produced from petroleum or alcohol by several methods: (a) the pyrolysis or "cracking" of petroleum; (b) the treatment of butane found in natural gas and petroleum; (c) the passing of alcohol over a heated mixture of oxides of aluminum and zinc; (d) the fermentation of carbohydrates to produce butylene glycol.

Styrene is usually prepared by the distillation of a mixture of benzene (extracted from coal tar) and ethylene (produced either from alcohol or petroleum) in the presence of catalyst, usually aluminum chloride.

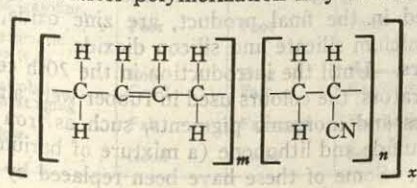
The copolymerization of the butadiene and the styrene takes place in an emulsion in the presence of an active initiator, such as cumene hydroperoxide and *p*-menthane hydroperoxide, which allows the conversion to occur at a low temperature (5° C.). SBR is usually prepared with 75% butadiene and 25% styrene; the proportion will, however, vary according to the desired degree of elasticity. Its molecular structure after polymerization may be represented as:



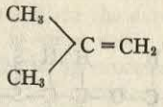
SBR type rubber can then be subjected to the same manufacturing processes as natural rubber. Its essential differences from natural rubber are its poorer resilience, lack of building tack and greater heat build-up, making it unsuitable for use in heavy-duty truck tires; its advantages are better resistance to oxygen and weathering and greater uniformity of curing rate and plasticity.

2. Nitrile (Buna-N).—This second synthetic rubber is a copolymer of butadiene and acrylonitrile, $CH_2{=}CHCN$. The butadiene is produced by the same methods as for buna-S. Acrylonitrile can be obtained (1) through a reaction process of ethylene chlorohydrin and sodium cyanide that gives hydracrylic nitrile, from which acrylonitrile is obtained through a dehydration process; (2) by the addition of hydrocyanic acid to acetylene in presence of a catalyst.

The polymerization process takes place in the presence of an emulsifier and a catalyst at a temperature of about 13° C. Varying combinations of butadiene and acrylonitrile produce different rubbers that are valued chiefly for their resistance to petroleum, aromatic oils, abrasion and high temperatures. The molecular structure of nitrile after polymerization may be shown as:

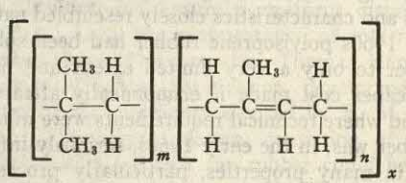


3. Butyl.—Butyl is a copolymer of isobutylene (also known as isobutene),



and 2%–3% of isoprene or small amounts of other unsaturated hydrocarbons. Isobutylene and isoprene are obtained from cracked refinery gas. The four-carbon fraction usually contains 10%–35% isobutylene, which is extracted by absorption in sulfuric acid, neutralized and distilled to yield pure isobutylene. Isoprene is obtained from the five-carbon fraction through an extractive distillation process.

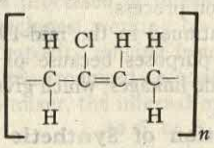
The polymerization of butyl rubber is a low-temperature ionic process, initiated at temperatures of about −94° C. (−140° F.) in the presence of an initiator of the Friedel-Crafts type (*see* also FRIEDEL-CRAFTS REACTION). Boron fluoride is passed through the isobutylene to ensure induction, while pentane or ethylene are added to absorb the heat of reaction. The molecular structure of the polymer is as follows:



The major advantages of butyl over natural rubber are its greater resistance to oxidative aging, ozone and acids.

4. Neoprene.—Neoprene is a polymer of chloroprene (2-chloro-1,3-butadiene), C_4H_5Cl, which is produced by a process that uses acetylene as the starting material. In synthetic rubber factories acetylene is usually made by cracking hydrocarbons from petroleum or natural gas with a high-temperature electric arc. The acetylene yields vinylacetylene through catalytic diminution, and hydrochloric acid is then combined with the vinylacetylene in the presence of a catalyst to produce chloroprene.

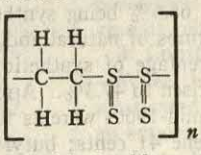
Chloroprene will polymerize spontaneously to form a rubbery substance. Commercially the polymerization process is achieved in an emulsion, sulfur being used as a modifier. The latex is allowed to age in a solution of tetramethylthiuram disulfide, which restores the plasticity of the polymer, or it can be milled dry. Its molecular structure can be represented as follows:



Neoprene rubbers show high tensile strength in the absence of carbon black and resist oxidative degeneration, weathering and ozone and are only slightly inferior to nitrile in oil resistance.

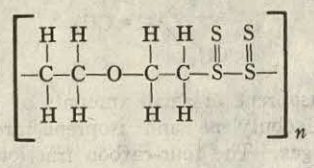
5. Thiokols.—The Thiokols, or polysulfide rubbers, are compounds of an ethylene dihalide and an alkali polysulfide. Thiokol A is a compound of ethylene dichloride and sodium polysulfide. Ethylene dichloride, $CH_2Cl{-}CH_2Cl$, is a direct compound of ethylene and chlorine. Sodium polysulfide (Na_2S_n, where $n = 2$ to 5) can be prepared by dissolving sulfur in a solution of sodium sulfide or by heating it with aqueous caustic soda.

The polymerization process is carried out at a temperature of approximately 70° C. The ethylene dichloride is added to an aqueous solution of sulfur in sodium hydroxide. Only two or three hours are necessary for the formation of the synthetic latex, which can be represented as follows:



There are a number of Thiokol rubbers, their qualities varying according to the ingredients used. Thiokol B is obtained from

dichloroethyl ether and a sodium polysulfide; its structure may be represented thus:



The advantages of Thiokol rubbers are their oil and solvent resistance and their impermeability to gases.

6. Stereospecific Rubbers.—Although polybutadiene and polyisoprene had been manufactured by emulsion polymerization processes similar to that used for SBR, the resultant polymers were of poor quality because of the lack of regularity in the configuration of the molecular chain.

The discovery of stereospecific catalysts by Karl Ziegler led to the announcement in Dec. 1954 by the B. F. Goodrich Co. of the synthesis of natural rubber. This cis-1,4-polyisoprene possessed a very high degree of regularity in long-chain molecules; its properties and characteristics closely resembled natural rubber. By the early 1960s polyisoprene rubber had been substituted for natural rubber to only a very limited extent and only in fields where its cheaper cost made it economically attractive, *e.g.*, in shoe soles, and where technical requirements were minimal. Polyisoprene rubber was, in the early 1960s, seriously inferior to natural rubber in many properties, particularly processability and versatility. In April 1956 Phillips Petroleum revealed that it had produced cis-1,4-polybutadiene, which has proved to have excellent wearing qualities and much better low-temperature performance than natural rubber.

These newer stereospecific polymers were produced in a solution process. The monomers are dissolved in a solvent and the catalyst is added, the ingredients being carefully dried to remove any water. The polymer produced in this solution process dissolves in the solvent as it is formed and when the polymerization has proceeded to the desired degree the reaction is terminated by destroying the catalyst. The spent catalyst is then removed, and the solvent and rubber are recovered.

All stereoregular rubbers are produced through polymerization in the presence of an ionic type catalyst (metallic lithium or a Ziegler-type initiator). The Firestone process calls for 0.1 part of lithium per 100 parts of isoprene, which are heated at 30°–40° C. in the polymerization process.

Natural rubber continued in the mid-1960s to be superior to synthetics for many purposes because of its oxygen-containing substances and peroxide linkages, which give natural rubber better milling characteristics.

7. World Production of Synthetic Rubber.—The world output of synthetic rubber in 1935 was estimated at 10,000 tons; by 1939 it had increased to 72,000 tons, of which Germany and the U.S.S.R. together produced all but a small fraction that was made in the U.S. on an experimental scale. (World production of synthetic rubber in 1962 was estimated at 2,242,500 tons, compared with 2,105,000 tons of natural rubber.) A Russian report states that in 1938 the U.S.S.R. produced 53,000 tons; by 1943 Germany had an annual production of about 116,000 tons. The output of synthetic rubber in the U.S. was enlarged from approximately 8,000 long tons in 1941 to 235,000 by 1943 and 820,000 in 1945. In 1939 the U.S. consumed 54% of world rubber supplies, but only 0.3% of this was synthetic. In 1950 the U.S. proportion of world consumption of crude rubber was still more than half (55%), but 43% of American needs were met by the synthetic rubber industry. By 1960 the U.S. proportion of total world consumption was 41.3%, 68.6% being synthetic. A comparison of world consumption figures of natural and synthetic rubber shows that in 1940 the percentage of synthetic rubber was about 4% but by 1960 this had risen to 47.3%. Approximate prices of synthetic supplies in the mid-1960s were as follows: nitrile 49 cents; SBR 23 cents; neoprene 41 cents; butyl 23 cents; and Thiokol 50 cents per pound. Table II gives information on the production of synthetic rubber since the end of World War II. The material was obtainable after the war only from the United States, the U.S.S.R., Canada and the Federal Republic of Germany, and the problem of dollar exchange made its purchase from North America problematic for many European countries. In the immediate postwar years there was a natural tendency in the case of Britain, France and the Netherlands to concentrate on the natural produce of their overseas territories. However, the importance of the new U.K. synthetic rubber producing industry (56,990 tons in 1959; 90,015 tons in 1960) should not be overlooked.

TABLE II.—*Production of Synthetic Rubber in Selected Countries*
(in long tons)

Year	United States SBR	United States Neoprene	United States Butyl	United States Nitrile	Canada Total	Federal Republic of Germany Total	Total
1945 . . .	719,404	45,651	47,426	7,871	45,717	——	866,069*
1950 . . .	358,248	50,067	55,832	12,037	58,440	——	534,624*
1955 . . .	791,197†	91,357	55,291	32,623	103,896	10,902	1,085,266
1957 . . .	907,531	110,721	66,936	32,982	132,141	11,602	1,262,666
1959 . . .	1,130,660	124,815	81,008	43,169	100,682	48,126	1,640,000
1960 . . .	1,166,151	134,442	97,950	37,899	159,673	79,792	1,887,500

*Excluding German production. †Previous to 1955, excluding oil content.

Table II shows that synthetic rubber was playing an increasingly important part in world supplies by the 1960s. In the United States the government-owned synthetic plants, built to meet war needs, were transferred to private control on May 1, 1955.

C. Reclaimed, or Scrap, Rubber

Scrap, such as is obtained from used tires and tubes, can be prepared for reuse in manufacture by a number of processes. It is first chopped and ground and then subjected either to the heater process or (especially if the scrap contains fabric) the alkali process. This reduces the reclaim to a clean, softened mixture, which after washing and drying is ready for reprocessing by the customary means (see *Manufacturing Processes*, below).

The reclaimed rubber industry has grown to important proportions in the 20th century, especially in the United States, where output tripled, for example, in the 1920s alone. The trade rose and fell with economic conditions (in the depression of 1933 reclaim was no more than one-fifth of total supplies) until under the stimulus of war shortages it rose to 261,000 long tons in 1944. After World War II about 80%–85% of all reclaimed rubber was recovered in the United States (346,000 tons consumed in 1951). The United Kingdom, the Federal Republic of Germany, the U.S.S.R., France and Japan also became leading producers: the U.K. accounted for 7%–8%; the Federal Republic of Germany increased production from 15,339 long tons in 1950 to 45,944 in 1960; France similarly increased production from 14,410 long tons in 1950 to 29,546 in 1960; and Japan's reclaiming capacity was put at about 40,000 long tons in the mid-1960s.

D. Materials Other Than Rubber

1. Reinforcing and Filling Materials.—These materials are used in rubber manufacture to strengthen or cheapen, or to produce a specific physical effect, in the finished product; for example, to increase hardness, to build up resistance to abrasion, chemicals and heat, to improve electrical properties or to change specific gravity. The most common fillers (*i.e.*, cheaper materials used to bulk out the rubber) include barites (a mineral containing barium sulfate), asbestos powder, hard clays, Factice (a rubbery substance made by the action of sulfur on various vegetable oils), talc (hydrated silicate of magnesium) and limestone. Carbon black is used in the compounding of both natural and synthetic rubbers. Other common reinforcing agents, which are used according to the properties desired in the final product, are zinc oxide, magnesium carbonate, calcium silicate and silicon dioxide.

2. Colours.—Until the introduction in the 20th century of organic accelerators, the colours used in rubber were almost entirely earth colours and inorganic pigments, such as iron oxides, zinc oxide, zinc sulfide and lithopone (a mixture of barium sulfate and zinc sulfide). Some of these have been replaced by more varied

and stronger organic dyestuffs (phthalocyanine colours) and the pure iron oxides. Most significant was the introduction in the 1930s of titanium dioxide, which is now regarded as the best white pigment. Many considerations influence the choice of colours, including the possible interactions between the colours employed and the other raw materials used in rubber manufacture.

3. Plasticizers and Softeners.—Since the earliest days of the industry all kinds of vegetable and mineral oils, oxidized petroleum residues (mineral rubber), fatty acids or their zinc salts, waxes, tars, pitches and resins have been used to facilitate and improve the mixing and processing of rubber compounds. For softening synthetic rubbers, resins derived from coal by distillation have been most successful.

4. Curing or Vulcanizing Agents.—These are compounding ingredients that induce vulcanization. The most common was, and still is, sulfur, used in the form of ground brimstone. Tetramethylthiuram disulfide, selenium and tellurium are also used, usually with some sulfur. Vulcanization can also result from the employment of benzoyl peroxide, aromatic (*i.e.*, ring) compounds containing either two or three nitrogen atoms, dioximes, diisocyanates and dinitroso compounds.

5. Accelerators of Vulcanization.—These substances not only accelerate the vulcanization process but also enable it to be carried out at a much lower temperature; in addition, they improve the quality of the manufactured product. Since George Oenslager's discovery in 1905 of the accelerating value of certain organic substances, many new accelerators have appeared; they include the thiurams, dithiocarbamates, zinc alkylxanthates, nitrosodimethylaniline, diphenylguanidine and mercaptobenzothiazole. The latter is the principal accelerator used in tire and other high-grade manufacture. Accelerators usually achieve economies in time, heat and sulfur. A combination of stearic acid and zinc oxide is among the so-called "activators" often used with organic accelerators to increase their efficiency.

The traditional inorganic accelerators—litharge (lead monoxide), red and white lead, zinc oxide (the most widely used), magnesium oxide and lime—are used mainly as fillers and as activators of the organic accelerators.

6. Antioxidants and Age Resistors.—These are organic chemicals that are used to delay the perishing effect oxygen has on rubber. Certain of them also help to resist deterioration from repeated flexure, such as that suffered by automobile tires, and from heat. The most commonly used are aldol-alpha-naphthylamine, phenyl-beta-naphthylamine, di-beta-naphthyl-para-phenylenediamine, and polymerized trimethyldihydroquinoline.

7. Fabrics.—Besides rubber and chemicals, cotton, rayon and nylon are consumed by the industry in the manufacture of tires, footwear, mechanical devices of all kinds and waterproof garments.

TABLE III.—*Features and Properties of the Most Commonly Used Polymers*

Common name	Natural rubber	SBR	Butyl	Polybutadiene	Neoprene	Nitrile	Polyisoprene
Main features	High pure gum strength. Good general mechanical properties.	Resistant to moderate heat, aging and abrasion. Fairly good mechanical properties.	Outstanding air retention, good damping. Resists elevated temperature, ozone and weathering.	High resilience and abrasion resistance. Resistant to moderate heat, aging. Good low temperature properties.	Resistant to weather, ozone and elevated temperature. Moderate oil resistance. Flame resistant.	Good resistance to gasoline and oils. Good abrasion resistance.	High pure gum strength. Can be used as a direct replacement for natural rubber.
Tensile strength	Excellent	Good-excellent	Fair	Fair	Good	Good	Excellent
Elongation	Excellent	Good	Good	Fair-good	Good	Good	Excellent
Resilience	Excellent	Good	Poor	Excellent	Fair	Fair	Excellent
Hardness range (durometer)	30–100	40–100	30–100	45–80	40–95	20–90	30–90
Electrical resistivity	Excellent	Good	Excellent	Good	Fair	Poor	Excellent
Gas impermeability	Good	Good	Outstanding	Good	Good	Good	Good
Abrasion resistance	Good	Good-excellent	Fair	Outstanding	Good	Excellent	Good
Resistance to aliphatic hydrocarbons (gasoline, oils)	Poor	Poor	Poor	Poor	Fair	Good	Poor
Resistance to aromatic hydrocarbons (*e.g.*, benzene)	Poor	Poor	Poor	Poor	Poor	Fair	Poor
Resistance to alcohol	Good	Fair	Excellent	Fair	Fair	Excellent	Good
Resistance to heat aging at 100° C.	Fair	Fair-good	Excellent	Fair-good	Good	Good	Fair
Resistance at low temperature	Good	Good	Good	Excellent	Fair	Fair-good	Good

III. MANUFACTURING PROCESSES

Mention has already been made at the beginning of this article of the principal developments in the evolution of the industry.

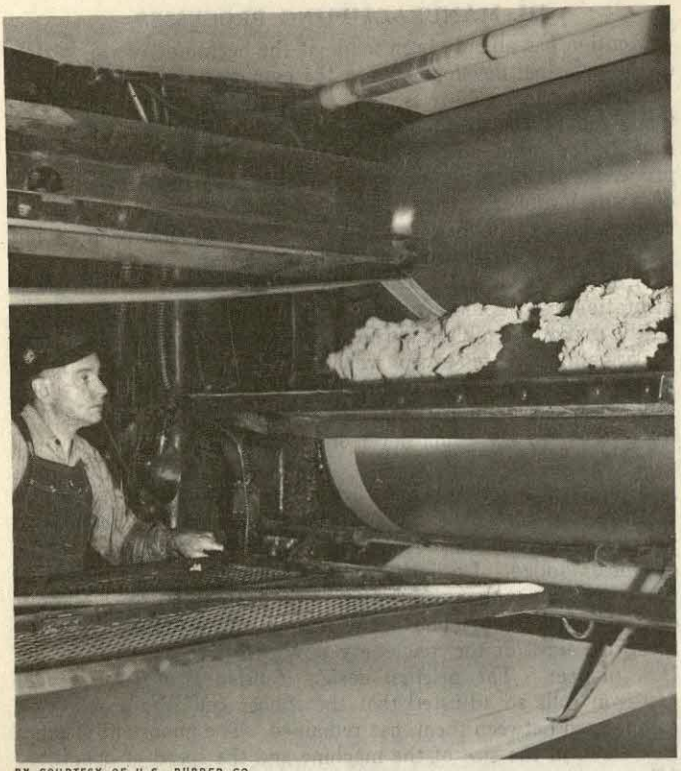
While natural rubber is more easily manufactured than synthetic rubber, the manufacturing processes for the two forms are roughly the same. Table III compares the salient features and properties of the most commonly used synthetic rubbers with those of natural rubber. The criterion of success of these synthetic rubbers lay not in their resemblance to the natural product but rather in their improved functional properties.

1. Washing and Drying.—Before the advent of high-grade plantation rubber and synthetic supplies, wild rubber often came on the market in adulterated form. The practice of washing rubber has almost ceased except when dealing with small quantities of wild rubber. Similarly, the practice of drying rubber after it has been washed has almost been abandoned; where it continues it is usual to dry in a vacuum dryer or by warm air.

2. Masticating.—After the rubber is cut, it is placed in a mill that first masticates and then compounds it. There are several types of such machines but the purpose of all of them is to plasticize the rubber and ensure a uniform dispersion of the chemicals added. Until the reappearance of internal mixers in the 1920s, more than 100 years after Thomas Hancock discovered the process of rubber mastication, developments followed along the lines of the machinery devised by E. M. Chaffee, the U.S. pioneer. The original design, consisting of two parallel cast-iron rolls so adjusted that the rubber could be ground and compressed between them, has remained. The important changes have been in the size of the machine and the speed of operation. Mixing mills vary from 20 to 84 in. in length and 16 to 28 in. in diameter. The rolls of 84 in., regarded as the mechanical limit, are capable of handling a batch of 300 lb. of rubber in 25 to 40 min. The rolls are water-cooled internally. The tremendous power of these two rolls, operating at different speeds (the back roll turns faster than the front one; speed ratios from 1.2:1 to 1.5:1 are customary), coupled with slight oxidation and the heat generated by the resulting friction, eventually reduces the chunks of cold rubber into a plasticized sheet that adheres to one of the cylinders.

As the demands for manufactured rubber products have grown, and the need for larger, faster and more powerful machines has been felt, there has been a tendency to return to the earlier enclosed mixing machines, along the lines of Hancock's pioneering masticator. About three-fourths of the rubber consumed worldwide in the 1960s was processed in internal mixers such as the "Banbury." These machines, working by internal pressure and rotating parts, have a capacity ranging from 600 to 1,000 lb. As against the 25 to 40 min. required to handle 150 to 300 lb. of rubber on the external mixer, the internal mixers may reduce this to 5 or 8 min. In addition to saving time these machines produce a much more uniform product than that dependent on hand operations on the external mill. On the other hand, the high power requirements and the fact that the process is essentially batch-type mixing rather than continuous flow have led to the development of mixer-extruders and to experiments with a new kind of open three-roll mill, which mixes and compounds the rubber and delivers it in a continuous sheet. Milling and mixing procedures vary according to the kind of rubber used.

3. Compounding or Mixing.—When the rubber is sufficiently masticated and softened either on an external or internal mill, it is ready to have the dry pigments added. This is one of the most



BY COURTESY OF U.S. RUBBER CO.

CALENDER, OR COATING MACHINE, WHICH PRODUCES RUBBERIZED FABRICS AND RUBBER SHEETING

critical stages in rubber manufacture. There are a few uses of rubber, for example in adhesive tape and rubber cements, where natural and synthetic latices are used in the raw, *i.e.*, uncompounded, state. However, these rubbers are sensitive to temperature changes and cannot be employed where resilience and toughness are needed, and consequently nearly all rubbers, natural or synthetic, are treated with varying amounts of general compounding ingredients (see *Raw Materials of the Industry,* above). The same classes of ingredients—plasticizers, fillers, reinforcing materials, antioxidants, lubricants, accelerators (stabilizers), activators, colorants and curing (vulcanizing) agents—appear in most formulations but the quantities of each, and the type selected within each class, depend on the material to be treated and the physical and chemical properties desired in the finished product. There can be few industrial processes where generalizations are so misleading.

Hard rubber, or ebonite, requires among other things a high proportion of sulfur in the mixture. Articles made directly from latex do not require plasticizers and softeners. With synthetic rubbers—particularly SBR type rubbers—the proportional gain in tensile strength due to the incorporation of reinforcing agents is much greater than it is with natural rubber. Less sulfur is also required. Softeners are not so effective, and it is usual, because of the slow curing rate of synthetics, to use more or faster-acting accelerators (such as the thiazoles, thiuram disulfides or aldehyde amines). There are many differences between the compounding of the different types of synthetics. Nitrile, for instance, needs proportionately less sulfur and more accelerator than SBR. Butyl, unlike SBR, shows little improvement when treated with reinforcing agents, nor will it harden with the addition of sulfur as SBR does. In the production of neoprene the use of plasticizers and softeners is of importance and, more than that of any other synthetic, its successful use depends upon the amount of filler added. Although neoprene is different from natural rubber, its manufacture—even more so than for the other synthetics—presents no problem to standard rubber manufacturing plant procedure. The Thiokols have a great resistance to solvents and do not readily respond to softening and plasticizing ingredients. Their use is greatly increased by the fact that they are available as molding powder. Neither neoprene nor Thiokol rubbers can be vulcanized with sulfur; metallic oxides such as magnesium oxide and zinc oxide are used instead. The compounding of the new polyisoprene rubbers is expected to follow the lines employed in the manufacture of SBR.

Compounding ingredients are usually worked into the raw material on an open mill by the process of "cutting back and forth," the rubber being cut away from the roll by means of a sharp knife and fed back again between the rolls until the ingredients have been uniformly dispersed. In the case of an internal mixer the ingredients are paid in. In the manufacture of both synthetic and natural rubber the ingredients are added in a certain order, plasticizers and softeners usually preceding fillers and other pigments, with the curing agents being added last of all.

4. Calendering.—The calender, or coating, machine is equipped with adjustable hollow rollers and produces sheeted stock of predetermined size and thickness. It can also be used to coat fabric with rubber. In practice, most calenders consist of three rolls arranged vertically. But there are many four-roll calenders and some two- and six-roll machines. The rolls can be operated independently or together over a wide range of speeds. They are automatically raised or lowered according to the thickness of rubber desired, and they are heated or cooled by passing either steam or cold water through them. Sizes range from 12 in. in length and 6 in. in diameter to 92 and 36 in. respectively.

In the sheeting of rubber, the warm unvulcanized compounded rubber is fed between the two top rolls, passed round the central roller and under the lower roller, and then carried to other parts of the mill for further processing. The rolls usually operate at the same speed, or the middle and bottom rolls may turn one and a half to three times as fast as the top roll. Special rolls with embossed or engraved surfaces are used for rubber footwear and matting. Where rubber-covered cloth or canvas is required, the rubber is placed between the top and the middle rolls while the fabric is fed between the two bottom rolls. The middle roll revolves one and a half to three times faster than the others and the discrepancy in speed "frictions" a thin film of warm rubber into the fabric. When the rubber is not to be pressed into the cloth but is merely to be applied as a coat to the surface, the "skim coat" method is employed. It allows lightweight coatings of rubber to be applied without revealing the texture of the underlying fabric, and it is usually used on fabric that is already frictioned. Frictioning and coating may be repeated on the opposite side of the material. Important modern changes in calender design and operation have sprung from the needs to meet the increasing demands for plastic (especially polyvinyl chloride) as well as rubber sheeting. Some of the best rubber calenders are being used for the vinyl resins.

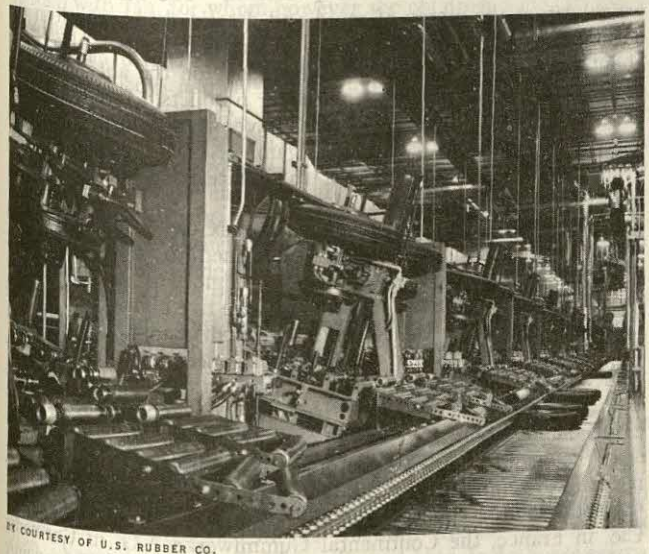
5. Spreading.—The spreading and proofing machine is sometimes used as an alternative to the calender. In the mid-20th century its design remains similar to the first spreaders developed more than a century ago. It consists of a hollow revolving drum, above which is a long piece of metal whose lower part tapers to an edge. This metal sheet is known as the spreading knife, or doctor. Both the roller and the knife are mounted at one end and level with the surface of a steam-heated table. The fabric to be proofed passes over the roll and underneath the knife, carrying with it—from a supply at the incoming side—a layer of dissolved rubber, which the knife distributes uniformly over the cloth. The material is then drawn over the steam-heated table to evaporate the solvent. In the case of single-texture fabric the operation is repeated until the desired thickness of rubber is obtained. With double-texture fabric, the two textures are coated and then forced together between metal rolls under high pressure, so that the coated surfaces unite permanently. Rubberized fabric has many uses other than waterproof clothing.

6. Extruding.—When the rubber is to be shaped into strips or tubes rather than sheets it is put into an extruder, a device for forcing compounded heat-softened rubber through orifices or dies. The rubber is ground in the machine and forced through a heated die by means of a screw. The extended material retains the shape of the die, which may be, for example, circular or rectangular in cross section and which has a diameter varying from 1 to 8 in. When first constructed in the 1880s, extruders were simple ma-

chines used for producing both cushion and solid tires. Modern extruders are complex, with a wide range of output. They are employed for the production of tire tubes, treads and cable covering; and they have eliminated the need to mold certain articles.

7. Vulcanizing (Curing).—*Hot Vulcanization.*—If rubber is heated with sulfur it not only changes to a relatively nonthermoplastic material, but it also increases in elasticity, strength and resilience. Vulcanization is a type of polymerization in which cross-linkages are formed between the long chainlike molecules of rubber, forming a three-dimensional structure. Although means have been developed to vulcanize rubber without either sulfur or heat, sulfur remains the chief curing agent and hot vulcanization is still the process most generally used. Even in so-called sulfurless cures, such as with tetramethylthiuram disulfide and the polysulfides, the curing agent is still sulfur, which is released by these chemicals under vulcanizing conditions. At first the "vulcanizer" was a simple steam-heated chamber fitted with a mobile rack on rails on which the rubber goods—cut into their final shapes—were subjected to heat, the sulfur having previously been added at the compounding stage. Gradually it was realized that for the production of well-formed homogeneous rubber this process was inadequate and that curing needed to be done under pressure. In the last quarter of the 19th century steam-heated hydraulic presses giving pressures of 100 to 800 lb. per square inch of platen surface were introduced. In the 1960s pressures between 4,000 and 8,000 lb. per square inch were possible.

Articles to be molded are generally both molded and vulcanized in one operation. The steam is conveyed to the molds from steam-heated platens and from there directly to the rubber. Cast-iron molds were replaced first by improved steel molds and later by aluminum molds. Some companies developed an intermittent method of press operations that amounts to almost continuous curing. Hollow articles like syringe bulbs and balls are vulcanized under inflation either by air or by nitrogen generated by the action of heat upon a mixture such as sodium nitrate and ammonium chloride in pelleted form. Special presses are used for curing long, flat belts and matting, a section of 20–36 ft. being cured at one time. Conveyor belt and sheet flooring can be continuously cured on a U.S. machine originating from developments in the linoleum trade. Tires are cured in a steam-jacketed mold, which is subjected to powerful internal steam and air pressure that forces the tread and sidewall of the tire into the design cut into the metal mold. Average passenger-car tires are vulcanized in 20 to 30 min. at a temperature of 300°–320° F. (148°–160° C.). The molds for the making and vulcanizing of inner tubes, like those used for the tire casings, are also steam-jacketed. The rubber-hose branch of the industry employs lead presses that make possible the continuous curing of hose up to $2\frac{1}{4}$ in. in diameter. Sometimes hot water is applied to the inside of the hose, while steam heat is applied externally. Insulated wire is cured by a continuous process: as the coated cable comes from the extruder it is passed through a special valve into a superheated steampipe where high temperatures effect a cure in about one minute.



BY COURTESY OF U.S. RUBBER CO.

POST INFLATION PROCESS IN TIRE MANUFACTURE

When tires are removed from vulcanizing molds which give them shape and tread, they are inflated to high pressures and allowed to cool. This process is designed to relieve internal stress. The tires then move by conveyor to further finishing processes

Some items, such as rubber sheet to be cut into thread, are immersed in hot water at the bottom of the autoclave. By this means higher pressures are obtained than with steam at the same temperature, and the possibility of oxidation and discoloration is avoided. Large items are sometimes vulcanized in boiling water in open tanks.

High-Energy Radiation and Radio-Frequency Heating.—These are relatively new vulcanization processes awaiting further development. Thick rubber articles placed in an intense field of radio waves of 5 to 30 mc. can be heated and vulcanized more quickly than is possible with steam heat. In a nitrogen atmosphere high-energy radiation by high-speed electrons can vulcanize sheets of rubber 0.20 in. thick in 20 sec. No sulfur is required. As knowledge of beta and gamma ray sources has grown, vulcanization by high-energy radiation has attracted increasing attention.

Cold Vulcanization.—Sulfur chloride curing was discovered by the Englishman Alexander Parkes in 1846. This process permits the vulcanization of thin-walled rubber articles (such as thin sheeting, gloves, balloons and single-texture garments) by immersing them in sulfur monochloride dissolved in liquid carbon disulfide, or by subjecting them to a gas of the same chemicals. The Peachey cure makes use of sulfur dioxide or hydrogen sulfide. In the 1960s cold vulcanization was being employed increasingly with synthetic rubber and rubberlike materials, some of which, like Thiokol, do not require the addition of sulfur in any form. This tendency was particularly noticeable where waterproofed fabrics are concerned.

8. Direct Use of Latex.—Mention of the problems of transporting *Hevea* latex from the plantations of the east to the industrial centres of the west has been made elsewhere (see *Raw Materials,* above). The advantages of using rubber in its liquid form were evident from the beginning of the rubber industry; *e.g.,* the physical properties of products made directly from latex are superior to articles prepared from solutions of crude rubber, and their preparation is simpler and cheaper.

Dipping.—Latices are compounded along the same lines as rubber used for other purposes. Most formulations contain stabilizers, plasticizers, colours, fillers, antioxidants, accelerators and vulcanizing agents. The basic process consists of dipping a solid object ("former") into the latex and allowing the film that forms to dry, then vulcanizing it. By this method tire cords are impregnated, medical and surgical supplies and electricians' gloves made, textiles waterproofed, footwear impregnated and rubber yarns and thread obtained. The development of latex thread, which is much finer than cut thread, had a considerable impact upon the clothing industry.

Most multiple dip goods (goods that have to be dipped more than once) are made by the coagulant method, in which the former is immersed in a coagulating solution either before or after it is dipped into the latex. The "heat-sensitive" dipping process depends on the fact that latex may be coagulated by heat and that therefore a hot former picks up a heavier coating than a cold one. The addition of polyvinyl methyl ether to latex increases its sensitivity to heat and when a hot shape is immersed in a mixture of these two substances the layer of coagulum forms quickly. This process, discovered by the Germans during World War II and developed further by the British, is probably the most important technical advance made in the 1940s. Several electrical processes have been devised to assist the building-up of latex film on formers; these are especially useful for coating irregularly shaped articles. The method of electrolytic deposition employs direct electric current to deposit the latex, the form to be coated being used as the anode in an electrolytic system. A method that is employed with natural, but has little application for synthetic, latex is the use of dry porous forms made of plaster of Paris, which, when dipped

(TOP) WHIPPED LIQUID LATEX BEING POURED INTO MATTRESS MOLD; (BOTTOM) FOAM RUBBER MATTRESS BEING REMOVED FROM MOLD. EACH MATTRESS IS MOLDED AND CURED SEPARATELY

into the latex, dehydrate the film that has been deposited.

Prevulcanized latex compounds were first used by P. Schidrowitz in England about 1920. However, the tensile strength of articles made from this prevulcanized latex is usually lower than that of articles made from latices that are vulcanized after they have been dipped or molded.

Latex Foam.—One of the most interesting and important developments in the use of natural and synthetic (mostly neoprene and some SBR) latices is their application as latex foam, or sponge rubber. A new and extensive market grew up for latex-foam upholstery, automobile seating, mattresses and pillows. The manufacturing process consists of frothing up the latex, which has been compounded with the usual ingredients together with soaps and special gelling agents such as sodium silicofluoride, polyvinyl methyl ether or ammonium-zinc compounds. The foam is produced by continuous process on a foam whipping machine and contains approximately 85% air and 15% rubber. It is poured into molds and vulcanized in hermetically sealed vulcanization units. The products are then washed and dried in electrically heated drying chambers. Another process of manufacturing foam rubber mixes the latex with hydrogen peroxide and the enzyme catalase from live yeast. The oxygen released by the action of the catalase on the hydrogen peroxide blows up the foam, which is then frozen, coagulated with carbon dioxide and vulcanized in the wet state.

9. Productivity.—In the absence of comparative data from which it would be possible to assess the output of the rubber industry at different times, it is not possible to calculate the changes in productivity per worker within the industry. One estimate of the amount of rubber processed by each worker in the United Kingdom during the period 1850–1950 shows that the consumption of crude rubber in long tons per wage earner in the U.S. and British industries increased from approximately one ton in 1850 to about three tons for the United Kingdom and more than six tons for the United States in 1950. The gradual rise in productivity must be largely ascribed to improved methods of production. The higher consumption of the U.S. rubber worker is possibly accounted for by specialization in that industry, the greater power and capital resources of U.S. rubber firms in comparison with those of other countries, and the tendency to replace hand labour with technically superior machine processes and automation.

IV. CONSUMPTION

1. Consumption by Countries.—The most significant trend discernible in consumption is the swing from natural to synthetic supplies. The situation in the 1960s, as compared with 1940, showed that the majority of the rubber consumed was of a synthetic nature. By 1960, certain countries, such as the United States, were consuming smaller quantities of natural rubber than they did in 1941. Even the British, with their connections in the east, were rapidly reaching that position. Developments in the petrochemical industry made available at economic prices raw materials for synthetic rubber production.

2. Consumption by Products.—The market for manufactured rubber commodities has passed through three stages. First, before the advent of the vulcanization process in 1839, there were the crude attempts at rubber footwear and waterproof clothing. Of the two countries that have dominated the rubber trade, the United States and the United Kingdom, the former led in the manufacture of footwear, the latter in the manufacture of waterproof clothing. The footwear industry remained the greatest single market for rubber until the introduction of the automobile. Secondly, from the 1840s to the end of the 19th century, rubber was used increasingly for many purposes where prior to vulcanization it had proved unsuitable. In particular, the growth of industrialization since the 1850s in North America, Europe and other parts of the world, coupled with the improvement of the vulcanizing and manufacturing process, greatly accelerated the application of rubber to mechanical devices. These devices, such as hose and tubing, packing and washers, springs and rings (especially in the field of railway mechanical devices), belting, diaphragms, etc., played an important part in the development of modern transport and manufacturing processes. The manifold demands of the growing electrical industry provided a vast new market, particularly for hard rubber. The third and most expansive stage has lasted from the beginning of the 20th century to the 1960s and is bound up with the enormous demands of the pneumatic tire and the automobile industry generally.

3. Consolidation and Competition.—The industry has always been at the mercy of rapid and drastic changes both in the cost of raw rubber and the prices of finished goods. Also, since about 1920, it has been largely dependent on the automobile industry, the biggest consumer of rubber products. In consequence of these susceptibilities, small firms have often been in difficulties and the tendency has been to amalgamate. The industry has also concentrated its forces in order to finance its rapid growth and vigorous research programs.

In the 1960s the picture was a complex one. While the total number of rubber undertakings continued to grow throughout western Europe and America, control of most of the market was passing into fewer hands, especially in the tire division. Thus the United States tire establishments declined in numbers from 178 in 1921 to 57 in 1947, and the trend continued; by 1960 the Goodyear Tire and Rubber Co., the United States Rubber Co., the B. F. Goodrich Co. and the Firestone Tire and Rubber Co. together had a larger share of the gross output of the U.S. industry than they had had 20 years before. In Britain the number of rubber workers employed by the Dunlop Co. was as high as 50% of the total for the country, and the same was true of Michelin et Cie. in France, the Continental Gummiwerke A.G. in Germany, and the Società Italiana Pirelli. This concentration of economic power did not appear, however, to have lessened the competitive and progressive nature of the industry.

RUBBER TILE: *see* FLOOR COVERINGS.

RUBELLITE, a red variety of tourmaline used as a gemstone. It generally occurs crystallized on the walls of cavities in coarse granitic rocks, where it is often associated with a pink lithia mica (lepidolite). The most valued kinds are deep red, the colour being probably due to the presence of manganese. Some of the finest rubellite is found in Siberia. Other localities include the island of Elba, the Urals, Burma, and Minas Gerais, Braz. Fine rubellite is found in the United States, notably at Paris, Me., where the crystals are often red at one end and green at the other. Mt. Rubellite near Hebron and Mt. Apatite at Auburn are other localities in the same state from which fine specimens are obtained. Chesterfield, Mass., also yields red tourmaline, frequently associated with green in the same crystal. Pink tourmaline also occurs, with lepidolite and kunzite, in San Diego County, Calif. For discussion of composition, crystal forms, electrical and optical properties, etc., *see* TOURMALINE.

RUBENS, PETER PAUL (1577–1640), Flemish painter and diplomat, was born at Siegen, Westphalia, June 28, 1577. His father Jan Rubens, although born a Roman Catholic, had appeared on a Calvinist list as early as 1566. After the decapitation of the counts of Egmont and Horne in Brussels in 1568, Jan fled from Antwerp to Cologne with his wife Maria Pypelincx and their four children, there to become agent and adviser to Anne of Saxony, second wife of William the Silent. An unfortunate pregnancy revealed in this princess of Orange the extent of her relationship with Jan, for whom however she obtained some clemency from her husband. Jan was nevertheless under house arrest at Siegen when both Peter Paul and his elder brother Philip were born. These boys had their grounding in the classics from their exiled father, a *doctor utriusque juris*. But Jan died in 1587, after he had been allowed to go back to Cologne. Maria then thought it prudent to bring her four surviving children to Antwerp, where their father had been an alderman.

Antwerp Training.—At the age of ten, Peter Paul was sent with Philip to the Latin school of Rumoldus Verdonck, where the future painter befriended a contemporary who was to be a future patron, as head of the Plantin press, Balthasar Moretus. In 1590 shortage of money, and the need to provide a dowry for his sister Blandina, forced Maria to take Peter Paul away from school and make him a page to the countess of Lalaing. Soon tired of courtly life, he was allowed to turn to his real vocation. He was sent first to his kinsman Tobias Verhaecht, a painter of mannerist landscapes in the stale tradition of Joos de Momper. Having quickly learned the rudiments of his profession he was apprenticed for four years to an abler master, Adam van Noort, and subsequently to the most distinguished of the Antwerp Romanists, Otto van Veen. Vaenius, as he called himself, had been in Italy an active admirer of Federigo Baroccio as well as of the strictly Roman tradition in painting, and was learned in emblems. His culture and vision impressed Rubens, whose earliest independent works are known to have resembled his style.

Italian Period.—In May 1600, with two years' seniority as a master in the Antwerp Guild of St. Luke, Rubens set out with Deodati del Monte, his constant traveling companion and first pupil, for the visual and spiritual adventure of Italy. Reaching Venice in about a month, he had early the fortune to meet a gentleman in the service of Vincenzo I Gonzaga, duke of Mantua. He was offered employment in Mantua, which duchy held the largest and finest collections outside the Vatican of works from all Italian schools. Its capital, moreover, was ideally placed for sightseeing in Lombardy, Emilia and the Veneto. During the eight years that Rubens was to call Vincenzo his lord he had unmatched opportunities of fulfilling his expressed intention "to study at close quarters the works of the ancient and modern masters, and to improve himself by their example in painting." Andrea Mantegna and Giulio Romano were his admired predecessors in Gonzagan service. The abundant achievement in decoration and architecture of Giulio Romano, artistic heir of Raphael, had a lasting and highly productive effect on him.

Recommended to Cardinal Montalto in Rome, Rubens was sent (1601–02) to paint copies for the duke. There, through his Flemish connection, he obtained his first public commission, three altarpieces for the crypt chapel of St. Helena in Sta. Croce in Gerusalemme, formerly titular church of the cardinal Archduke Albert, who was by this time consort to Isabella, regent of the Spanish Netherlands. In Rome, Annibale Carracci and his school were at work in the Farnese gallery. From their bold scale in drawing and characteristic working methods Rubens formed the decisive habits of his life. Through Annibale's example he was first enabled to digest the power of Michelangelo. Raphael and Leonardo da Vinci were his other High Renaissance heroes for nobility and energy of design. He assimilated Venetian colour, light and application of paint first through the works of Tintoretto, then through those of Veronese, long before he could penetrate the inward meaning of Titian's art. His copies, and his reworking of drawings, offer the most complete conspectus of 16th-century achievement in a pungently personal revision.

In 1603 he was entrusted with his first embassy, to bring Philip III and the Spanish court costly presents from Mantua. This mission gave him a first view of the Habsburg treasures, including more than 70 works by Titian. Two paintings in the groups of copies offered to Philip's favourite, the duke of Lerma, being rain-sodden beyond repair, were promptly replaced by him with a "Democritus and Heraclitus" of his own invention. His resource, and his tact with the regular Mantuan agent at Valladolid, whither the Spanish court had moved, raised him in Vincenzo's estimation and prepared him for future diplomatic voyages. His equestrian portrait of the duke of Lerma initiated his masterpieces in this genre; its pattern of presentation inspired Van Dyck. His fruitful association with the banking patriciate of Genoa began with his return voyage and his meeting with Nicolò Pallavicini, Vincenzo's banker, in order to recoup expenses.

His only major work for Mantua, a conspicuous challenge to the memory of Michelangelo, Raphael and Tintoretto, was the threefold decoration for the Jesuit church of SS. Trinità. Nothing of his but portraits of court beauties was commissioned for the Gonzaga gallery itself, although he induced Vincenzo to buy for the gallery Caravaggio's rejected "Death of the Virgin," and he negotiated the purchase of a Cristofero Roncalli for the duchess. After his work for SS. Trinità (1604–05) and for the high altar of the Jesuit church in Genoa (1605), he obtained leave to continue his studies in Rome. There he shared a house with his brother Philip, then secretary and librarian to Ascanio Cardinal Colonna. Daily contact with Philip, the most brilliant pupil of Justus Lipsius and the hope of classical studies, added zest to his personal renascence of the antique world. The combined fruits of their learning were strung into the text and illustrations of *Electorum Libri II* (1608), published by the Plantin press. Apart from a summons in 1607 to accompany the Gonzagan court on a summer progress to the seaside resort of San Pier d'Arena, where he invented splendid means to portray the Genoese aristocracy, Rubens was left largely undisturbed. But chronic arrears in payment of his salary, and ambition to establish himself as a metropolitan, not just a Man-

"DESCENT FROM THE CROSS," ALTARPIECE BY PETER PAUL RUBENS DONE IN 1610. IN THE ANTWERP CATHEDRAL

tuan, painter, caused him to seek the backing of a Genoese patron, Jacopo Serra, in obtaining the coveted commission at the Chiesa Nuova. The protracted difficulties of this work for the Roman oratory, during which he brought off at speed a superb altarpiece for the Oratorians of Fermo, still occupied him when, in Oct. 1608, his brother Philip, already back in Antwerp, summoned him to their mother's death bed.

Return to Antwerp.—Riding from Rome in haste, Rubens was nevertheless too late to see his mother alive. His first altarpiece for the Chiesa Nuova, which had been offered in vain to Mantua, became at last her monument. Although soon "bound with golden fetters" to the service of the Habsburg regents in Flanders (Sept. 23, 1609), then and for long after Rubens contemplated a return beyond the Alps to re-enter the lists of the Roman painters. As late as the 1620s he supplied cartoons to Genoa. Of six languages which he used with ease, Italian remained his favourite for correspondence. The house which he built for himself, the pride of Antwerp, had a model Pantheon which he enriched with statuary, cameos, coins and jewels. *Palazzi di Genova* (1622) was his published souvenir of civilized modern architecture. He practised the spirit of his preface in the magnificent new church of the Antwerp Jesuits, St. Charles Borromeo, where he, assisted in the execution of ceiling paintings by Van Dyck, was the master decorator and, with Peter Huyssens, the chief designer of the façade, tower and all architectural detail. This building, with the almost contemporary banqueting house designed by Inigo Jones at Whitehall, London, where Rubens was to achieve his long-cherished ambition to fill the huge ceiling with paintings (delivered 1634), was the architectural sensation of northwest Europe.

He settled in Flanders, marrying Isabella, daughter of Jan Brandt, the Antwerp lawyer and humanist (Oct. 1609), and establishing himself not only as court portraitist but, by a trilogy of altarpieces, as the leading painter of his country. These altarpieces were: the fully baroque "Erection of the Cross" for St. Walpurga's, Antwerp (1610), a mature criticism of his treatment of the subject in Sta. Croce in Gerusalemme; the more classical "Descent from the Cross" for Antwerp cathedral; and for the cathedral of St. Bavo, Ghent, "The Miracle of St. Bavo," which, although conceived as a triptych like the others, was much modified to fit a single field. Relieved of the obligation to live at the Brussels court he was also exempt from guild regulations, and so free to engage pupils or collaborators without having to have them enrolled. By 1611 he wrote that he had to refuse more than 100 applicants to join his studio. As his international reputation grew, in part through careful organization of printmaking to advertise his designs, numbers of large-scale works issued from his studio which were only in certain areas, or generally retouched, by his hand. But to almost the last year of his fabulously productive life he painted unaided a superior class of very large works, as well as of cabinet pieces, oak panels being favoured for their supports. During 1606–07 he used small panels prepared with gesso for the various categories of oil sketches required to facilitate his manifold activity: sketches to work out his pictorial ideas, to present models to clients or to instruct engravers, sculptors, tapestry weavers and painting assistants. They are small works in inches only, marvellous drawings in paint, whether *en grisaille* or fully coloured. But he never entirely abandoned the Renaissance practice of evolving compositions in chalk and ink.

Diplomatic Activity.—Archduke Albert died in 1621, the year in which the 12 years' truce between Spain and the Netherlands ended. Rubens became adviser to the widowed archduchess, of whom he was to write (1628): "Long experience has taught her how to govern these people and not to be taken in by false theories which every newcomer brings from Spain." She, like him, desired to prolong peace. France grew suspicious. The French ambassador wrote from Brussels (1624): "Rubens is here to take the likeness of the prince of Poland, by order of the infanta. I am persuaded he will succeed better in this than in his negotiations for the truce." Early in 1622 Rubens had been summoned by Marie de Médicis, whose wedding by proxy he had attended in Florence in 1600, for his first visit to Paris. After six weeks of discussion he returned to Antwerp to begin work on the *Histories of Marie de Médicis* for the walls of the first of two great galleries to be decorated by him in her new Luxembourg palace. This cycle of 21 canvases, his most important secular commission, was completed in two years. Being again in Paris for their installation in 1625, he met the duke of Buckingham, to whose persistence in bidding high for his famous collection of antiquities and paintings he was eventually to accede for diplomatic reasons. Buckingham was in Paris for the marriage by proxy of Charles I and Henrietta Maria of France. With him was his master of the horse, painter and agent, Sir Balthasar Gerbier. Secret correspondence between Rubens and Gerbier was maintained even after the fresh outbreak of war between England and Spain, which led to Buckingham's disastrous expedition to Cádiz. Not until the assassination of the Stuart favourite was the way reopened for Rubens to negotiate peace on behalf of the sorely tried Spanish Netherlands. He described Antwerp to Louis XIII's librarian as "languishing like a consumptive body, declining little by little." Unfortunately Philip IV's minister, the count of Olivares and duke of SanLúcar, known as the *conde-duque,* had persuaded his master to make a close pact with France to reconquer England for Catholicism. In 1628 Rubens had therefore to travel in secret haste to Madrid. The papal nuncio reported of his arrival: "It is considered certain that Rubens, the Flemish painter, is the bearer of a negotiation, for we hear that he often confers in secret with the *conde-duque,* and in a manner very different from that which his profession permits. They say that he left England a short time ago; and since he is said to be a great friend of Buckingham, it is believed that he comes with some peace treaty between the two crowns. Others think his main object is the truce of Flanders, and that he has received this commission as one who enjoys the confidence of all that country."

During nine months in Madrid, besides negotiations and royal

portraiture, Rubens set himself to school again before Titian's masterpieces, revisiting the Escorial with Velázquez. He overcame Philip IV's prejudice against him as a suitable negotiator, and was named secretary of the privy council of the Netherlands to conduct a special mission to England. He hastened across France, past the hostile Richelieu, to report to Archduchess Isabella. News awaiting his return to Brussels made his mission yet more urgent and difficult. England had made a treaty with France (April 24, 1629). Charles I wished to treat with Rubens as a plenipotentiary, without waiting for the exchange of regular envoys. The Dutch alliance and the restitution of the Palatinate were crucial to Anglo-Spanish relations. Rubens succeeded, however, in laying the groundwork for the peace treaty (Nov. 15, 1630). For this he was knighted by Charles I and given an honorary degree by Cambridge university. "The Blessings of Peace," (National gallery, London), featuring Gerbier's children, is his painted proclamation of success. He discussed painting with Charles I, the only prince to whom he vouchsafed a self-portrait (Windsor castle), and, in particular, projects for the Whitehall ceiling. He was struck by the beauty and peacefulness of the English scene. The "Landscape with St. George" (Buckingham palace) was his private souvenir of the Thames view from his lodgings, with the royal pair envisaged in masquerade as patron saint and rescued princess. But a general peace was far away. His letter of March 12, 1638, explains "The Horrors of War," a late masterpiece sold to the Medici in Florence. He identifies the figures of the allegory: "that grief-stricken woman clothed in black, with torn veil, robbed of all her jewels and other ornaments, is the unfortunate Europe, who for so many years now has suffered plunder, outrage, and misery."

Later Works.—On his return to Flanders in 1630 Rubens was rewarded with exemption by the archduchess from further diplomacy. "This favour I obtained with more difficulty than any other she ever granted me," he was to write. "Now, for three years, I have found peace of mind, having given up every sort of employment outside my beloved profession."

THE BETTMANN ARCHIVE

"SIEGE OF JULIERS," ONE OF 21 PAINTINGS ILLUSTRATING THE LIFE OF MARIE DE MÉDICIS. IN THE LOUVRE

Having been four years a widower he married (Dec. 1630) the 16-year-old Helena Fourment, whose charms recur frequently among his later figure subjects. Many of his grandest and most romantic interpretations of landscape belong to this decade of his retirement from court affairs, when he owned the Château de Steen. But his active interest in landscape had been unbroken since at least the drawings of his Roman period. Long-established interests were revived also in his co-ordination of the work of every Antwerp painter for the stagings designed and partly executed by him to welcome the Infante Ferdinand, successor to Archduchess Isabella, in 1635. Thirty-six years before, he had assisted Vaenius to convert their city into a theatre. The great commission of Rubens' last years was, however, for the infante's brother Philip IV, the provision of models for about 120 scenes from Ovid to decorate the Torre de la Parada near Madrid.

Rubens died at Antwerp on May 30, 1640, when gout, which had for months troubled his painting arm, reached his heart.

Achievement.—Rubens remains unchallenged even by the longer-lived Picasso as the most methodically assimilative, the most prodigiously and variously productive among European artists. Schooled in the congested traditions of Antwerp mannerism, he educated himself to be heir of the full range of Renaissance design to be seen both north and south of the Alps. And he saw the masterpieces of the Renaissance as yet undisturbed from their intended places. The abundant energy and warmth of his nature not only fired him to emulate the masters both of antiquity and of the 16th century in Rome, Venice and Parma, but made him responsive to the artistic revolutions being worked by living artists: to Adam Elsheimer's *plein air* study of nature and times of day in the Roman campagna; to Federigo Barocci's colour combinations and delicate appreciation of warm and cool tones vibrant on flesh; to Michelangelo da Caravaggio's emotive exploitation of strong chiaroscuro; and, most profoundly and lastingly, to Annibale Carracci's impassioned yet strenuously disciplined approach to the practice of figure composition.

Robust powers of comprehension nourished his limitless resource in invention. The larger the scale of the undertaking the more congenial it was to his spirit. The success of his public performance as master of the greatest studio organization in Europe since Raphael's in Rome has obscured for many the personal intensity of his vision as evinced in such works as his oil sketch for "All Saints" and in his deeply felt study for the head of St. John in the Antwerp "Descent from the Cross," as well as in portraits of his family and friends and in his treatment of the mood and grandeur of landscape. Not only Van Dyck, Jacob Jordaens and his immediate following in Flanders, but artists at almost every period have responded to the force of his genius. Giovanni Lorenzo Bernini, the other seminal mind of the early baroque, developed in his Roman altarpieces figurative ideas and the dramatic handling of light instituted by Rubens. And in the fulfillment of the Italian baroque Domenico Feti, Castiglione and Bernardo Strozzi are in individual ways Rubensians. Watteau, Fragonard, Delacroix and Renoir are only the four most distinguished in the long succession of French painters who were attracted after the late 17th century to some aspect of his production. Reynolds, Gainsborough, and Constable are outstanding among his English admirers. In the history of western art he is a central figure.

His own deepest love as a painter, consummated by his second visit to Spain, was for the poetry, the control of glowing colour and the sheer mastery in handling of oil paint that excelled in the art of Titian. In these qualities Rubens himself became supreme, whether with the brilliant play of fine brushes over the white reflecting surface of a small panel, or with masterful gestures often more than six feet long, sweeping a richly loaded brush across some huge canvas.

RUBIACEAE, the madder family, a large family of angiospermous flowering plants, dicotyledons, belonging to the sympetalous order Rubiales and containing about 450 genera with approximately 5,500 species. The Rubiaceae have a world-wide distribution with centres in the tropics of the old and new worlds. They vary in form from herbs to trees, but most of the species are inconspicuous and subordinate elements of the vegetation. Some, such as coffee and quina bark trees, have attained major economic importance. Well-known British and North American examples of Rubiaceae are species of *Galium* such as bedstraw (*q.v.*), woodruff, cleavers (*q.v.*), etc.

Rubiaceae are characterized by opposite (or whorled), entire stipulate leaves, rotate sympetalous flowers, mostly with four or five lobes to the corolla and the same number of alternate stamens. The ovaries are nearly always inferior with a single style. The Rubiaceae have probably been derived from ancestors closely allied to recent Loganiaceae (Contortae) by gradual submergence of the superior ovary.

The taxonomy of the Rubiaceae is still a matter of some debate. Six subfamilies with many tribes may be recognized: Cinchonoideae, Urophylloideae, Ophiorrhizoideae, Guettardoideae, Ixoroideae and Rubioideae. The general phylogenetic trends within the family are manifold. Their form varies from woody trees and shrubs, predominant in the tropics, to dwarf shrubs, perennial and annual herbs, mostly found in subtropic, temperate and arctic-alpine regions. The leaves are mostly large and evergreen in tropical groups, often deciduous in temperate groups and needle- or scalelike in xeromorphic groups. The stipules tend to merge to medium stipular regions which in the Rubioideae develop from one to many leaflike stipules. In primitive groups of Rubiaceae the flowers are relatively large, single and situated in leaf axils; in derived groups they are reduced in size and combined into various kinds of inflorescences. From monomorphic hermaphrodite flowers the development is to dimorphic (long- and short-styled), or unisexual and eventually dioecious flowers. Further phylogenetic trends include shortening of corolla tubes, loss of calyces, reduction in the number of carpels from five and six to two, and of the number of ovaries per ovary chamber to one. Each chamber contains, depending on species, from one to numerous ovules. The fruits vary in form from dry capsules and drupes to schizocarpous nutlets which are sometimes covered with hooked hairs and similar devices for epizoic dispersal (*e.g.*, "cleaver" species of *Galium*).

JOHN H. GERARD

BUTTONBUSH (CEPHALANTHUS OCCIDENTALIS), WIDELY DISTRIBUTED IN MARSHES OF NORTH AMERICA

Pollination is effected by insects or birds (very rarely by the wind) or by self-pollination. Some fluctuations of the basic chromosome number and especially polyploidy (multiplication of basic chromosome number) have played an important role in the evolution of the family. Of biological interest are the tropical epiphytes (*Myrmecodia* and *Hydnophytum*), which develop swollen stems inhabited by ants. Other genera have leaves with symbiotic, nitrogen-binding bacteria.

Rubioideae species with whorled leaves and leaflike stipules are widespread in temperate regions; *e.g.*, common species in Britain are *Galium mollugo* (hedge bedstraw), *G. verum* (lady's bedstraw) and *G. aparine* (cleavers or goosegrass); in North America species of *Cephalanthus* (buttonbush), *Mitchella* (partridge berry), *Houstonia* (bluets, innocence), *Kelloggia* and *Galium* are found. Some of the Rubiaceae are of economic importance. The bark of *Cinchona* (*q.v.*) and some other tropical South American genera contain quinine (*q.v.*). Coffee is produced from the seeds of *Coffea*, particularly *C. arabica* and *C. liberica*. The ipecacuanha root (*Uragoga*) contains vomitive glucosids. Other species provide tanning and dyeing (*e.g.*, madder, *Rubia tinctorum*) substances. Some tropical trees furnish timber. Members of the genera *Ixora, Manettia, Bouvardia, Rondeletia, Gardenia, Phuopsis, Galium, Asperula* and others are of horticultural value. (F. EH.)

RUBICON, a small stream of ancient Italy, which flowed into the Adriatic between Ariminum (Rimini) and Caesena (Cesena) and formed the boundary between Italy and the province of Cisalpine Gaul in republican times. Hence Caesar's crossing of it in 49 B.C. meant a declaration of war against Pompey and the Senate (*see* CAESAR, GAIUS JULIUS). The historic importance of this event gave rise to the phrase "crossing the Rubicon" to describe a step which definitely commits a person to a given course of action. Augustus later made the Crustumium, modern Conca, a few miles farther south, the boundary of Cispadane Gaul and Umbria.

The modern Rubicone (formerly Fiumicino) is officially identified with the Rubicon, but the Pisciatello to the north and the Uso to the south have also been suggested.

RUBIDIUM, a rare chemical element of the alkali metal group, the most reactive of all metals except cesium (*q.v.*). The uses of rubidium and its compounds are limited but noteworthy. Its natural radioactive isotope, Rb^{87} (half life, 53,000,000,000 years), has been used to determine the age of the solar system. An estimated age of 4,500,000,000 years, based upon the decay of Rb^{87} to strontium (Sr^{87}) in a stony meteorite, is consistent with results based upon the decay of uranium to the final end product, lead. For the opposite extreme of precision, an atomic clock whose ticks are the natural vibrations of rubidium atoms has been proposed; ammonia clocks and cesium clocks are now in use. The purpose of such devices is to establish an invariant standard for time units, quite independently of the earth's rotation, which would be accurate to 1 part in 10,000,000,000 or more.

The discovery of rubidium (and of cesium), the first of many new elements to be detected by the spectroscope, was a crucial step in the development of the science of spectroscopy (*q.v.*). R. W. Bunsen and G. R. Kirchhoff, who perfected the spectroscope, used it to study alkali metal compounds extracted from the mineral lepidolite. They obtained a chloroplatinate whose flame spectrum had two unusually prominent red lines which did not match those of any known element. In their report, made in 1861, Bunsen and Kirchhoff told how they named the new element:

> The magnificent dark red colour of these rays of the new alkali metal led us to give this element the name rubidium and the symbol Rb from *rubidus*, which, with the ancients, served to designate the deepest red.

Although ranking 17th (0.031%) in the estimated abundances of the elements in the earth's crust, rubidium is widely dispersed among minerals (lepidolite, carnallite, and some feldspars) and mineral waters containing other alkali metals. The highest concentration of rubidium is found in lepidolite (lithium mica), the deposits of South West Africa containing as high as 3% of Rb_2O. To extract rubidium, the finely ground calcined mineral is treated with sulfuric or hydrochloric acid. Rubidium and cesium are then separated from the solution by fractional crystallization of generally of their alums, which are less soluble than those of lithium, sodium, and potassium. The rubidium may be partially separated from cesium by precipitation as chloride from a hot

Physical and Atomic Properties

Atomic number	37
Atomic weight	85.47
Outer electron configuration	$4s^2, 4p^6, 5s^1$
Density of solid at 20° C, g. per cc.	1.53
Melting point, ° C	38.89
Boiling point, ° C	688.
Ionization potential, volts	4.16
Potential for $Rb \rightleftarrows Rb^+ + e$, volts	2.99
Specific heat at 0° C, cal. per g.	0.080
Metallic radius, Å	2.16
Ionic radius, Å	1.48

HCl solution to which is added ethyl alcohol; or by precipitation as carbonate in ethyl alcohol. Rubidium may be quantitatively separated from the other alkali metal ions and from those of other metals in a column of cation exchange resin. Metallic rubidium can be prepared by heating the carbonate, hydroxide, or chloride with a suitable reducing agent; magnesium, aluminum, calcium, barium azide, $Ba(N_3)_2$, and calcium carbide have been used.

Rubidium is a silver-white metal which inflames in air, reacts vigorously with cold water liberating hydrogen and forming the hydroxide RbOH, a very strong base. Other properties are summarized in the Table.

The salts of rubidium resemble those of potassium and cesium; they are mostly ionic and those of the common acids, chloride, sulfate, nitrate, carbonate, and phosphate, are soluble in water. The perchlorate, acid tartrate, picrate, the hexafluorosilicate, hexanitrocobaltate, hexachlorostannate, hexachloroplatinate, and the tetrachloroantimonite are relatively insoluble. Some of the rubidium salts are used in microchemical analysis.

For bibliography *see* POTASSIUM. (J. B. Ps.)

RUBINSTEIN, ANTON GRIGORIEVICH (1829–1894), Russian composer and one of the greatest pianists of the 19th century, was born at Vykhvatintsy, Podolia province, on Nov. 28 (new style; 16, old style), 1829. In 1835 his father opened a small factory in Moscow and there in the same year his brother NIKOLAI (d. Paris, 1881) was born. Both boys were taught the piano, first by their mother and then by Alexander Villoing. Anton gave his first public recital in Moscow in 1839, and the following year Villoing took him abroad for a three-year concert tour. He appeared in Paris, London, Holland, Germany, and Sweden, attracting the attention of Chopin and Liszt. From 1844 to 1846 he and his brother studied music theory in Berlin with Siegfried Dehn. Anton spent two more years abroad alone, mainly in Vienna, studying the piano and composition. On his return to Russia in 1849 he settled in St. Petersburg where, in 1852, his first opera, *Dimitri Donskoi,* was produced; *Fomka the Fool* appeared the following year, and his *The Siberian Huntsmen* at Weimar in 1854. The original form of his once popular Second Symphony, *The Ocean,* came a little later. The years 1854–58 were spent abroad. Under the patronage of the Grand Duchess Elena Pavlovna, Rubinstein in 1859 founded the Russian Music Society, and later became conductor of its orchestral concerts; in 1862 he founded and became the director of the Petersburg Conservatory, and in 1866 his brother founded the Moscow Conservatory. Rubinstein resigned the conservatory directorship in 1867, but resumed it in 1887 and continued to hold the post until 1891. From 1871 to 1872 he directed the Vienna Philharmonic concerts, and the next year toured the United States with Henryk Wieniawski. His operas include *The Demon* (St. Petersburg, 1875), *The Maccabees* (Berlin, 1875), and *The Merchant Kalashnikov* (St. Petersburg, 1880). He wrote six symphonies, the oratorio *The Tower of Babel* (Königsberg, 1870), five piano concertos, songs, piano pieces, and numerous chamber works.

THE BETTMANN ARCHIVE

RUBINSTEIN

In 1889 Rubinstein published an autobiography, translated by A. Delano as *Autobiography of Anton Rubinstein* (1890), followed by other writings. He died at Peterhof on Nov. 20 (N.S.; 8, O.S.), 1894.

RUBLEV, ANDREI (*c.* 1370–1430), one of the greatest Russian painters, whose most famous work is the icon of the Old Testament Trinity (*see* RUSSIAN ART). Little is known of his life save that he was the pupil of another great painter called Theophanes, a Greek who came to Russia from Constantinople, and that, fairly late in life, he became a monk at the Andronikov monastery in Moscow. Russian painters did not sign their works until the 17th century, so paintings can be assigned to Rublev on the basis only of written evidence or of style.

Written evidence associates with his name wall paintings at Vladimir and Moscow and the panel, or icon, of the Old Testament Trinity; and by analogy of style a number of other icons can also be attributed to him. The chief of these are panels of St. John the Baptist, St. Paul, St. Peter and the Ascension, done in 1408 for the cathedral of the Dormition of the Virgin at Vladimir, and others of the archangel Michael and the Saviour from Zvenigorod, now in the Tretyakov gallery at Moscow. Icons of St. Paul, the archangel Gabriel, the Presentation, the Washing of the Feet and the Last Supper, from the Monastery of the Trinity and St. Sergius at Zagorsk are also probably to be assigned to him, though the attribution is not accepted by all authorities. A copy of the icon Our Lady of Vladimir in the Tretyakov gallery has also been assigned to Rublev, and he is supposed to have painted in 1408 an icon of the Ascension in association with Daniel Chorny.

Rublev was trained wholly in the Byzantine tradition, in which the spiritual essence of art was regarded as more important than naturalistic representation. The very hieratical character of the mid-Byzantine style had, with the 14th century, given way in Constantinople to a more intimate, humanistic approach, but to this Rublev was able to add an element which was truly Russian, that of a complete unworldliness, and it is this which distinguishes his work from that of his Byzantine predecessors. Nor was any later Russian painter ever quite able to equal Rublev either in his handling or in the interpretation of his subject.

Lazarev, *Andrei Rublev,* in Russian (1960); also "La Trinité d'André Roublev," in *Gazette des Beaux Arts,* 54:289–300 (1959); W. Weidle, *Les Icones byzantines et russes* (1960). (D. T. RI.)

RUBRICS, directions for the conduct of divine service, inserted in service books at the beginning and in the course of the text and properly written or printed in red to distinguish them; hence, in popular speech, the text itself. The word comes from the Latin *rubrica* (from *ruber,* "red"), which originally meant the red earth used for colouring. Subsequently *rubrica* was applied to the red titles under which the Roman jurists arranged the laws and thence to the laws themselves. The practice of the lawyers was adapted by the Christian Church. In the earlier Christian centuries, local practices were commonly transmitted orally, and early medieval service books normally contain few rubrics. In the Latin West, however, from the 9th century onward, there was a class of compilation called *ordines* (*ordinaria, ordinales libri*), reference books which supply information about liturgical practice at Rome as the model for other churches. (*See* ORDINES ROMANI.)

In the 15th and 16th centuries liturgical scholars, following in a tradition already established by the great liturgical treatises *De sancto altaris mysterio* of Pope Innocent III and *Rationale divinorum officiorum* (*c.* 1286–91) of Guillaume Durand, began, with papal approbation, systematically to edit the rubrics of the missal, the breviary (*qq.v.*), and the ritual.

In 1485 A. P. Piccolomini and J. Burchard published their *Pontificale,* giving the ordinary and ceremonies of the pontifical mass. Burchard followed this in 1502 with his *Ordo missae,* giving the general directions of the Roman Mass. In 1539 the *Directorium divinorum officiorum* was published by Lodovico Ciconialano. Finally, the *Rituale romanum* (*q.v.*) was published by order of Paul V in 1614. As a result of this codification, standardized rubrics appeared in the service books. The institution of the Sacred Congregation of Rites in 1587 supplied the Roman Catholic Church with a central interpreting authority for liturgical matters. The convention of writing or printing rubrics in red has long been observed by the Greek Orthodox Church. The service books of the Reformed churches, in whose worship ritual plays only a small part, have few rubrics. In early editions of the

Anglican Book of Common Prayer the rubrics were printed in black italic (in roman when a black-letter type was employed) but some modern editions have them in red. The so-called "black rubric" at the end of the communion service, denying the corporal presence of Christ in the Eucharist, is a 19th-century misnomer for a doctrinal declaration, which is not technically a rubric at all.
(GD. B.)

RUBRUQUIS (or RUBROUCK), **WILLIAM OF** (*c.* 1215–1295; *fl.* 1253–55), Franciscan friar and the author of the best eyewitness account of the Mongol realm written by a medieval Christian traveler, was a contemporary of Roger Bacon who cited him frequently in his *Opus majus*. The date and place of Friar William's birth are not known, but it has been shown that he probably came from the village of Rubrouck which lies about 8 mi. NE of Saint-Omer, France. There is no justification for the identification of his name of origin with Ruysbroeck (now Ruisbroek) in Brabant.

Though Friar William went to the Mongol Empire (Tartary) under order from Louis IX (St. Louis) in 1253, on every occasion, beginning with a sermon delivered at Hagia Sophia on Palm Sunday 1253, he denied that he was on a formal mission from the French king. This was undoubtedly because Louis's earlier envoy to Tartary (*see* ANDREW of Lonjumel) had returned bearing from the Mongol regent-mother a letter couched in terms so arrogant that the king regretted having dispatched a formal embassy. Nevertheless on learning, shortly after Friar Andrew's return, that Prince Sartak, the eldest son of Batu Khan (the Mongolian ruler on the Volga River), was a baptized Christian, Louis IX was moved to communicate with him and he appears to have chosen Friar William to lead an informal mission. The first date given by the friar is that of his sermon at Constantinople (April 13, 1253) but it is generally agreed that he received his commission at Acre where Louis resided between May 1252 and June 1253. At Constantinople he received letters to some of the Tartar chiefs from Baldwin II (de Courtenay), the last emperor of the Latin dynasty.

On May 7, 1253, Friar William and his party embarked at Constantinople and reached Soldaia (Sudak) on the Crimean coast two weeks later. There they secured oxen and carts for their long trek across the steppes to the encampment or *ordu* of Batu Khan, whom they reached when he was near the northernmost point of his summer marches (*i.e.*, about Ukek or Uvyek near Saratov). They marched with him five weeks down the Volga before he ordered them to proceed to the court of the Great Khan in the vicinity of Karakorum. This order involved an outward journey of about 5,000 mi. and an even longer return journey. So enormous a distance was not easy for "a very heavy man [*ponderosus valde*]" like Friar William. The Christians began their long journey on horseback on Sept. 16, 1253. Their route lay north of the Caspian and Aral seas to the Talas River which they reached on Nov. 8. They continued to Cailac Valley (possibly Kayalik near Kapal) where they remained 12 days. Setting out again on Nov. 30 they proceeded by way of the Ebi-nor depression to the great plains of Mongolia and came upon the Great Khan's camp at a locality about ten days' journey to the south of Karakorum (Dec. 27). There they found Nestorian priests.

Friar William and his companions were received courteously by Mangu Khan and remained with him until he ordered them to return to their own country (about May 26, 1254). They left his *ordu* about July 10 and set out once more for that of Batu Khan which they reached about Sept. 16. They followed a more northerly route than on their outward journey. About Nov. 1 they proceeded to the "Iron Gate" or defile at Derbent because the Black Sea route was closed in winter. They spent Christmas Day 1254 at Nakhichevan near Mt. Ararat. The rest of the homeward journey took nearly eight months; they traveled by way of Erzincan, Sivas, Iconium (Konya), Lajazzo, Cyprus, and Antioch (Antakya). They reached Tripoli on Aug. 15, 1255, and found that King Louis had returned to France the previous year. So Friar William wrote of his Mongolian experiences to the French king. His narrative is free from legend and shows him to have been an intelligent and honest observer. Roger Bacon, a brother Franciscan, made great use of Friar William's account in the geographical section of his own *Opus majus*. Nothing is known about the later history of Friar William save that he was alive when Marco Polo returned from the East in 1295.

After Roger Bacon's copious use of it, the narrative of Friar William was neglected, though five manuscripts survive. The chief of these are: (1) Corpus Christi College, Cambridge No. 66 (folios 67 v–110 v) of about 1320; (2) Corpus Christi College, Cambridge No. 181 (folios 321–398) of about 1270–90; (3) Leiden University Library, No. 77 (folios 160 r.–190 r.) of about 1290. The narrative did not appear in the *Speculum Historiale* of Vincent de Beauvais which pays so much attention to intercourse between Western Christendom and Tartary in the 13th century. It was first printed imperfectly by Richard Hakluyt (1598 and 1599).

See W. W. Rockhill (ed.), *The Journey of William of Rubruck to the Eastern Parts of the World, 1253–55, as Narrated by Himself, With Two Accounts of the Earlier Journey of John of Pian de Carpini*, Hakluyt Society (1900); C. R. Beazley (ed.), *The Texts and Versions of John de Plano Carpini and William de Rubruquis*, Hakluyt Society (1903).

RUBTSOVSK, a town of the Altayskiy (Altai) *kray*, Russian Soviet Federated Socialist Republic, U.S.S.R., stands on the Aley River, and on the Turksib railway from Barnaul to Semipalatinsk. Pop. (1959) 111,357. It is the centre of an important region of nonferrous ore mining. The town has a large agricultural machinery industry, producing chiefly diesel tractors and electrical equipment for tractors; also flour mills and other food-processing factories. There is a branch of the Altay Institute of Agricultural Engineering.
(R. A. F.)

RUBY, a valued gem stone, is a red transparent variety of corundum, or alumina (Al_2O_3). It is named from the Latin *rubeus* ("red"). It is sometimes termed oriental ruby to distinguish it from the spinel (*q.v.*) ruby, which is a stone of inferior hardness, density, and value. The blue variety of corundum is sapphire (*q.v.*).

The ruby crystallizes in the rhombohedral system (*see* CORUNDUM); the crystals have no true cleavage, but tend to break along certain gliding planes. The colour varies from deep cochineal to pale rose-red, in some cases with a tinge of purple; the most valued tint is called pigeon's-blood. The ruby is a mineral of very limited distribution. Its most famous localities are in Upper Burma, principally in the neighbourhood of Mogok (*q.v.*), about 90 mi. (45 km.) NNE of Mandalay, where it was mined for many years. It occurs in ruby-bearing earth and in bands of a crystalline limestone, associated with granitic and gneissose rocks, some of which are highly basic; the limestone also contains spinel, garnet, graphite, wollastonite, scapolite, feldspar, mica, pyrrhotite, and other minerals. It also is found in India, Cambodia, Ceylon, Thailand, Afghanistan, and Tanganyika (Tanzania). Specimens have been reported from many places in the United States including North Carolina, Georgia, and Montana. The ruby, like other kinds of corundum, suffers alteration under certain conditions, and passes by hydration into gibbsite and diaspore, which by further alteration and union with silica, etc., may yield margarite, vermiculite, chlorite, and other hydrous silicates.

Rubies and sapphires have been produced artificially with success. It was once the practice to make "reconstructed rubies" by fusing together small fragments of the natural stone; but this process gave way to the Verneuil method of forming artificial ruby from purified ammonium alum and chromium sulfate (*see* GEM: *Synthetic Gems*). The synthetic ruby possesses the physical characters of the natural stone, but may generally be distinguished from it by microscopic bubbles and striae.

See also entries under "Ruby" in the Index.

RUDAKI (ABU ABDILLAH JA'FAR IBN MOHAMMED) (*c.* 859–941), though not the first poet to write in Persian is deservedly regarded as the "father of Persian poetry," and is still admired for the skill and freshness of his verse. He was also a talented singer and instrumentalist. He was born at Rudak near Samarkand, and served as court poet to the Samanid ruler Nasr ibn Ahmad (913–943) at Bukhara. Some writers claim that he was blind from

birth, but this story is belied by the vivid descriptions of nature in his poetry.

His work is marked by an optimism that contrasts with the pessimistic tendencies of most of his successors. Of the enormous literary output attributed to him, fewer than 1,000 couplets have survived, scattered through many anthologies and biographical works, while of his most important work, the first Persian translation of the Indian *Panchatantra* (fables), only 88 couplets remain.

BIBLIOGRAPHY.—All extant verses by Rudaki are in vol. 3 of Sa'id Nafisi's biography *Ahval va ash'ar . . . Rudaki* (1940); German trans. of some by H. Ethé in "Rudagi der Samanidendichter," in *Nachrichten von der Gesellschaft der Wissenschaften Göttingen* (1873). *See* also E. G. Browne, *A Literary History of Persia*, vol. i (1928); H. Massé in *Encyclopaedia of Islam*, vol. 3 (1936). (L. P. E.-S.)

RUDDER, that part of the steering apparatus of a boat or ship which is fastened outside the hull, usually at the stern. The most common form consists of a nearly flat, smooth surface of wood or metal hinged at its forward edge to the sternpost. It operates on the principle of unequal water pressures. When the rudder is turned so that one side is more exposed to the force of the water flowing past it than the other side, the stern will be thrust way and the ship will swerve from its original course. In small craft the rudder is operated manually by a handle termed a tiller or helm. In larger vessels the rudder is turned by hydraulic, steam, or electrical machinery.

The earliest type of rudder was a paddle or an oar used to pry or row the stern of the craft around. The next development was to fasten a steering oar, in a semivertical position, to the vessel's side near the stern. This arrangement was improved by increasing the width of the blade and attaching a tiller to the upper part of the handle. Ancient Greek and Roman vessels frequently used two sets of these steering paddles. Rudders fastened to the vessel's sternpost did not come into general use until after the time of William the Conqueror. In ships having two or more screw propellers, rudders are fitted sometimes directly behind each screw.

Special types of rudders use various shapes to obtain greater effectiveness in maneuvering. The balanced rudder and the semi-balanced rudder are shaped so that the force of the water flowing by the rudder will be balanced or partially balanced on either side of its turning axis, thus easing the pressure on the steering mechanism or the helmsman. The lifting rudder is designed with a curvature along its lower edge which will lift the rudder out of danger should it strike an object or the bottom. The Kitchin reversing rudder has two semicircular blades just behind the propeller which can be adjusted to positions at various angles to the screw current and thus change the direction of its thrust; the blades can also be closed together to form a cup which catches and reverses the direction of the screw current, causing the vessel to go astern. (M. H. I.)

(A) BALANCED RUDDER; (B) SEMI-BALANCED RUDDER

RUDE, FRANÇOIS (1784–1855), French romantic-realist sculptor, was born in Dijon on Jan. 4, 1784. After the death of his father, whom he had assisted in his metalworker's shop, he went to Paris determined to perfect himself in the art of sculpture. He won the Prix de Rome in 1812, but could not go to Rome because of the condition of Europe. He was an enthusiastic Bonapartist.

The attention of the public was first attracted to Rude by the Mercury attaching his winged sandals (1828; Louvre). This shows his training as a neoclassicist, but Rude was obviously uncomfortable within the restrictions of the classical canon and might be called rather a romantic-realist. In his Neapolitan fisher-boy playing with a tortoise (1833; Louvre) the unusual pose and the open mouth both break with tradition. In the statue of Marshal Ney in the Avenue de l'Observatoire in Paris, the hand with the sword raised above the head and the open mouth again violated neoclassic principles. The group of "Volunteers" (for the revolutionary campaign of 1792) on the Arc de Triomphe, although classical in detail, is romantic and impetuous in feeling. The reclining figure of Bonaparte (1847) at Fixin near Dijon (plaster cast in the Louvre), where he is represented as reclining on a rock awakening from sleep and shaking off his campaign cloak, is a famous failure. Toward the end of his life Rude returned to his early classical style. He died in Paris on Nov. 3, 1855.

See J. Calmette, *François Rude* (1920). (A. K. McC.)

RUDINI, ANTONIO STARABBA, MARCHESE DI (1839–1908), Italian statesman, twice premier of Italy, was born at Palermo, Sicily, on April 16, 1839, of an aristocratic Sicilian family that had long resented being ruled by the Neapolitan Bourbons. He was involved in the revolution which broke out against Naples in April 1860, but fled the country before Giuseppe Garibaldi (*q.v.*) arrived with his "Thousand" to support this revolt. After the Piedmontese annexation of Sicily he was for a time an attaché with the Italian Foreign Office at Turin. Then in 1864, while still only 25, he was appointed mayor of Palermo. In this position he showed great bravery during a rebellion which took place in September 1866. Considerable feeling had grown up in Sicily against the new government of Italy, and the mayor was even besieged for a week in the town hall. He was then promoted to prefect, with the task of putting down brigandage in the west of Sicily. In 1869, though not yet a deputy, he was for a month minister of the interior. On the death of Marco Minghetti in 1886 he became leader of the parliamentary right wing, and in 1891 he succeeded Francesco Crispi as premier (for one year). It was remarkable that he chose to form a coalition with Giovanni Nicotera of the left.

The crisis consequent upon the military disaster of Aduwa in Ethiopia (March 1896) brought Rudini back again to power as premier and minister of the interior. He concluded peace with Ethiopia, and to satisfy the anti-colonial party he ceded Kassala to Great Britain, thus provoking much indignation in Italy. At home his policy was not sufficiently elastic to avoid serious rioting which broke out in 1898; nor was he sufficiently forceful in putting down an incipient Socialist revolution. So he fell from power in June. He died in Rome on Aug. 7, 1908. (D. M. SH.)

RUDOLF, Holy Roman emperor: *see* RUDOLF, German kings.

RUDOLF, the name of three German kings, the first of whom was merely an antiking and the last not only king but Holy Roman emperor.

RUDOLF OF RHEINFELDEN (d. 1080), antiking from 1077, was a son of Kuno, count of Rheinfelden (on the upper Rhine east of Basel), who held lands both in the Kingdom of Burgundy and in neighbouring Swabia. The dowager empress, Agnes of Poitou, regent for her infant son Henry IV (*q.v.*), enfiefed Rudolf with the duchy of Swabia (1057) and made him administrator of the Kingdom of Burgundy. She also gave him her daughter Matilda in marriage (1059), but Matilda died in 1060. Rudolf, whose second wife, Adelaide of Turin, was sister of Henry IV's first wife, Bertha, at first supported his brother-in-law. In 1076, however, when Pope Gregory VII excommunicated Henry and proclaimed him deposed, Rudolf turned against the king. Promising to respect the elective character of the monarchy and to renounce any royal right to the investiture (*q.v.*) of prelates, he was elected king by an assembly of dissident princes at Forchheim on March 13, 1077, and crowned at Mainz on March 26. Unable to win support in Swabia, he joined forces with the Saxons and fought against Henry at Mellrichstadt in Franconia (Aug. 7, 1078) and, more successfully, at Flarchheim in Thuringia (Jan. 27, 1080). Recognized at last as king by the pope at the Lenten synod, he won a victory over Henry on the Elster River on Oct. 15, 1080, but received a wound of which he died next day. He was buried at Merseburg. (X.)

RUDOLF I (1218–1291), German king from 1273, was born at Limburg-im-Breisgau on May 1, 1218, the son of Albert IV, count of Habsburg, and Heilwic of Kyburg. At his father's death (*c.*

1239) he inherited lands in upper Alsace, the Aargau, and the Breisgau, which formed a transit point for the increasing flow of commercial traffic through the St. Gotthard pass over the Alps. A partisan of the Hohenstaufen emperor Frederick II and his son Conrad IV, he increased his territories largely at the expense of his uncle, Count Hartmann of Kyburg, and his cousin, Count Hartmann the Younger, who supported the papal cause against the Hohenstaufens; and his first marriage (*c.* 1245), to Gertrude of Zollern-Hohenberg-Haigerloch (d. 1281), also added to his domains.

Rudolf's election as German king, at Frankfurt on Oct. 1, 1273, was precipitated by the desire of the electors to exclude an excessively powerful rival candidate of non-German birth, Otakar II (*q.v.*) of Bohemia. Crowned at Aachen on Oct. 24, 1273, he was recognized by Pope Gregory X on Sept. 26, 1274, on his promise to renounce all imperial rights in Rome, in the papal territories, and in Sicily, and to lead a new crusade. The pope also persuaded Alfonso X of Castile, who had been chosen German king in 1257, to abandon his claim in 1275. Rudolf broke the Bohemian opposition on Aug. 26, 1278, at the Battle of Dürnkrut, where Otakar II was slain. By granting the duchies of Austria and Styria, former Bohemian possessions, to his sons Albert and Rudolf (Dec. 21, 1282), Rudolf I constituted the territorial nucleus of the later Habsburg power (*see* AUSTRIA, EMPIRE OF; HABSBURG).

Rudolf made great efforts, in concert with the territorial princes, to enforce the public peace (*Landfriede*) in Germany; and in 1274 he reasserted the right of the monarchy to impose taxation on the cities. But his attempt to reconstitute the duchy of Swabia came to nothing after the death, in 1290, of his younger son Rudolf, to whom he had granted it as an appanage; and his attempt, in 1290, to install his elder son Albert on the Hungarian throne was frustrated.

Rudolf combated the expansionist policy of the French kings Philip III and Philip IV on his western frontier by marrying Isabella, daughter of Hugh IV, duke of Burgundy (Feb. 5, 1284), and by compelling Otto IV, count of Burgundy, to do homage (1289). But French influence at the papal court prevented his being crowned as Holy Roman emperor by the pope in Rome. Rudolf was likewise unsuccessful in his repeated efforts, between 1287 and 1291, to secure the election of his son Albert as German king or king of the Romans, since the German electors were determined that the crown should not become a hereditary possession of the powerful house of Habsburg. Thus the electors' freedom of action remained intact when Rudolf died, at Speyer, on July 15, 1291. (C. C. BA.)

RUDOLF II (1552–1612), Holy Roman emperor from 1576, was born in Vienna on July 18, 1552, as the eldest surviving son of the emperor Maximilian II and Maria, daughter of the emperor Charles V. He was educated in Spain from 1563 to 1571. Crowned king of Hungary on Sept. 26, 1572, and of Bohemia on Sept. 22, 1575, he was elected king of the Romans, or German king, on Oct. 25, 1575, and succeeded his father as emperor on Oct. 12, 1576. He then inherited all Maximilian's patrimonial lands; and to these he added the Tirol and other territories on the death of his uncle, the archduke Ferdinand, in 1595.

Rudolf was subject to fits of morbid depression, and soon retired to Prague, where he lived in greater and greater seclusion. He was much interested in chemistry, medicine, astronomy, astrology, and alchemy, became the patron of Tycho Brahe and Kepler and of all the arts, and himself dabbled in many sciences and arts; his collection of rare works of art was the greatest of the age. He never married, but had several illegitimate children.

During the first 20 years of Rudolf's rule, the institutions of the *Reich* ceased to function because of disputes between Catholics and Protestants, though Rudolf exerted considerable influence on the infrequent *Reichstage* (imperial Diets) by consistently supporting the Catholic viewpoint. He promoted unsuccessful negotiations between Spain and the Netherlands in 1579 and was at first on poor terms with Spain and occasionally suspicious of papal policy. In Austria he reversed Maximilian II's tolerant religious policy and sought to limit the political privileges of the Protestant Estates (the nobles and representatives of the towns). Revolts of the Austrian peasants were suppressed (1594–97), but the Protestants and the Estates of all Rudolf's lands benefited from his financial difficulties, which were increased after 1593 by the renewal of war against the Turks.

Rudolf's mental illness grew worse after 1598, impairing his willpower and aggravating his violent and suspicious nature; he evaded political decisions and relied on the advice of his personal servants. Attacks on religious and political privileges in Rudolf's lands were intensified after 1600, and Hungary revolted in 1604 under István Bocskay, who allied himself with the Turks.

The Habsburg archdukes, long discontented with Rudolf's political incompetence and failure to provide for the succession, compelled him in 1605 to entrust the conduct of Hungarian affairs to his brother Matthias (*q.v.*); and in April 1606 they recognized Matthias as their head and as their candidate for Rudolf's succession. Rudolf spent the rest of his life seeking vengeance on Matthias. Disliking the treaties made by Matthias with the Hungarians and with the Turks in 1606, he prepared to renew the war, but Matthias allied himself with the Estates of Hungary, Austria, and Moravia, and forced Rudolf to cede these lands to him in June 1608 and to promise him the succession in Bohemia. Rudolf unsuccessfully sought the assistance of the German princes and even of the Protestants, toward whom he occasionally expressed a more tolerant attitude in his last years. In July 1609 the Bohemian Estates compelled him to grant them religious freedom and political privileges in the *Majestätsbrief* (Letter of Majesty); and similar concessions were made in Silesia and Lusatia.

The *Reichstag* had collapsed in 1608, the religious parties of Germany formed rival leagues, and Rudolf's troops were expelled from Jülich (*q.v.*), where he had intervened in the dispute over the Cleves-Jülich-Berg inheritance. In 1611, when mutinous imperial troops under the archduke Leopold ravaged Bohemia with Rudolf's support, the Bohemian Estates sought help from Matthias, whose army virtually held Rudolf prisoner in Prague till he abdicated Bohemia to Matthias in May. Rudolf, however, prevented Matthias' election as king of the Romans, or successor designate to the Empire.

Rudolf died in Prague on Jan. 20, 1612. He had greater political acumen than Matthias, who eventually succeeded him as emperor; but illness and unpopularity weakened him in their conflict and prevented him from restraining the religious dissensions of his lands and the Empire which were to lead to the Thirty Years' War. (H. J. Co.)

RUDOLF (1858–1889), Austrian archduke and crown prince, concerning whose death there has been lasting speculation. He was born at Laxenburg, near Vienna, on Aug. 21, 1858, the only son of the emperor Francis Joseph (*q.v.*) and the empress Elizabeth. Heir to the throne, he received an extensive education and traveled widely. Politically, his anxiety to overcome the problem of the various nationalities of the Habsburg monarchy and his antipathy to Russian imperialism were combined with liberal and anticlerical views which alienated him from his father and from the prime minister, Eduard, Graf von Taaffe (*q.v.*). The emperor excluded him from the business of government and arranged his marriage (May 10, 1881) to Stephanie, daughter of Leopold II of the Belgians. She bore him a daughter, Elizabeth Marie, in 1883.

Rudolf in October 1881 came under the influence of a journalist, Moritz Szeps, to whose radical paper, the *Neues Wiener Tagblatt*, he contributed anonymous articles. He also published two books on his travels and sponsored a monumental survey of Austria-Hungary. At the same time he entertained schemes for having himself crowned king of Hungary and for resuscitating a Kingdom of Poland. Frustrated in his designs and unassuaged by transient amours, he fell into morbid despondency. The actress Mitzi

Kaspar, his mistress from 1887, declined his offer of a suicide pact in December 1888; but the baroness Mary Vetsera, an infatuated girl of 17 with whom he had begun relations only in October, accepted it. In the morning of Jan. 30, 1889, he and Mary were found shot dead in his bedroom in the hunting lodge at Mayerling. Maladroit attempts by the emperor and his advisers to disguise the facts provoked innumerable rumours; enemies of the Habsburg court added false interpretations; and romantic writers have battened on the stories. Apart from mental derangement, the most plausible explanation of Rudolf's act is that he believed that his dealings with the Hungarian opposition were about to be exposed.

BIBLIOGRAPHY.—*Das Mayerling-Original* (1955), published by the Vienna Police Directorate, gives the material of the official enquiry into the suicide. *See* further K. Lónyay, *Rudolf* (1950); R. Barkeley, *The Road to Mayerling* (1958).

RUDOLF, LAKE, is remotely situated in northern Kenya, but almost the entire northern shore lies north of the unratified boundary with Ethiopia. The physical setting of the lake comprises the low plateaus between the Kenya Highlands and the Ethiopian Highlands where Rift Valley structures give place to a downwarped surface in which faulting, though not entirely absent, is less in evidence. (*See* also KENYA: *Physical Geography.*) In the east and south the Tertiary and Quaternary volcanics give rise to rocky shores, while the lower western and northern shores, developed in Quaternary sediments, present sand dunes, sandspits, and mud flats. The three main islands, North, Central, and South, are volcanic. The lake is long and narrow (length 154 mi. [248 km.]; width varying from 10 to 20 mi.) and it has an area of 2,743 sq.mi. (7,104 sq.km.) (1958). Its surface is 1,230 ft. (375 m.) above sea level, and the greatest recorded depth is 240 ft. (73 m.), although the height of the lake and consequently its size tend to fluctuate.

At the mid-Pleistocene maximum there was an overflow northwestward to the Nile Valley; but Lake Rudolf is now situated in an inland drainage basin and its waters, though drinkable, are rendered brackish by their high soda content. The only perennial affluent is the Omo River from the Ethiopian Highlands; the Turkwel and the Kerio flow across the Turkana plains to make their intermittent contribution.

The climate of the lake and its adjacent lands is hot and, except in the extreme north, arid; and a persistent, sand-laden wind from the southeast adds to the discomfort. Sudden storms give the lake its treacherous reputation. In its waters abound huge Nile perch and various species of the carplike *tilapia.* Crocodiles are ubiquitous; the hippopotamus occurs less frequently; and migrant and local waterbirds are found on the shores. On the various delta fans a little sorghum millet is cultivated. The nomadic pastoralists of the neighbouring desert scrub, Nilo-Hamitic Turkana and Samburu on the west and south respectively, and various Hamitic-speaking groups on the east, have in the past shown little interest in the lake or in fishing.

Count Samuel Teleki and Lieut. Ludwig von Höhnel visited the lake in 1888 and named it Rudolf, after the crown prince of Austria. They approached from Lake Baringo, but the road route is now from Kitale via the administrative stations of Lodwar and Lokitaung in the Turkana district.

RUDOLF VON EMS (*c.* 1200–*c.* 1254), probably the most prolific and versatile poet in Middle High German literature. Between about 1220 and 1254 he wrote five epic poems, totaling over 93,000 lines, still extant. Research has been unable to establish most of the facts of Rudolf's life on a basis firmer than that of conjecture, but he was probably born at Hohenems, near the Lake of Constance. Though influenced by Hartmann von Aue and Gottfried von Strassburg (*qq.v.*), his works show considerable originality. His earliest poem, *Der guote Gêrhart,* is the story of a Cologne merchant who, despite his unaristocratic calling, has all the courtly qualities of an Arthurian knight. His charity and humility result in his being offered the crown of England, and in his rejection of the offer. The charm and realism of this poem are not equaled in Rudolf's other works, *Barlaam und Josaphat, Alexander, Willehalm von Orlens,* and the *Weltchronik.* The popularity of his writings can be gauged by the fact that there are over 80 extant manuscripts and manuscript fragments of the *Weltchronik* alone.

RUDOLPH (RAOUL) (d. 936), duke of Burgundy, king of France from 923 to 936, was the son of Duke Richard, called le Justicier. Son-in-law of King Robert I (922–923), with whom he had rebelled (922) against the Carolingian Charles III the Simple, Rudolph was elected king by the magnates (July 13, 923) a month after Robert's death in battle. Rudolph's reign was little more than an unending series of battles, and he was at first recognized by only a few of the magnates. His troubles included attacks by the Normans (924–926), the loss of Lorraine (925) to the German king Henry I the Fowler, and a rebellion in Aquitaine (926). Meanwhile Count Herbert of Vermandois, who had captured Charles (late 923), extracted the county of Laon from Rudolph (928) by threatening to release the Carolingian. After Charles's death (929) Rudolph's position improved; his defeat of the Normans in the Limousin regained him the allegiance of Aquitaine, and by 935 he was acknowledged king throughout France. But he died on Jan. 14 or 15, 936.

See P. Lauer, *Robert Ier et Raoul de Bourgogne, rois de France* (1910), (ed.) *Les Annales de Flodoard* (1905). (J. DE.)

RUDOLSTADT, a town of East Germany in the *Bezirk* (district) of Gera, German Democratic Republic, is on the left bank of the Saale, 8 mi. (13 km.) N of Saalfeld and 23½ mi. (38 km.) SW of Jena by road. Pop. (1964) 30,087. The name of "Rudolfestat" occurs in an early 9th-century inventory of the possessions of the abbey of Hersfeld. It came into the hands of the counts of Schwarzburg-Blankenburg in 1334. From 1574 to 1918 it was the residence of the ruling house of Schwarzburg-Rudolstadt, their former seat being Schloss Heidecksburg on the wooded Hainberg above the Saale, rebuilt in Rococo style after a fire of 1735. It is now a museum. Schloss Ludwigsburg, built in 1734, their former temporary seat, is now a music school. The town is a tourist resort and has a theatre. Industries include the manufacture of porcelain, glass, chemicals, and hardware.

RUDRA, a minor god of Vedic India who doubtless personified lightning (the "red" one, probably), but also protected cattle against it. In the Rig Veda he is identified with Agni (*q.v.*), but in the later Vedas he is called an archer and his malevolence is emphasized. In the later literature also he is said to have had as spouse (or sister) Ambika, one of the names of the mother goddess Shakti. Best known as father of the storm-gods (Maruts), in the Epic period he becomes many Rudras and in modern Hinduism is identified with Shiva.

RUE, the name of a woody or bushy herb, belonging to the genus *Ruta* (family Rutaceae), especially *R. graveolens,* the common rue, a plant with bluish-green spotted leaves and greenish-yellow flowers, native to Europe and sparingly naturalized in eastern North America. It has a strong pungent smell and the leaves have a bitter taste. The plant was much used in medieval and later times as a stimulative and irritant drug. It was commonly supposed to be widely used by witches. From its association with "rue" (sorrow, repentance), the plant was also known as "herb of grace" and was taken as the symbol of repentance.

RUEDA, LOPE DE (*c.* 1510–1565), Spanish actor-manager and playwright, an important figure in the development of Spanish drama (*see* SPANISH LITERATURE: *The Renaissance and the Siglo de Oro: Early Drama*). Born at Seville, he became a goldbeater, and, later, an actor, and toured Spain with his own company of players. He is mentioned as an actor-manager chosen to perform before Philip II at Benavente in 1554, and in 1564 was at Seville,

where his plays may have been seen by Cervantes, who praises him as a talented actor of stock comic parts, an outstanding writer of pastoral verse, and the dominant figure of early Spanish drama. He died at Córdoba in 1565.

Rueda's most important contribution to Spanish drama was his creation of the *paso*, a short one-act play or interlude, based on an incident from everyday life (*e.g.*, a quarrel between husband and wife), and written in a free, naturalistic dialogue, reflecting the tone and idiom of popular speech. He also wrote four short prose comedias (*Medora, Armelina, Eufemia, Los Engañados*) and two dramatic dialogues (*Coloquio de Camila* and *Coloquio de Tymbria*). The plots of these, chiefly on themes of accidental separation and joyful reunion, are taken from Italian comedy, and make much use of implausible vicissitudes and coincidences. They are notable, however, for their lively minor comic characters and comic scenes.

BIBLIOGRAPHY.—Rueda's plays were first published in 1567. His *Obras* were ed. by E. Cotarelo y Mori, 2 vol. (1908); and his *Teatro* (a selection), by J. Moreno Villa (1924). *See* also H. A. Rennert, *The Spanish Stage in the Time of Lope de Vega* (1909; new ed. 1964); E. Cotarelo y Mori, *Lope de Rueda y el teatro español de su tiempo* (1898); M. Bataillon, in the *Bulletin Hispanique,* xxxvii (1935); G. B. Palacin, in the *Hispanic Review,* xx (1952). (L. J. CL.)

RUEIL-MALMAISON, a town of northern France in the *arrondissement* of Saint-Germain-en-Laye, and the former *département* of Seine-et-Oise, 8½ mi. (14 km.) W of Paris. Pop. (1962) 46,515. Originally called Rotalajum, a pleasure resort of the Merovingian kings, it was given by Charles the Bald to the Abbey of Saint-Denis in 875, and later it grew by donations of land and the grant of civic rights until it was partly destroyed when Edward III devastated Normandy as far as the outskirts of Paris in 1346. In 1630 Cardinal Richelieu bought an estate there and carried out extensive building. In 1799 Josephine Bonaparte purchased the château and domain of Malmaison ("house of misfortune"). Napoleon liked the place (then called Ruel, and Rueil after 1805) and rested there between campaigns. The decree instituting the order of the Legion of Honour was signed there.

After his defeat in 1815 Napoleon spent a short while at Malmaison and said farewell to his remaining troops. The empress and her daughter, Hortense Beauharnais, are buried at Rueil in the Renaissance chapel, rebuilt by Napoleon III. The château is now a museum. (P. FI.)

RUFF (*Philomachus pugnax*), a shore bird of the family Scolopacidae, taking its name from the frill of elongated feathers round the neck of the breeding male, to which the name is properly confined; the female, a much smaller bird, is termed the reeve. The plumage of the male is extremely variable, but the same markings

ARTHUR CHRISTIANSEN

MALE RUFFS (PHILOMACHUS PUGNAX) IN COURTSHIP DISPLAY

are reproduced after every molt in each individual bird. The ruff ranges across the whole of northern Europe and Asia and migrates south to India, Ceylon, and Africa in winter.

These birds, of no commercial or game value, are of interest because of their remarkable courtship behaviour and mating habits. The ruffs live apart from the reeves throughout most of the year, but as breeding time nears they begin to grow their neck frills and return to ancestral courtship areas in the spring. A group of cocks display on a slightly raised patch in a field; each bird charges about in his own chosen territory, ruffling his frill and shaking his partially extended and drooping wings. When a reeve approaches, the ruffs appear entranced and shiver noticeably; she walks into the area and selects her mate by nipping him. Pairing takes place immediately. The mating behaviour varies from monogamy to polygamy and promiscuity. The female builds the nest and rears the young; the male takes no interest in nesting or in his offspring.

See E. A. Armstrong, *Bird Display and Behaviour* (1947).

RUFFINI, PAOLO (1765–1822), Italian mathematician and physician whose researches on equations contained anticipations of the algebraic theory of groups, is generally regarded as the first to show that general algebraic equations of degree five or higher cannot be solved with radicals.

Born in Valentano, Viterbo, on Sept. 22, 1765, he spent almost his whole life at Modena, having moved there with his father as an infant. He taught at the University of Modena from 1787 to 1798 when he was dismissed by the Cisalpine government because he refused to take the civil oath. In 1799 he was recalled to the university as professor in clinical medicine and applied mathematics and in 1801 became professor in analysis and geometry. Ruffini remained when the university became a secondary school (1802), teaching higher mathematics there. In 1807 he left to teach applied mathematics for the military school at Modena (later the Italian Military Academy), which ceased operation in 1814 with the end of the Napoleonic reign. The ducal University of Modena having been restored, Ruffini was made rector there and again taught clinical medicine and applied mathematics.

For many years president of the Italian Society of Sciences (Society of the Forty), Ruffini was a member of the National Napoleonic Institute. He died at Modena on May 9, 1822.

Ruffini is recognized as the first (1799) to show that the general quintic (or higher) equation cannot be expressed in terms of radicals. His demonstration was criticized by his contemporaries for lack of rigour and it remained for N. H. Abel (*q.v.*) to furnish more conclusive corroboration in 1824. Ruffini's notion that a group need not include a subgroup of an order that arbitrarily divides that of the group is sometimes called Ruffini's theorem. This was fundamental to the work done later by É. Galois and A. L. Cauchy in group theory (*see* FIELDS: *Galois Theory*).

RUFINUS (FLAVIUS RUFINUS) (d. 395), a minister of the Roman emperor Arcadius (*q.v.*), was a native of Gaul. Theodosius I, at his death on Jan. 17, 395, had left Rufinus as Arcadius' chief adviser. He at once became the rival of Stilicho (*q.v.*) and tried to strengthen his position by marrying his only daughter to Arcadius. The match was prevented, however, by the chamberlain, a eunuch called Eutropius, who eventually took Rufinus' place as the emperor's chief minister. When Stilicho landed in Greece to suppress a rising of the Visigoths, he sent some troops, commanded by Gainas, to Constantinople; they murdered Rufinus there on Nov. 27, 395. A posthumous attack on him by the poet Claudianus survives. (E. A. T.)

RUFINUS, TYRANNIUS (*c.* 345–410/411), Christian priest, writer, and translator of Origen, was born at Concordia, near Aquileia, in northern Italy. The son of Christian parents, he studied at Rome, meeting Jerome there. In his 20s he became a monk at Aquileia and was baptized; and since Jerome frequently visited his monastery the two became fast friends. About 373, drawn by his interest in Eastern theology and monasticism, Rufinus journeyed to Egypt, where after a stay with the desert fathers he became the pupil of Didymus the Blind, being fired by him with enthusiasm for Origen. He also became the friend of another devout seeker after perfection, the wealthy Roman widow Melania. In 378 he followed her to Palestine, and while she established a convent for virgins at Jerusalem he with her aid founded one for men nearby. When Jerome settled near Bethlehem in 386, the

friendship between the two men was renewed. At some time during his stay in Jerusalem Rufinus was ordained priest.

Till then his life had been peaceful, but in the early 390s he, with Jerome, became involved in the acrimonious controversy about Origen's teaching, which the strictly orthodox now regarded with suspicion. In 393 both were charged with Origenist leanings, but while Jerome readily made formal abjuration of the errors alleged, Rufinus refused to do so. In 394, when Epiphanius sharply attacked Bishop John of Jerusalem, Rufinus sprang to his defense. A fierce quarrel thus broke out between Rufinus and Jerome. It had been smoothed over by 397, when Rufinus returned to Italy, but flared up with intensified bitterness when he published in Rome a whitewashing Latin translation of Origen's *De principiis* with a preface representing Jerome as an admirer of Origen's. Henceforth he was exposed to merciless abuse from Jerome, and his own orthodoxy was called in question. He even found himself obliged to address a reasoned *Apologia* to Pope Anastasius, who had summoned him to Rome. He was now deeply immersed in literary work, but in 407, shaken perhaps by the barbarian invasions menacing northern Italy, he moved south from Aquileia to Pinetum, near Terracina. Here he continued his studies, but was driven thence when Alaric's hordes invested Rome in 408. Making for Africa, he crossed over to Sicily, and he was there, busily translating Origen's homilies, when he died in 410 or 411, possibly at or near Messina.

As a writer Rufinus did valuable service by translating Greek theological works into Latin in an age when the knowledge of Greek was declining in the West. His translation of Origen's *De principiis* is the only complete text of the work surviving, and he also translated certain of Origen's Bible commentaries and a host of his homilies on Old Testament books. Rufinus' other translations include Pamphilus' *Apologia* for Origen, the *Clementine Recognitions*, eight homilies of Basil and the two versions of his rule, nine homilies by Gregory of Nazianzus, and Eusebius' ecclesiastical history. Often his renderings were loose paraphrases or even shortened adaptations, and in Origen's case he did not hesitate to modify or suppress dubious passages on the theory that they must have been altered or interpolated by unorthodox hands. His original writings include (besides his *Apologia* to Pope Anastasius) a second and more irate *Apologia* against Jerome, two books continuing Eusebius' ecclesiastical history, the *De benedictionibus patriarcharum* (allegorically expounding Gen. 49), and a commentary on the Apostles' Creed. This last is important both as a sample of intelligent contemporary catechetical teaching, and as providing the earliest continuous Latin text of the Western baptismal creed (*see* CREED).

BIBLIOGRAPHY.—Rufinus' original works are in J. P. Migne, *Patrologia Latina*, vol. 21 (1849); a critical edition of his ecclesiastical history is by T. Mommsen in E. Schwartz's edition of Eusebius' church history, vol. 2 (1908); Eng. trans. of his commentary on the Apostles' Creed by J. N. D. Kelly in the "Ancient Christian Writers Series" (1955). Rufinus' translations are in the editions of the relevant Greek authors; a critical edition of the translation of Gregory of Nazianzus' homilies is by A. Engelbrecht, *Corpus scriptorum ecclesiasticorum Latinorum*, vol. 46 (1910). *See* also F. X. Murphy, *Rufinus of Aquileia* (1945).

(J. N. D. K.)

RUFISQUE, a town and port of the Republic of Senegal, about 18 mi. (29 km.) E of the capital, Dakar. It is on the Dakar-Niger railway and is also connected by rail with Saint-Louis; roads follow the same routes. Pop. (1958) 47,000 (comm.). Formerly the Portuguese Rio Fresco, it was of considerable importance in the 14th century as a port, but declined after the development of the port of Dakar. However, its proximity to the capital has stimulated industrial development; products of the town's factories include leather, cement, edible oil, biscuits (cookies), chocolates, and cotton; titanium and zirconium are mined locally. Fishing is important and has given rise to factories for smoking, drying, and canning the catch. Rufisque has three parts: (1) The old town, parallel with the shore, retains the atmosphere of the old colonial towns. The streets, arranged in a grid pattern, are lined with buildings, with wooden balconies on the upper stories and shops below. (2) These European-type houses give way, farther from the front, to the low houses of the African traders. (3) A new modern town, associated with the industrial development, has sprung up along the road to Dakar. The need for labour has also given rise to an increasing number of African villages lining the shore.

(J. D.)

RUG AND CARPET. The term "carpet" was used until the 19th century for any cover made of a thick material, especially a table cover, but now means almost exclusively a floor covering. This article deals only with handmade carpets; in this area, and particularly with reference to Oriental carpets, the terms "carpet" and "rug" are used interchangeably. Carpets may be of felt, tapestry, a shuttle-woven material, or a pile fabric. The last is the most frequent and typical. In the ancient and primitive Orient some kind of covering was necessary, especially on beaten-earth floors. In the West the advantages of a fabric underfoot were recognized, and carpets of some kind or other have been an almost universal adjunct of civilization; in both the East and West their manufacture finally developed into a very large industry. Such floor coverings offer most interesting opportunities for ornamentation, and in the Orient, where both the craft and the art originated, carpet weaving and design attained, over a period of at least 2,500 years, a degree of excellence that warrants ranking the finest specimens with man's most notable artistic achievements.

This article is arranged as follows:

I. Historical Survey
  1. Antiquity and the Middle Ages

  5. Patterns
III. Practical Considerations
  1. Uses of Carpets
  2. Size and Shape
  3. Care of Carpets

For a discussion of methods of making carpet both by hand and by machine *see* CARPET MANUFACTURE. There are also articles on the related topics TAPESTRY and TEXTILES.

I. HISTORICAL SURVEY

1. Antiquity and the Middle Ages.—Felt (*q.v.*) is almost certainly the most ancient form of carpet for it probably originated as bark felt, even as early as the Upper Paleolithic Period, about 25,000–30,000 years ago. Floor coverings of plaited rushes have also been used since very early times. Evidences of basket plaiting appear in the Upper Paleolithic Period, and archaeological finds in Iraq indicate that floor coverings of plaited rushes, such as grew in the Mesopotamian swamps, were used by the 5th or 4th millennium. These rushes made stout, durable, portable mats, and even at an early period they were probably handsomely ornamented, judging from the competence in decorative pattern shown on contemporary painted pottery and on the decorated walls of the Chalcolithic village at Persepolis. The weaving of rush mats in the Middle East had reached a high degree of artistic perfection and prestige by medieval times and has continued there to the present day.

Rug design, in western Asia at least, evolved beyond the limited possibilities of felt and plaited mats long before the 1st millennium B.C.; for example, a threshold rug, represented in a stone carving (now in the Musée du Louvre) from the Assyrian palace of Khorsabad (8th century B.C.), has an allover field pattern of quatrefoils, framed by a lotus border, completed by guard stripes. Other Assyrian carvings of the period also show rich and handsome patterns that have survived in the repertoire of

BY COURTESY OF THE LOUVRE; PHOTOGRAPH BY CHUZEVILLE

DETAIL OF THRESHOLD RUG REPRESENTED IN A STONE CARVING FROM THE ASSYRIAN PALACE OF KHORSABAD, 8TH CENTURY B.C. IN THE LOUVRE

carpets ever since.

By historic times the carpets of the Near East had attained fame and magnificence. Classical authors speak with admiration of the luxurious Babylonian carpets (*see* A. U. Dilley, *Oriental Rugs and Carpets,* 1931, p. 11), and, in the tomb of Cyrus, Alexander the Great found the gold funeral couch resting on carpets of very fine fabric. Both Athenaeus and Xenophon indicate that some of these were thick and resilient, but we cannot be sure whether they were pile woven or made of embroidered felt, though some were evidently gold-enriched. Certain types were reserved for court use, and were so costly that they were important items in the royal treasury. Finds from tombs dating from the 5th to the 3rd century B.C. at Pazyryk in the foothills of the western Altai include various articles of felt with appliqué patterns, and a superb carpet with a woolen pile, said to be knotted with the Ghiordes or Turkish knot. This carpet, probably of Persian origin, is about six feet (about two metres) square. The central field has a quatrefoil pattern reminiscent of the Assyrian stone carvings mentioned above. Of the two wide borders, the inner one shows a frieze of deer, the outer one a frieze of horsemen; there are guard stripes between. The carpet is now in the Hermitage Museum, Leningrad. Fragments of two more carpets of the same type were also found at Pazyryk and are now in the Hermitage.

Some embroidered carpets have been found in tombs of the 1st century B.C. to 1st century A.D. at Noin Ula in northern Mongolia (C. Trever, *Excavations in Northern Mongolia,* 1932); these are also in the Hermitage Museum. A felt example (originally about 6 ft. 5 in. × 8 ft. 6 in.) had the field filled with a spiral meander; a broad border with animal-combat groups (alternately tiger and yak, and griffin and elk) alternating with a tree; an inner guard stripe of geometrical units; and a wide margin of Chinese lozenge-patterned silk. The patterns were executed with quilting (field), and couched cord on a quilted ground (main border; inner guard stripe solid couched cord), and the colours as reconstituted by chemical tests (V. Komonov, Moscow-Leningrad, 1937) were vivid; yellow quilting on a red field; a red border with blue and green figures outlined with white; and green, red, yellow, and blue in varying succession in the guard stripes.

Another piece embroidered in wool on wool in stem and satin stitches was still more complex in organization: on the field, a diagonal lattice defined by scrolling stems, with a cross-treflé at each intersection and a tortoise alternating with a fish in each unit, in blue, purple, and tans on a red ground; a diagonally hatched field margin; beyond, an inner border system, with double guard stripes on both sides; then the main wide border, filled with a concentric lozenge diaper pattern, and with an inner guard stripe; and finally an outer binding of red and brown checked flax and wool material. These pieces are datable by a lacquer bowl found with them which is inscribed with the equivalent of A.D. 3. Some of them are of great beauty; their intricate patterns are clearly delineated and well coordinated.

The Noin Ula finds also include some fragments of pile carpets. They are woven of fine, lustrous, still elastic wool, of deep indigo blue. The pile is very thick and dense, the knots or loops having been firmly compacted, though the strands are merely wrapped round one warp thread, a simple technique that later made its way to Spain. (A. U. Pope, in Pope [ed.], *A Survey of Persian Art,* Oxford, 1938, iii, pp. 2272–73.) This same technique is also used in a number of fragments, assignable to the first three centuries A.D., found by Sir Aurel Stein in Loulan, Niya, and Tung-Huang in Chinese Turkistan (*see* Stein, *Serindia* [1921], Pls. 3, 7, 8; and *Innermost Asia* [1928]). The technique was continued in this region at least into the 7th or 8th century, as is proven by a fragment discovered by A. von Le Coq at Kizil.

By late Sasanian times (6th–7th century A.D.) carpet weaving in Persia had won international prestige, and according to the Sui annals woolen rugs were being exported to distant China (*Sui-šu,* chap. 83; Berthold Laufer, *Sino-Iranica,* 1919, p. 493). The carpets of this period were of several kinds: woolen or silk, either pile or tapestry-woven, embroidered, or even of shuttle-woven silk (*dibaj*) (Pope, *A Survey of Persian Art,* iii, 1939, p. 2273).

Carpets made for the royal palace exceeded in cost and magnificence anything created or imagined either before or since. Surpassing them all was the so-called Spring or Winter carpet of Khosrau, made for the vast audience hall of the palace at Ctesiphon. It represented a formal garden with its watercourses, paths, rectangular beds filled with flowers, and blossoming shrubs and fruit trees. The body of the rug was silk, the yellow gravel was represented by gold, the blossoms, fruit, and birds were worked with pearls and every kind of jewel. The wide outer border representing a green meadow was solid with emeralds. The rug was about 84 ft. square, and when the great portal curtains were drawn back and the sun flooded the sumptuously decorated and lofty interior (121 ft. high), it must have been a spectacle of overwhelming splendour.

This deployment of the national treasure, which would otherwise have been unproductively locked in dark vaults, demonstrated the power and resources of the king to the ambitious nobles, restless provincial governors, or foreign envoys who gathered in his court. In addition to its political significance and its beauty, happily alleviating the grim winter months, the carpet symbolized the divine role of the king, whose primal task was to regulate the seasons and to guarantee and compel the return of the spring, thus renewing the earth's fertility and assuring the livelihood and prosperity of his subjects. Furthermore, the carpet had still further religious significance: it prefigured paradise (a Persian word meaning "walled park"), for, with its flowers, birds, and water, it personified deliverance from the asperities of the desert and promised eternal felicity.

The carpet was part of the fabulous booty of the Arabs, captured when they defeated the Persians and took Ctesiphon (637). It was cut up into small fragments; one-fifth went to the caliph Omar, one piece to Ali, the Prophet's son-in-law, and the rest was distributed to the 60,000 victorious soldiers, who in turn sold their pieces to a jeweler's syndicate in Baghdad for an average of $3,000 each, counting the drachma as worth only 25 cents. This is on the authority of al-Tabari, one of the ablest of the Arab historians, whose account is confirmed by others and by certain internal and supplementary evidence as well. The original value of the carpet was thus certainly in excess of $200,000,000.

This most sumptuous of all fabrics made a profound impression on all, especially the Persians. It entered as a living, legendary power into history, poetry, and art; and for centuries it served to sustain Persian morale. For more than 1,000 years it furnished the model and inspiration for subsequent carpets, though even the most ambitious could no more than hint at the general design. Of the subsequent renderings of the garden scheme the oldest is a printed cotton panel to be dated between the 9th and 11th century (O. Wulff-W. F. Volbach, *Spätantike und koptische Stoffe,* Berlin, 1926, pl. 130) which shows in miniature essentially the same scheme, and this has persisted down to the present as one of the

18TH-CENTURY GARDEN CARPET FROM NORTHERN PERSIA WOVEN WITH KNOTTED WOOLEN PILE ON COTTON WARP. ITS DESIGN IS PATTERNED AFTER THAT OF THE FAMOUS SPRING OR WINTER CARPET OF KHOSRAU. SIZE: 8 FT. 8 IN. × 12 FT. 4 IN. IN THE VICTORIA AND ALBERT MUSEUM

best-defined carpet designs. The carpets for another of the royal palaces depicted the four seasons, also still a theme of carpet designing down to recent times.

The carpets of the Abbasid caliphate at Baghdad (Harun al-Rashid and his successors) seem almost to have rivaled the carpet of Khosrau. Caliph Hisham, who died in 743, had a silk, gold-enriched carpet that was approximately 150 × 300 ft. (46 × 91 m.). The history of this carpet can be traced for more than a century. It was finally inherited by the caliph al-Mutawakkil about 850. Gorgeous carpets are mentioned in all the contemporary descriptions of the period. Little is known about their actual appearance, but some had inscriptions; some actually attempted symbolic portraiture of the Sasanian kings; and in Numaniya and Hira some were decorated with all kinds of animals, showing a growing mastery of pictorial effects. Dark blue was probably the commonest colour, but the caliph al-Mahdi owned a rose-coloured carpet.

Whether these Sasanian and early Islamic carpets were pile-knotted or tapestry-woven it is impossible to say. There is no evidence to support the usual assumption that they were all done in some kind of flat stitch, but this is possible, as tapestry was by that time a much used technique as well as an old one, being well developed by 1500 B.C. Fragmentary examples, dating from the 7th to the 14th century, have been found on the rubbish heaps of Al Fustat (old Cairo), including some so stiff and heavy that they could only have been floor coverings. Many are very beautiful, with rich and harmonious colours and ingenious patterns.

Various of the Arabic geographers give valuable though meagre information about carpet weaving in the Near East from the 8th to the 14th century. Armenia was certainly one of the most productive districts. There were found good wool, clear water, and fine dyes, especially a scarlet made from the *Coccus ilicis* called *kermes* and widely exported. Armenian rugs were famous in the 8th century, and we know that by the 10th such cities as Devin, Van, Kalikala (Erzurum), Bitlis, Vartan, Aklat, and Tiflis, all produced famous rugs. Marco Polo reported that the Armenians and Greeks in the towns of central Asia Minor (Konya, Sivas, and Caesarea Mazaca) wove the most beautiful carpets in the world, but unfortunately did not describe them.

In northwest Persia, the towns of Khvoy, Bargari, Arjig, Nachshirvan, and Mukhan are all credited with rug production. The south Caspian coast, Gilan, and Mazanderan evidently supported an immense industry. Its prayer carpets were exported widely, and in the 8th century 600 rugs were sent at one time as tribute to the caliph al-Ma'mun.

Rugs were an important part of the equipment of palaces and homes in northeast Persia and in Afghanistan. It is probable that there was local production, but we have no real knowledge of it. In the 8th and 9th centuries, Turkistan, according to contemporary literature, was famous for its carpets which were exported all over the world, particularly to China. Bukhara, Tashkent, and Darzangi are all mentioned as producing fine rugs. Darzangi was especially noted for its tapestry rugs. The designs were probably all geometrical, as in the so-called Bukhara rugs of the day. Wall paintings from the Turfan oasis, from Kizil, and fragments of Manichaean book illustration depict floor coverings with hexagonal and other simple geometric designs.

Southern Persia, Khuzistan, and Fars were also noted for carpet weaving. Basinna and Shushtar were active centres of production. Gundigan, Fasa, Darab, Jahrom, all produced rugs, and the *kilims* (flat-woven carpets) are specially mentioned as of precious quality.

In the 13th, 14th, and 15th centuries Asia Minor and the Caucasus were producing rugs, rather coarse in weave, of strong colour and simple geometric design—stars, polygons, entrelacs, often with border patterns of stylized Kufic writing, and a special group of rugs with simple, highly conventionalized animal forms. The most important of these are a group of three somewhat fragmentary carpets of strong, repeating, geometric patterns in rather harsh colours, red, yellow, and blue, which were found in the mosque of Ala-ud-Din in Konya and are now treasured in the Turk ve Islam Eserleri Muzesi, Istanbul. Local tradition assigns them, reasonably enough, to the period of the Seljuks of Rum, cousins of the Persian Seljuks, who maintained their authority in Asia Minor through the 13th century. In the Staatliche Museen, East Berlin, and in the National Museum at Stockholm are a pair of rugs of very primitive design, the former a highly conventionalized dragon-and-phoenix combat, the latter stylized birds in a tree; both are now generally regarded as Anatolian of the early 15th century, although the patterns were later richly developed in the Caucasus.

A little later there began to appear in Europe, coming from the same as yet unspecified region, a considerable number of rugs of finer weave, more delicate patterns, and richer colours. These also are almost wholly geometrical in pattern. They were depicted by the Flemish painters, such as Hans Memling, Jan Van Eyck, and Petrus Christus, with such skill and loving care that the separate knots are sometimes visible, and the considerable artistic character of the rugs is adequately presented. The designs of many of these rugs have been quite faithfully repeated in the later weavings from the Bergama district in Asia Minor and from the southern Caucasus almost to the present day—an impressive evidence of the conservatism of rug design which so complicates the problem of dating.

2. Persia: 13th–17th Century.—Little is known of carpet weaving of the 13th and 14th centuries in Persia, but by the 15th the art was rapidly moving toward an artistic climax. The horrors and devastation of the Mongol invasion certainly depressed the artistic life of most of the 13th century, which was only partly restored by the magnificence of the architecture and miniature painting of the Il-khan renaissance (1290–1335). The bloody conquests of Tamerlane (Timur) were disastrous to Persia, but he spared and favoured artisans, who were removed in large numbers to work on his great palaces in Turkistan, particularly at Samar-

BY COURTESY OF THE VICTORIA AND ALBERT MUSEUM

DETAIL OF A 16TH-CENTURY ANIMAL-MEDALLION CARPET FROM PERSIA. THE BORDER IS DECORATED WITH DRAGONS, PHOENIXES, CLOUD BANDS, AND SCROLLS. THE FIELD IS A PATTERN OF MEDALLIONS, TREES, AND VARIOUS ANIMALS. SIZE: 9 FT. 8 IN. × 17 FT. 8 IN. IN THE VICTORIA AND ALBERT MUSEUM

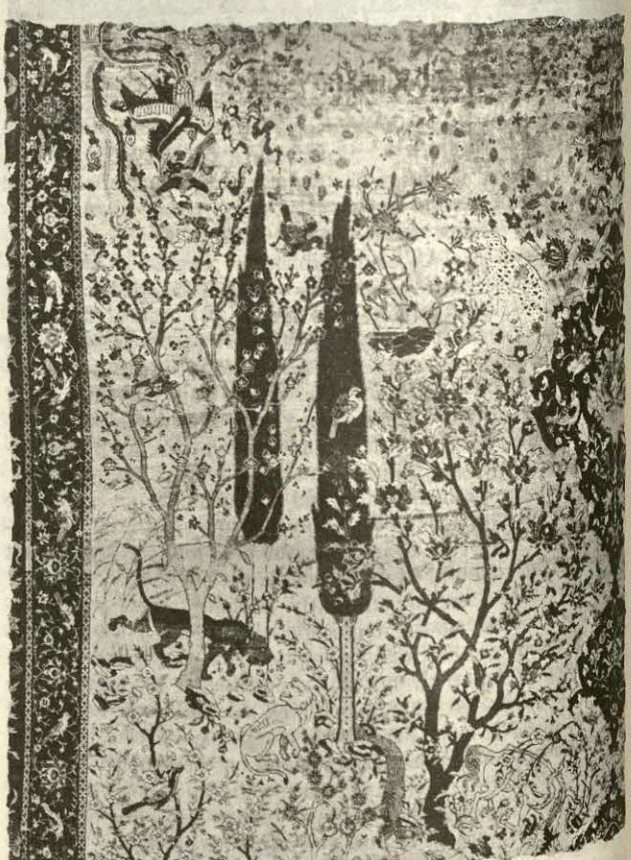
kand and Bukhara, where they were chiefly responsible for a new school of painting and decorative design.

Under the enlightened and cultivated rule of Tamerlane's successors, particularly Shahrukh (1377–1447), literature and art in all its branches flourished, and among the supreme achievements of the following century were its magnificent carpets. These, like most of the finest art of the time, were produced in the palace ateliers or on court-subsidized looms, which made for unity of style. A sensitive and exacting clientele and the lavish royal support guaranteed supreme technical proficiency, the most perfect materials, and the highest skill. Moreover, the materials, both dyes and wool, were of the finest that the unlimited power and wealth of the shah could command. Sheep were specially bred and tended; dye plantations were cultivated like flower gardens; and aspiring designers and weavers could, by submitting cartoons or finished work, win a court appointment which conferred prestige and greatly prized privileges. These conditions, created under the Timurids in the 15th century, remained under the Safavids (1501–1736).

In the 15th century the art of the book, which had long been considered the supreme artistic accomplishment and which already had behind it centuries of superb achievement, reached a degree of elegance and sophistication that it has never known either before or since. The bindings, frontispieces, chapter headings, and, in the miniatures themselves, the canopies, panels, brocades, and carpets which furnished the spaces, all received the richest and most elegant patterning. The great calligraphers and illuminators ranked higher than weaver, architect, or even poet, and generally supervised all artistic enterprises at court. The beautiful designs they conceived were appropriated in various degrees by the other arts and the domination of outstanding artists accounts in no small measure for the special character of the court carpets of the period, the variety of colour, the ingenuity and imaginative range of pattern schemes, and the superlative draftsmanship which is both lucid and expressive.

Because of the difficulty of classification it has been customary to name the great court carpets of the 16th century in accordance with their presumed themes, and we read of "Hunting carpets," "Garden carpets," "Medallion carpets," "Compartment carpets," "Vase carpets," "Animal carpets." This classification is hardly more than a temporary convenience, and really evades the problem. These various themes were embodied in the carpets of many different regions and over long periods. A more serious classification attempts to connect a given carpet style with some dominant cultural unit: the court of a great monarch; the locality in which the patterns were developed; the actual place where the carpet was fabricated, including the sources of design elements. This method is difficult because of the dearth of contemporary documents, and because in a court-supervised art, material was often gathered in one place and shipped to some court-subsidized loom, while court-approved cartoons also were apparently supplied to the various weaving centres, and the provinces also copied the cosmopolitan styles in vogue at the capital. On the other hand, we know from an actual document of Shah Abbas that even at his time (early 17th century) when the imperial dominion was formally established in all matters cultural as well as political and economic, the local weaving centres were respected and the officers of the crown were charged to see that their integrity was preserved. The majority of the more important carpets of the 16th century, in colour, pattern, materials, and technique fall into groups of such marked individuality that we can refer to them as belonging to distinct schools. The complex designs are thought out with perfect lucidity controlled by a rigorous decorative logic. They are in the proper sense a monumental art. Their very size is impressive: the more important of them may be 20–40 ft. long, and in the 17th century, more than 50 ft., though such a size somewhat exceeds the power of unified comprehension. The finest of them are almost all now in museum collections.

The rugs of this period can with a certain confidence be divided into six well-defined groups.



BY COURTESY OF THE MUSÉE DES ARTS DÉCORATIFS, PARIS

DETAIL OF THE PARADISE PARK SECTION OF THE ANIMAL AND MEDALLION CARPET FROM TABRIZ; 16TH CENTURY. IN THE MUSÉE DES ARTS DÉCORATIFS, PARIS

The stately Medallion carpets of northwest Persia, judging by the colouring, the materials, and the subsequent history of the type, seem to have been done in the vicinity of Karabakh in northern Azerbaijan. At the same time a special court atelier, possibly located at Sultaniyeh, as an elusive contemporary document hints, translated into carpets the most gorgeous and varied creations that the illuminators could devise. A dozen or more pieces of this group have survived and they include the world's most famous carpets. Each one is a masterpiece of outstanding artistic quality, superb design, majestic size, purity and depth of colour, and perfection of detail. They all use a fine, crisp, very white wool, probably from Ahar in the extreme northwest, which takes dyes beautifully and which today furnishes the most brilliant wool found in Iran.

The two carpets from the mosque at Ardabil, dated 1539, are the best-known carpets of the period. The greater of the two, skilfully restored, is now in the Victoria and Albert Museum, London. The other, which is reduced in size, is owned by the Los Angeles County Museum. The ornamentation consists of an extremely rich and intricate system of stems and blossoms on a velvety glowing indigo field, which in turn is dominated by a complex golden star medallion.

The Ardabil weaving has a near rival in the Anhalt carpet, named after a previous owner, the duke of Anhalt, and now in the Metropolitan Museum of Art, New York. An intricate star medallion dominates a brilliant yellow field covered with an ingenious system of scrolling arabesques and fluttering cloud bands, framed by a scarlet border. Another pair of carpets from the same region has a scarlet medallion on a white field, which is interspersed with lively animal forms and framed by a dark blue arabesque border. One, unhappily severely damaged during World War II, belongs to the Staatliche Museen, East Berlin, and the other to J. Paul Getty, the American industrialist and collector. An impressive pair, one in the Musée Historique des Tissus at Lyons, and the other in the Metropolitan Museum (the Lyons piece sadly wrecked, and the New York piece mutilated by reduction), is composed entirely of cartouche patterns enclosing in their irregular spaces brilliant little arabesque compositions. The effect is somewhat incoherent but the pair rises to greatness by virtue of the superb finesse of detail and the magnificent colour.

One of the most beautiful of these carpets from northwest Persia is the Animal carpet, half of which is in the cathedral of Cracow and half in the Musée des Arts Décoratifs in Paris, by the same designers and weavers as the Anhalt carpet. It has the same glowing scarlet and gold, but with more subtle halftones (buff on yellow, gray on taupe) and a more pictorial presentation of the paradise park. One of the most striking of the series is the great Tree carpet, also somewhat reduced, which belongs to the estate of C. F. Williams, now in the Philadelphia Museum. Like the Cracow-Paris carpet it is a garden scene, with cypresses and flowering trees of glowing vernal splendour. Historically more important, and in beauty a rival of any, is the great Hunting carpet in the Poldi-Pezzoli Museum in Milan, which carries the inscription: "It is by the efforts of Giyath-ud-Din 'Jami that this renowned carpet was brought to such perfection in the year 1522–23." Again a rich scarlet and gold medallion dominates a field of deep blue, covered with an angular network of blossoming stems, across which in every direction hunters dash after their prey.

The carpets described above, in the opinion of many, represent the supreme achievement in the whole field of carpet designing. None the less, other ateliers under royal direction were also producing many beautiful specimens. One type, also under the domination of the court and possibly done at Tabriz (possibly also at a little town near Hamadan, called Derguzin, in western Persia) reflects even more precisely the art of the illuminator. Some of these are small in size, and all have medallions dominating a field which is covered with very intricate systems of beautifully coordinated two-toned arabesques, with inscription cartouches in the border. The total effect resembles a page from a 16th-century manuscript. More than a score of these have survived. The largest and best-known single example is a beautiful multiple-medallion carpet in the Victoria and Albert Museum (London) which W. von Bode, German authority on art, was inclined to ascribe to the end of the 15th century and to rank as the finest carpet extant.

In Kashan, in the second half of the 16th century, superlative silk Animal rugs were woven, of which three large specimens survive. The finest is the silk-, gold-, and silver-enriched Hunting carpet which is one of the principal treasures in the Österreichisches Museum für angewandte Kunst, Vienna. It is a *tour de force* of both designing and weave. The cartoon was obviously the work of a master painter. Another large piece from the same looms is owned by the king of Sweden and a similar one belongs to the government of Poland. About a dozen smaller pieces of the type are known, each worth many times its weight in gold. The famous so-called Isfahan carpets, which were not from Isfahan at all, were made in east Persia in the vicinity of Herat and Sabzevar. They are the most abundant and most familiar of the so-called classical carpets. The typical field is a very rich claret or dark *rose du Barry*, covered with a pattern of tendrils and graceful lanceolate leaves, framed by a broad border either in deep emerald green or dark blue, carrying magnificently constructed palmettes alternating with lotus or peony blossoms.

BY COURTESY OF THE STAATLICHE MUSEEN ZU BERLIN

DETAIL OF A 16TH-CENTURY VASE CARPET, PROBABLY FROM JOSHAGHAN. IN THE STAATLICHE MUSEEN ZU BERLIN

The beautiful and distinctive Vase carpets were probably manufactured in Joshaghan, north of Isfahan. The pattern structure is generally a series of ogival latticelike systems which carry a profusion of blossoms interspersed with foliage. The glowing blue of the background and the very finely divided clear colours are scarcely to be caught on a colour plate. Only a scant 20 of these carpets have survived intact, among which the example now in the Victoria and Albert Museum, London, is outstanding. These rugs were apparently not exported from Persia but used almost exclusively for court and mosque. They are woven on a solid double warp, which gives them a boardlike stiffness that holds them flat to the floor—a desirable feature for a carpet. They are still called in Iran "Shah Abbas carpets." The style (which was indigenous, very ancient, and characteristically Persian), reinforced by the prestige of the court, exercised a wide influence, and derivatives appear in Kurdistan, the Caucasus, and even in the embroideries of Bukhara, as well as in the court carpets of India.

There are other beautiful carpets of the 16th and early 17th centuries for which the provenance is still doubtful. Magnificent rugs were, we know, woven in Kerman, Yazd, and Fars, and perhaps Khuzistan, but just what they were like we can only guess, as we have no extant example that can with any surety be assigned to any of these places.

From time immemorial, the rugs of Persia had been enriched by gold and silver thread, a device that was discreetly used in some of the 16th-century carpets from east Persia, but by the time of the mighty monarch Shah Abbas I (1571–1629) many sumptuous carpets were woven from silk interspersed with silver and gold. The most gorgeous of these is the so-called "Coronation carpet," still preserved in its pristine splendour in Rosenborg Castle in Copenhagen. The gold background gleams as brightly as the day it was woven and the velvetlike pile, with its accurately drawn arabesques, is no less perfect.

All these carpets were made specially for the court or for great nobles, who could afford to concentrate on perfection and disregard the often considerable expense; indeed, a carpet like the Ardabil or the Austrian Hunting carpet cost as much as a small palace. They were cared for by special custodians, brought out only as

BY COURTESY OF THE ROYAL COLLECTION AT ROSENBORG CASTLE, COPENHAGEN

actually needed, often for state occasions only, and even when the king sat on them they were generally partly covered with a lighter fabric for complete protection. The mosque carpets had severer and more continuous use. Carpets that reached Europe were for the most part treasured with equal solicitude. They were precious items in royal treasuries like the Austrian Hunting carpet, which Peter the Great gave to the emperor of Austria, the Danish Coronation carpet, or the Anhalt carpet, which are all almost as fresh and perfect as the day they were taken off the loom.

As the 17th century wore on, both the demand for more luxury and the increasing wealth that sustained it multiplied the manufacture of gold- and silver-threaded carpets until they were not only available for purchase to ordinary civilians in the bazaars, but were exported in great numbers to Europe, where more than 200 of them have been found. They are closer to the European Renaissance and Baroque idiom, with their high-keyed fresh colours and obvious opulence, and the finest of them are indeed beautiful. A large number of them were exported to Poland, for Poland had very close relations with Persia in the 17th century and Polish royalty and nobility ordered gold-threaded rugs of this type from the looms in Kashan. There had been a rug weaving industry in Poland in the 18th century and also a silk weaving industry which used gold thread. So when these Polish rugs were first exhibited at the Paris exposition in 1878 it was natural to think that they were really Polish, for nothing quite like them had at the time been found in Persia. They were accordingly labeled *Tapis polonais,* and the name has stuck to the type ever since. Actually, they were primarily a product of the looms of Kashan but were probably also woven in the royal shops in Isfahan. The style degenerated rather rapidly. By the second half of the 17th century materials were cheapened, weaving became coarser and more careless, the designs clumsy and confused.

Similarly the east Persian Herat carpets which came into the European market by way of India and the gulf export trade, partly in Portuguese, partly in English control, became known in Europe as the typical Persian carpet. Many of the European artists of the period owned them, and Van Dyck and "Velvet" Brueghel (Jan the Elder), particularly, rendered them with complete fidelity in datable paintings. The Indian princes also were enamoured of them and acquired them by plunder and purchase alike. Their popularity resulted in mass production with all its attendant deleterious effects. Designers were no longer employed, cartoons were wearily repeated *ad infinitum,* the weavers had little interest or pride in their work, the desire for speed and for economy debased every process, and the style finally expired in a repulsive mediocrity, a painful example of how a great art can be brought to ruin.

Throughout Persia as a whole during the 17th century there was an increasing emphasis on refinement and luxury coupled with a steadily slackening inspiration. The set of silk carpets woven to surround the sarcophagus of Shah Abbas II (d. 1666) in the shrine at Qom is the last really high achievement in Persian rug weaving. The rugs are of such finesse that even orientalists have mistaken them for velvet, and the drawing is beautiful, the colour varied, clear, brilliant, and harmonious. The set is dated and signed by a master artist, Nimat'ulla of Joshaghan.

3. The Low School Rugs of Persia.—By the end of the 17th century the impoverishment of the court and the general slackening of cultural energy throughout the Near East are clearly reflected in the steady decline of court art. Nonetheless, throughout most of western Asia wandering nomads and settled town dwellers alike continued to design and weave carpets, using dye methods that had been developed and tested through centuries. Each group retained its characteristic pattern, content to maintain its artistic tradition with little embellishment. These humbler rugs, the so-called "Low School" types, were not made for an impatient western market and are frequently of a very high artistic character, beautiful in colour and design, and of fine material and excellent technique. Their provenance is not always certain. Names are attached to rugs in the international markets at Istanbul, Smyrna, and Tabriz, and frequently do not correspond to the actualities. Different and contrasting rugs are often woven in closely related districts, such as Bijar and Sehna, while similar rugs may be woven in districts far apart. The nomadic wanderings, the forcible transfer of populations in the 18th century, tribal intermarriages, and many other factors have tended to confuse the type and conceal their true origins. Perhaps as many as 50–100 types were woven in the 18th and 19th centuries. A few of the better-known types may be briefly designated.

Kashan, noted for its fine textiles as early as the 12th century, was producing sumptuous velvets and even more sumptuous silks by the 16th, and by the 17th the silver- and gold-threaded rugs called *Polonaise* carpets (see *Persia,* above). The skill and tradition survived and Kashan has produced the finest woven, most elaborately designed, and most richly coloured rugs of recent times. Their high cost restricted the output and the best of them were finally crowded out of the market.

The principal weaving centres in the 19th century were Tabriz in the northwest, Joshaghan in central Persia, Kerman and Ravar in the southeast, and Meshed (Mashhad) in the northeast. These centres have all woven large carpets, Meshed, Kerman, and Tabriz utilizing the medallion schemes of early classical time, Joshaghan and some Kerman carpets repeating various interpretations of the garden motive. The most characteristic Joshaghans were distinguished by flower sprays, very precisely drawn, on a field of soft red.

The Kerman rugs were made of brilliant wool, finely and skilfully woven, and, beginning about 1870, they became the most popular of all the Persian weavings. They are light in tone, thanks to the discreet use of light ivory and pale rose, and were particularly in demand for western drawing rooms.

CAUCASIAN RUG

Section of a Kula rug from the Caucasus; 17th century. The style is a derivative of the dragon-rug tradition but is more floral in pattern and employs a highly abstract outline of form. In the collection of Joseph McMullan

is ideally fitted for rug weaving, excellent wool, water, and dye plants being readily available. Among the more important are those from Qareh Dagh (or Karadja), where the weavers remained faithful to the highest ideals until they went out of production. The region around Ardabil produced many handsome nomadic rugs difficult to identify. South of Ardabil the principal types have been the so-called Heriz, Gorevan, and Serapi carpets that make liberal use of tan and blue in bold and simple patterns.

The Kurdish region in northwest Persia produced many fine medium-sized rugs in thick lustrous wool of fine colours, repeating the designs of other parts of Persia. From the immediate vicinity of the town of Sehna (now Sinandaj), in the heart of the Kurdish district, have come finely woven carpets and kilims. The patterns are exquisitely rendered medallions or *bouté* (the so-called pear or palm leaf motive), with imbrications.

A great rug industry was developed in western Persia in the Soltanabad district. From individual towns come beautifully woven rugs like the Sarouks, with their ancient medallion pattern; the Sarabands, with their repeating *bouté* patterns on a ground of silvery rose; and the Feraghan, with their so-called Herati pattern —an allover, rather dense design with a light green border on a mordant dye that leaves the pattern in relief. The earlier Feraghans (two are known, dated at the end of the 18th century) are on fields of dark lustrous blue with a delicately drawn open pattern. Later, toward the end of the 19th century, Feraghans degenerated in colour and material and the pattern became clumsy and crowded.

From the province of Fars come many small rugs and a few sizable carpets, reflecting ancient models. The Bahtiari region west of Isfahan turned out a few large, double-warp, stoutly woven carpets and a few smaller rugs that occasionally attained very great merit. Northeastern Persia from Meshed down to Birjand and Ghayian produced large carpets predominantly violet or purplish in tone with wide multiple borders and very soft and not too durable wools.

The "Low School" rugs maintained their standards down to the latter half of the 19th century when their near ruin as art was completed by western commercialism with its insatiable demand for quantity, cheapness, and speed. Western taste also intruded destructively, and European importers began to supply designs with confused or meaningless patterns, and to order shapes and colours that were in conflict with the Oriental tradition. Competition was intensified and the weaver reduced to an animated machine. Aniline dyes, harsh and fugitive, displaced the older, far more costly dyeing processes. Poor wool was cheaper than good, and various processes of chemical washing temporarily concealed the deficiencies and imparted an enticing sheen to the carpet which

KERMAN RUG, 19TH CENTURY, WITH FIELD AND BORDER PATTERNS OF TREES AND FLOWERS. SIZE: 9 FT. 9 IN. × 13 FT. 2 IN.

the unsophisticated thought charming. However, the more intelligent European importers were aware of the destructiveness of such practices and endeavoured to arrest the deterioration of the craft and to restore something of the old quality, though the factory system was by then too well established ever to be displaced. The Persian government made several sporadic attempts to contest commercialization and imposed severe penalties for the use of aniline dyes, but the commercial tide was not so easily checked. Later, however, the government made a much more systematic effort to revive the art, with considerable success. A school of design under Taherzadeh Behzad in Teheran based its work on faithfully studied 15th- and 16th-century models. Sound methods of dyeing, wool selection, and testing are taught and the school graduates go into the various rug producing districts to improve their standards. In various places the original, indigenous methods have been maintained, and, particularly in Meshed and Birjand, carpets are woven which for technical competence and in beauty of colour stand comparison with the 17th-century weavings. The art of designing great carpets, however, is not so quickly recovered. The tendency to overelaboration needs to be curbed by a more sympathetic study of the early models with their aristocratic restraint and the fundamental strength of their designs.

4. India.—Very little is known of early and indigenous carpet weaving in India where it was apparently a late development. As an art it was brought from Persia by the Mughal princes in the 16th

and 17th centuries. The emperor Akbar set up royal looms that were thought to surpass Persia's finest, although, as his biographer Abu'l-Fazl tells us, rugs were still imported from various centres in Persia. The Herat carpet-weaving establishments that made the so-called Isfahans, being the nearest centre of manufacture to India, furnished models. Apparently weavers were brought from there to continue the style in India, where it was rapidly crystallized, with the elements reduced and formalized, the drawing rigid and meagre. Colours and wool also deteriorated while there were few compensating additions from Indian sources.

The carpets made for the courts of the Grand Mughals, however, were of extravagant and luxurious beauty. The cost of fine weaving was quite ignored and a series of carpets turned out with 800 to 1,200 knots to an inch, which provided a luscious velvety texture. Special carpets were of even finer weave and a fragment of prayer rug has survived (Altman Collection, Metropolitan Museum, New York) which has the incredible fineness of nearly 2,400 knots to an inch. Master draftsmen, designers, and dyers were employed and no aspect was neglected. Shah Jahan (fl. 1627–58), for example, had a set of rugs made for his palace at Amber which were manufactured from the most precious wool, imported from Kashmir and from remote Himalayan valleys.

But the art was young and its sources were in imitation, not in the life roots of the people. The standards of taste were imposed from outside and were assimilated only by a few so that, despite the magnificent models they were worked from, despite the limitless subsidies which they could command, these wonderful fabrics never reached the artistic height that characterized many periods of Persian weaving. The patterns are often too disorganized and the aim was too pictorial; the stately palmettes and curving leaves of Persian carpets, which were in themselves noble and significant compositions, are reduced in Indian carpets to a meticulous botany,

faultless in detail but too photographic to sustain any poetic fancy.

The rug industry, once established, continued down to the present. It became a jail industry, particularly in the Punjab. The designs were increasingly meagre and the art could no longer sustain comparison with the Persian weaving.

The later Indian carpets are mostly very inferior, largely on account of the difficulty of obtaining good wool. Many still have the designs of Persia and of other countries but purely Indian patterns are also common. From time to time better carpets have been made in the factories and during the 19th century the government established a fairly successful manufacture in the jails, but it is rarely that in both design and quality they rival the better products of Persia. The best come from Agra and Warangal, the latter producing some good silk rugs. Carpets from Masulipatnam, Mirzapur, and Thanjavur (Tanjore) are very cheap and very substantial but the wool is harsh and the colours so dull and gray that they are quite unattractive. Cotton rugs are made in Multan, and tapestry-woven ones, called *daris,* in many places. During the 20th century carpets of good quality, with any desired pattern, are being made in Kashmir, where some handsome reproductions of famous classical carpets have been made.

5. Turkey.—Turkish rugs, after the 16th century, were of two markedly contrasting types, those following Persian designs and possibly the work of imported Persian and Egyptian weavers, and those with indigenous designs. The former were made on court looms and display exquisite cloud bands, feathery lanceolate leaves in white on grounds of pale rose relieved by blue and a deep emerald green. The more indigenous Turkish patterns are embodied in large and handsome carpets made for mosques and the residences of noblemen. Characteristic are their rich, harmonious colours and their broad, rather static, pattern. These latter contrast quite markedly with the lively and intricate movement of Persian designs, where primary, secondary, and tertiary patterns are often played against one another in subtle dissonances and resolutions.

Turkish styles are best illustrated in the Usak carpets, ornamented complex star medallions in gold and yellow and dark blue centring on a field of rich red. The "Holbein" carpets, which are somewhat similar to the Caucasian carpets, have polygons on a ground of deep red, often with green borders and a conventionalized interlacing Kufic. Such a carpet is shown in Holbein's famous portrait of Georg Gisze and accounts for their name. Similarly, a handsome carpet of interlacing yellow arabesques on a ground of deep red appears so often in the paintings of Lorenzo Lotto that the rugs are now designated as "Lotto" rugs. From some unidentified region, perhaps Bergama, come rugs with a muffled, deep red ground of wonderful depth and intensity, patterned with small medallions. In the 17th century this type developed into that known as Transylvanian, because so many of them, particularly prayer rugs, have been found in the churches of Transylvania. However, they are purely Turkish in feeling and have the Turkish merits of rich, quiet colour and sturdy designs, which, aside from prayer panels, vases, and conventionalized foliage, are ultimately

of Persian derivation. The majority are dominated by a fine red but a few are now faded to the colour of old parchment.

The 17th century saw the development of another characteristic type, erroneously called a Bird rug because the highly conventionalized floral pattern of arabesques does suggest a bird. The few rugs that have survived are serenely beautiful; the field is of soft ivory white and all the colours discreet.

The Low School rugs of 18th- and 19th-century Asia Minor continued to show the earlier qualities of quiet and sober patterns and luxurious colour. Some of the 18th-century weavings still faithfully follow the simple geometrical patterns of the 15th century. But the chief output of the Turkish weavers were prayer rugs, with which the Turks were more lavishly supplied than any other of the faithful. Handsome carpets were woven in Melas, Konya, Ladik, Kirsehir, and Sivas, those of Ladik being the most brilliant, both in pattern and colour. The most famous prayer rugs came from the towns of Ghiordes and Kula, mostly in the 18th and 19th centuries, and in the United States became the first passion of the collector. Regions like that of Smyrna (Izmir) produced a great many utility carpets for the western world.

6. The Caucasus.—Fine rugs were woven in the Caucasus from earliest times. Later Persia became the dominant political and cultural power in the region, a position it held for many centuries, and the magnificent carpets produced at the Persian court furnished models for the more ambitious Caucasian carpets such as those woven for the local nobles, or khans. However, the Caucasus has its own individual character and while it took motives from other sources, such as the dragon and phoenix fighting (so common in Persian illuminations), sun-burst medallions, lattice-like field divisions derived from the Vase carpets and other sources, or repeating lotus forms often in huge scale, all these contributory elements were completely transformed by a furious vigour of design which is without equal in the textile world.

One of the most famous weavings, the Dragon design, seems to have come from the great weaving town of Kuba. Perhaps because of questions of expense (for the little Caucasus kingdoms could never compete in luxury with sultans or shahs) Caucasian rugs were of coarse weave, the Kuba Dragon carpets being not infrequently less than 80 knots to the square inch. The designs therefore were much simplified but are nonetheless remarkable for their powerful originality.

The Low School rugs are among the most individual and satisfactory. Their patterns are practically all geometrical, densely juxtaposed, generally without organic connection, and without implied movement, but they are clear, ingenious, and entirely suitable for floor decoration. The more recent examples seem a little dry in colour but many of them, like the rugs woven by the Kazakhs, Sarouks, and other nomads, are sometimes of flaming brilliance, and the older rugs from Dagestan, Kuba, and Shirvan

are done in beautifully clear, discreet, and well-balanced tones.

Kilim or tapestry rugs were woven all over the Near East, but the most artistic come from the Caucasus. The Shirvan kilims, with their broad horizontal stripes, have bold motives assembled in harmonious colours.

A more important type of flat-stitch carpet, embroidered and with a mass of loose threads at the back, which comes from the region of the ancient fortified city of Shemakha, has been improperly called cashmere because of its superficial resemblance to cashmere shawls. The design is most often composed of large, beautifully articulated mosaic tile patterns in rich and sober colour, the descendant of the carpets that so delighted Memling and Jan Van Eyck. (A. U. P.; X.)

7. Central Asia.—The carpets of western Turkistan are made by nomadic Turkmen tribes and few extant examples go back more than 100 years, though it is almost certain that similar rugs have been made for centuries. Turkmen rugs are easily identified, for excepting the Beluchis, they all have a dark red colouring and geometric designs. Many of the older pieces are not really rugs at all: some were hangings for tent doorways while others are just bags used for storage in the tents or on the pack animals. Those called camel bags measure about 5 × 3 ft., and the tent or wall bags 3 × 1 or more. Saddle bags consist of two squares of about 2 ft., joined together. There are also long bands about 1 ft. wide and perhaps 60 yd. long, which are for wrapping round the large tents. The small squarish rugs and larger ones of about 10 × 7 ft. seem to be later in date and were made perhaps chiefly for sale. The Turkmen carpets (wrongly called Bukhara) have woolen warp, weft, and pile, two lines of weft, and are nearly always made with the Sehna knot. They are surprisingly well woven in view of the fact that they are made by nomads with only the most primitive appliances. After the predominant red, the chief colours are blue, white, and a natural black wool that tones to a very pleasant brown. The characteristic design is the octagon—or so-called elephant's foot—arranged in rows and columns, often with diamond-shaped figures in between. The doorway hangings—called Tekkes—have cross-shaped paneling and the smaller pieces

often have a rectangular diaper. Woven end webs and tassels are freely used as embellishments. The best classification is on a tribal basis.

Tekke.—These are often very finely woven, sometimes with 400 knots to the square inch. The principal colour is a deep muffled red.

Yomud.—Of medium fineness, mostly with the Ghiordes knot. The chief colour is a purple red, and there is a good deal of white, especially in the border. In the pattern diamonds often displace the usual octagon. The long tent bands, which have the pattern in pile on a woven ground, belong to this group.

Sarouk.—Like the Tekkes but with an almost black-purple or very deep crimson colouring, together with some very prominent white. Not very common.

DEUTSCHE FOTOTHEK, DRESDEN

DETAIL FROM "MADONNA WITH ST. CATHERINE" BY JAN VAN EYCK SHOWING RUG WITH LATTICE PATTERNING, A 15TH-CENTURY DESIGN FROM THE SOUTHERN CAUCASUS

Ersar.—These are rarely large pieces. The chief colour is a brown-red; dark green and a little bright yellow are characteristic. The patterns are very varied, with a tendency to zigzags, diagonal lines, and spotted effects.

Afghan.—Mostly large rugs with long pile and a pattern of large octagons arranged in columns; akin to the Ersari.

Beshir.—A rare type apparently made near Bukhara, with rich colouring, including a lot of yellow, and patterns apparently based on the Persian. Many are prayer rugs with a characteristic pointed arch. Large carpets are more common.

Beluchi.—These differ from the other Turkmens in that they have a black weft and dark purple and red colouring, sometimes with natural camel-colour and very staring white. The patterns are almost geometrical but the prayer rugs often have tree forms. Most of them come from eastern Persia in the vicinity of Khvaf near the Afghan border.

8. Chinese Turkistan.—The earliest rugs of Chinese Turkistan date from the 17th century and mostly have a silk pile and some metal and gilded thread. The patterns are formal floral ones, based on the Persian but with unmistakable Chinese treatment of the detail. The later carpets are loosely woven with the Sehna knot, wool or, more rarely, silk pile, and a cotton warp. The 18th-century examples have rich but dark colouring, which during the 19th century gets gradually more vivid until at last it becomes excessively crude. There are two important types of design:

Medallion.—These usually have three medallions placed down the centre of the rug, each being almost square in shape. One border almost invariably has a conventional Chinese pattern of foam-crested waves. This pattern is mostly called Samarkand in the trade, but the rugs themselves come from Kashgar and Yarkand.

Five Blossom.—These have a floral diaper with characteristic groups of five blossoms. The colouring is often richly red and orange with a little clear blue.

9. China.—The rugs of China proper are easily recognized by their characteristic Chinese ornament. They are of coarse texture and are woven with the Sehna knot on a cotton warp; the pile is thick with a very smooth surface. A peculiar feature is the clipping of the pile so as to form a furrow at the contours of the pattern. The prevailing colour is yellow, sometimes intentional but often resulting from fading of shades of red and orange. Blue and white are also freely used but there is little true red, brown, or green.

Some of the carpets have repeating scrolling plant forms. Others have scattered flowers, medallions of frets, and the countless symbols that are so familiar in Chinese art. Frets of the Greek type are very common in the border. Pillar carpets are peculiar to China. They are designed so that when wrapped round a pillar the edges will fit together and give a continuous pattern, which is usually a coiling dragon. Many small mats, seat covers, and the like are found. It is almost impossible to date Chinese rugs as patterns have varied very little with time, and internal evidence is almost nonexistent. During the 20th century numbers of large carpets have been made for export.

10. Morocco.—Large carpets, twice as long as wide, are made in Morocco. They are loosely woven with very bright but mostly faded colours. The field is often cut up into rectangular panels filled with ornaments taken directly from Turkish carpets.

11. Spain.—Carpets seem to have been made in Spain as early as the 14th century. They are made entirely of wool. The knot is tied, or rather twisted, on one warp thread instead of on two, and the weft passes several times after each row of knots. The colours are bright and few in number, little being used but yellow, blue, red, and green. The designs are based either upon Oriental models, such as the geometrical Turkish ones, or upon purely Spanish ornament. The latter frequently introduces heraldic motifs. One early type of long rug has shields of arms on a field with a honeycomb pattern introducing plant forms and birds. A common design is a succession of foliated wreaths; another is a diaper of ogee compartments containing the floral device known as the "artichoke." Few knotted pile carpets seem to have been made after the 17th century, but small rugs woven in narrow breadths with a looped pile were common until very recently. They come principally from Las Alpujarras in the Pyrenees.

12. United Kingdom and Ireland.—The art of making handwoven carpets in England soon followed their importation from Turkey, though actual specimens of the 16th and 17th centuries are so rare that only about a dozen complete rugs are known. They have a hempen warp and

weft and woolen pile of medium fineness, tied with the Ghiordes knot. The ground is usually green and there are so many shades of the other colours that the whole number of tints is greater than in Oriental carpets. The designs may be divided into two groups. In the first are found typical English patterns resembling contemporary embroidery, and often introducing heraldic devices and, fortunately, dates. The earliest known carpet of this type belongs to the earl of Verulam and is dated 1570. Large numbers of pieces of carpet knotting—called at the time "Turkey work"—were made for covering chairs and stools. As the demand for carpets increased in the 18th century small factories were started at Paddington, Fulham, Moorfields, Exeter, and Axminster, and the home production was stimulated by premiums offered by the Society of Arts in 1756. The designers continued to adopt the decoration of the time or to copy Eastern carpets. The famous Axminster factory worked on well into the 19th century and then became merged into the Wilton factory, which is still in operation. With the advent of machinery the industry dwindled and almost disappeared until, about 1880, the craft was revived by William Morris. Quite late in the century a successful factory was opened in Donegal, Ire., and during the 20th century many small rugs have been knotted by handicraft societies, though their products can scarcely compete commercially with the machine or with the Oriental rug.

CHINESE PILLAR CARPET

Dragon pattern is designed to fit together when wrapped around a pillar. Good luck symbols are represented at the top of the carpet and earth and water at the bottom. In the Victoria and Albert Museum

13. France.—There are early records of carpet weavers in France, but nothing is known of their work until the foundation of the famous Savonnerie factory near Paris in 1627. Many large carpets were made there, mostly with flaxen warp and weft and a woolen pile tied with the Ghiordes knot. The designs accord with contemporary French decoration and few, if any, were based on Oriental carpets. In 1826 the factory was closed and the manufacture transferred to the Gobelins tapestry factory. During the 18th century and afterward many tapestry-woven carpets were made at Aubusson and in other tapestry factories.

14. North America.—Many of the Indian tribes have been making flat-woven rugs and blankets since the earliest days of their known history. Before sheep were introduced in the 16th century the principal material was cotton, together with various fibres and dog's hair; afterward wool became important. Among the most skilful tribes are the Pueblo and the Navaho (*q.v.*). Indian designs are traditionally abstract ones which make much use of stripes and a zig-zag, or "lightning," motif. The colours used are black, white, yellow, blue, tan, and red, the latter often being dominant.

Rugs were made by the colonists in a variety of techniques—by knitting, crocheting, or braiding thin strips of material into small squares and then sewing these together, or by embroidering on a coarse-woven foundation. Hooking began around the turn of the 18th century and became very popular. The early examples have crude floral, geometric, or animal designs and are very colourful.

No knotted carpets were manufactured among the Indians—nor among the settlers in the early days. However, in 1884 a factory established in Milwaukee (and later moved to New York City)

WOOLEN CARPET FROM THE SAVONNERIE FACTORY, FRANCE, 19TH CENTURY. DESIGN SHOWS A BASKET OF FRUIT ENCIRCLED WITH ROSES AND RESTING ON ACANTHUS LEAVES WHICH SUPPORT FLAMING TORCHES. SIZE: 8 FT. × 11 FT. 2 IN. IN THE OSTERREICHES MUSEUM FÜR ANGEWANDTE KUNST, VIENNA

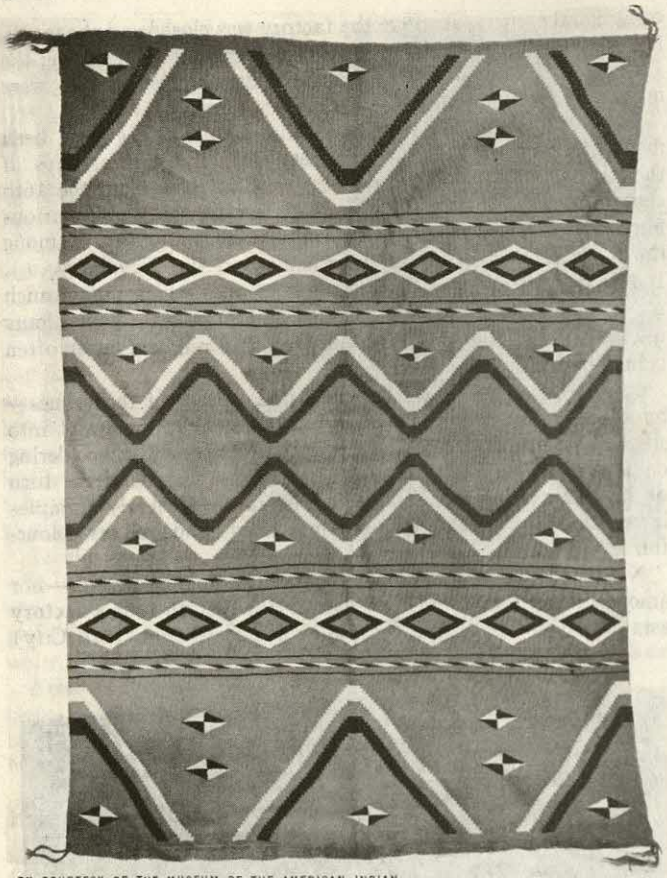
began to weave carpets in traditional European designs. During the 1890s a branch of the Royal Wilton Carpet Works made Axminsters at Elizabethport, N.J., and a few beautiful, flat-woven carpets in French Baroque and Neoclassical designs were produced around the turn of the century by a tapestry factory in Williamsburg, N.Y. After this machine weaving, which had begun in the U.S. as early as the second half of the 18th century, gradually ousted hand weaving.

15. Other Countries.—A few carpets made in Poland in the 17th century are still in existence; they have floral patterns in light colouring. In Finland loosely woven rugs, often with human figures and dates, were made by peasants and seem mostly to have formed part of bridal dowries. Kilims are made in the Balkan states and in southern Russia; they resemble the Turkish pieces but have, especially the Russian, more naturalistic floral patterns. Those from Rumania generally include birds in the design.

(C. E. Ta.; X.)

II. TECHNIQUE AND DESIGN

1. Knotted-Pile Technique.—From very early times weavers have produced pile fabrics, in which they have endeavoured to



BY COURTESY OF THE MUSEUM OF THE AMERICAN INDIAN

NAVAHO INDIAN WOOLEN RUG INCORPORATING THE "LIGHTNING" MOTIF IN ITS DESIGN. SIZE: 3 FT. 4 IN. × 4 FT. 10 IN.

combine the advantages of a woven textile with those of an animal fleece. The pile has been formed by many varieties of looping, knotting, and weaving.

On the basis of the central Asian finds it was formerly thought that the single-warp knot was probably the earliest type used for carpets. By the early Middle Ages this knot had reached the east Mediterranean, for it is found in pile carpet fragments recovered from the Al Fustat refuse heaps. A fine example (Musée Arabe, Cairo) bears on a dark blue ground an inscription in white Kufic letters which makes it datable in the late 9th or early 10th century. Not long thereafter the technique was carried into Europe and was used in Germany, at Quedlinburg, at the end of the 12th century, for a hanging illustrating an allegory centred on Mortian's *Marriage of Mercury and Philologia* (Ackerman, *Tapestry*, 1933, p. 33). Moreover, by the beginning of the 14th century *tapisserie sarrazinoise* is discussed in industrial statutes, and clearly differentiated from both *tapisserie nostre* and *haute-lisse* (true tapestry). Evidently looped-pile weaving continued in Europe (*ibid.*, pp. 312–313). The same technique was still in use in Spain in the 17th century. Meanwhile, in Egypt, and probably other east Mediterranean centres also, two other forms of looped weaving were being developed which made either a potential pile (uncut pile) or actual long-ended pile surface. One of these, practised in two variants, was a forerunner of velvet. In this a supplementary weft for the pile is carried on top of regularly spaced foundation wefts (from the fifth to the ninth in general) and passes under a certain number of warps to hold it firm (from three to six overpassed warps, as a rule), then is deeply looped over a single warp, and so repeated; or alternatively, it is deeply looped between two warps. But the second of these loop weaves contains the germ of the development of true rug-knotting form. This, the supplementary weft, after passing under a certain number of overpassed warps in the same way (*e.g.*, two), is then floated over a certain number of them (*e.g.*, two or three), and is carried back under the same number of warps. This leaves a cut end at the beginning of the unit (of say seven warps in all), and another in the middle thereof—a coarse version of the knot that came to be known as the Persian knot. The two techniques were used equally for garments and wall hangings but the latter was used also for carpets as is shown by a good-sized specimen in the Metropolitan Museum from Antinoë, datable *c.* A.D. 500–600, with a broad conventional polychrome design (M. Dimand, in *Metropolitan Museum Studies*, iv, pp. 159–161 [1932–33]).

It now transpires, however, that the earliest known carpet, that from Pazyryk, was worked with the so-called Turkish knot, and this knot has also been found in some of the early specimens excavated in central Asia. It appears again in the later Middle Ages in the Ala-ud-Din carpets. Moreover, by the end of the 15th century it had penetrated Europe, for a fragment of an Annunciation, probably Flemish, possibly French, is in this technique (E. B. Sachs in *Metropolitan Museum Studies*, i).

In these fully evolved forms of the technique the pile yarn, instead of being wrapped around a single warp, is knotted around two. These warp threads—most often cotton, but in both Spanish and Near Eastern nomad rugs sometimes wool, or in some finer qualities, silk—are stretched vertically on a loom and a length of the pile yarn is tied on every two threads the full width of the loom; then two or more weft threads likewise of any of the materials cited, or of a combination thereof, are cloth woven (alternately over and under), back and forth across the full width, two or more times, and the process is repeated. There are thus three sets of threads involved, each with its specific function: warp, weft, pile. The pile is usually wool but may be silk or cotton, though the last is not desirable except for very small areas where the crisp accent of an unfadable white is wanted. In the Turkish pile knot the yarn is passed under one warp, back over two, and back again under the second so that both ends come up together between the two warps on the same side of the overpass loop. In the other type the yarn passes under one warp, over and back under the next, so that the two ends stand on the surface with one warp between them. The pattern is obtained by changing the colour of the pile yarn. When a row of knots is tied it is beaten down against the preceding rows with a heavy malletlike comb so that, on the front, the pile completely conceals both warp and weft. When a certain area is woven, the pile ends are sheared to an even height. This varies according to the character of the rug, being short on the more aristocratic type of rug, and as much as an inch on some shaggy nomadic rugs. (*See* further CARPET MANUFACTURE: *Handmade Carpet.*)

FIG. 1.—BASIC KNOTS AND WEAVING PATTERNS USED IN HANDWOVEN RUGS AND CARPETS

(A) Spanish or single-warp knot; (B) Turkish or Ghiordes knot, and (C) Persian or Sehna knot, the two types used in Oriental carpets; (D) Tapestry weaving; (E) Shemakha weaving, a modified form of the tapestry method

The fineness of the weave depends on the number of knots to the square inch which itself varies according to the weight and spacing of the warps and also, though to a lesser extent, of the wefts, and on the thickness of the pile yarn. The range is from about 80 to the square inch, used for instance in some of the Kuba Dragon carpets of the late 16th or 17th century (see *The Caucasus*, above), to more than 2,400, found in a fragment of a Mughal prayer carpet of the 17th century, obviously an emperor's property (Altman Collection, Metropolitan Museum, New York). But the most finely woven carpets are by no means those of greatest artistic or historic importance; for example, the beautiful and famous pair of carpets from the mosque of Ardabil (dated 1539) have only

about 325 knots to the square inch (see *Persia*, above).

In certain types of pile rugs, both wool and silk, some areas are brocaded with gold or silver thread, usually cloth woven but with a surface float over several warps (basket weave) to obtain the maximum richness. In these the weft is carried forward over four of the warp threads and then backward behind two. This gives a kind of herringbone texture at the front and a series of ribs at the back of the fabric. Because a weft looped around the warp threads as described has much less than the usual binding effect, alternate wefts are cloth-woven, but these are concealed by compacting the loop-woven wefts, which are changed in colour according to pattern as in straight tapestry weaving.

The time required for weaving rugs has been very greatly exaggerated. They are often spoken of as having required lifetimes, but a careful check made by Heinrich Jacoby (*A Survey of Persian Art*, iii, 1939, p. 2464) shows that even the finest carpets would hardly have taken three years. Even the huge Ardabil carpet, with its 33,000,000 knots, could have been woven within four years. Great carpets like the Milan Hunting carpet probably only required a year and a half.

2. Hooked Rug.—The origin of the hooked rug is obscure. A rug of this type is made by pulling narrow strips of wool or cotton cloth or wool yarn, with a tool roughly resembling a buttonhook, up through a basic material of coarse linen or burlap. The loops, approximately ½ in. high and the width of two, three, or four mesh openings in the basic material, are often clipped. Frames of various designs hold the basic material taut. Frequently the rug is made by pushing, instead of pulling, the loop through the basic material, the instrument used being then generally a large threaded needle.
